THE best means of sending news rapidly, in a country with such bad roads as Greece, was by *trained runners*. Thus we are told that Phidippides, a professional courier, ran from Athens to Sparta to beg for aid, just before Marathon, arriving at the latter city at the end of the second day; and this was a distance of one hundred and fifty miles. The constant gymnastic training in which Greek, and especially Spartan, soldiers kept themselves, enabled whole armies to make very rapid forced marches. In the present instance, the Spartan army, though slow to start, yet, when it did march, performed the distance in three days. So, the old Chasseurs de Vincennes, the picked light troops of the French army, were trained to make swift marches by running one on either side of a cavalry soldier, whose

stirrup-leathers they caught hold of. This, we believe, or something like it, is still kept up among the zouaves. The episode of the Fiery Cross, in the "Lady of the Lake," shows how quickly a district may be aroused by a well-organized system of running messengers. Indeed, the swiftness of rumor is as proverbial as its exaggeration. Lady Duff Gordon, in her voyage up the Nile, found that the news of her approach invariably outstripped her movements, rapid as they were. The curious story, given by Herodotus, of a herald's staff found floating on the sea at Mycale, and of the rumor that straightway ran through the Greek host of a battle won by their countrymen in Greece Proper, that very day (at Platea), is also a case in point. In countries more favorable for speedy travelling, much use was made of horses and other animals. The admirable system of roads and posts instituted by the kings of Persia throughout their vast dominions—"the posts that rode upon mules and camels," as we have it in the Book of Esther, excited the wonder of Herodotus, who says emphatically that "there is nothing in the world swifter than these messengers!" At the present time, an Arab will not unfrequently travel a hundred miles in a day on one of their untiring horses.

The Romans with their straight roads, the primary object of which (as of Russian railways) was speed for military purposes, provided, we may be sure, the means for making the utmost of them. In the times of the empire, post-houses were set up along the great highways every five or six miles, with about forty horses at each; so that a Roman ambassador, for instance, using these relays, might easily journey in his chariot a hundred miles a day.

Occasionally, ships were sent as express messengers; the *Salaminian* and the *Puralus* were used for this service at Athens. We do not know what rate of speed was reckoned upon. Herodotus calculates that a vessel would accomplish from six to seven miles an hour by daylight; but as he also assumes a certain amount of progress by night, he is probably speaking of a merchantman; for the crews of triremes often stopped at night and went ashore. The famous chase, mentioned by Thucydides, after the trireme conveying orders for the destruction of the Mytileneans, was noticed as an exception, the crew of the pursuing vessel sleeping by turns. As the first trireme had twenty-four hours' start for the distance between Athens and Lesbos, we can hardly put the pace of the other as less than ten miles an hour; so that the speed of a well-equipped Athenian trireme may have approached that of a modern steamship.

Love and War.

He crossed the mountain-paths alone,
Quick-radiant as the tender morn;
He wooed me by the altar-stone,
Where all our vows were sworn.
I heard the lark sing round his nest;
I heard, from love's divine eclipse—
His breast was burning on my breast,
His lips upon my lips.
Full sweet and glorious were his words,
Like bells that ring with marriage glee:
But War leaped out of hell, and stole
My lord from me.

Wild clarions shook the commonweal;
The legions of the land arose;
They swept like glancing streams of steel,
To smite the nation's foes.
I saw the hosts at early morn
Wind westward in their bearded might;

I heard the giggling bugle-horn
Laugh at the drum's delight:
I held the stirrup for his foot,
The best in that bright company;
One word—one kiss—and then he flashed
Like light from me.

Came one at length with trembling pace,
And fearful speech, and wandering eye;
A thousand deaths were in his face,
And one poor victory.
Another and another came,
With mangled limb and bleeding breast,
Who blew new-kindled fires of fame
Of heroes gone to rest:
Then came the laurelled legions home,
To lovers waiting wistfully:
But oh, dear Lord, he never came
To me—poor me!

I know not if I waked or slept
That weary, weary, woful night;
I only know I never wept—
My eyes were dry as light:
Yet in a trance I seemed to thread
The horrors of the battle-plain;
I found my hero cold and dead
Above the conquered slain:
And then he seemed to be alive;
I clasped him—oh, how tenderly!
'Twas but his ghost that soothed my arms:
God pity me!

—[Hugh Miller.

Hugh Miller takes rank with the most notable men of this generation, and among the self-taught men of Scotland he holds the highest place after Burns. His career, indeed, reads a rebuke to those pampered darlings of scholasticism who are born to feed on the dainties of culture, and who, although begirt from boyhood with all the appliances of scholarship, extract from a life of lettered ease only a few trifles of criticism or verse. Born in poverty, he received no direct instruction save that which could be dispensed by the overworked parish school-master of Cromarty. He was one of the millions who have owed the rudiments of their culture to John Knox and the other wise ecclesiastical statesmen who, when rearing the Protestantism of Scotland, acted on the principle that, to make the edifice stand for ages, they must plant it on no quicksand of tradition or of sentimental faith, but on the rock of educated reason. Miller might have profited by one or other of those Scottish universities which owe much of their lusty life to the foresight of the same men; but he was at first so wild, idle, and reckless, that he cast away the boon of academic culture. Although fond of reading and quick of mind, he hated the dry routine of school-tasks, detested the teacher, and coveted distinction merely as the leader of his playmates in the forays which they made upon orchards, the expeditions in which they played truant, and the long rambles in which they exchanged the dullness and monotony of the class-room for the wild freedom of the rocks that hem in the sea at Cromarty, or the shell-covered beach that afterward pictured to Miller himself the peopled expanse of geological time. Miller chose to be not a scholar, but a stone-mason; and he became one of the best in the north of Scotland. The man did well whatever he did at all. While living in Highland bothies, amid circumstances of savage wildness, and with companions who cared as little for books as if they had been so many Hottentots, Miller dreamed of a time when he should win fame as a man of letters. Despite the smoke, the darkness, the thousand discomforts of a wind-swept hut; despite the rain that trickled through the roof; despite

the laughter and the idiotic oaths that closed up the crevices in the talk of his fellow-workmen—the young student read Milton and Bacon, filled long epistles with rounded sentences, penned stiffly-classic verses, studied mathematics, and imprinted the features of Nature on a memory which could retain its hue and form as firmly as a red-sandstone slab keeps the impress of Old-World leaf or fish. By the time that he had graduated as a stone-mason, and could assume the M. A. of a journeyman, he had read so much of real literature, thought so vigorously, enriched his mind with so fine a culture, and acquired such a mastery over the English language, that he might have been saluted as an equal by men of regular scholastic training. He did not, indeed, know Greek or Latin, and he was ignorant of many things that form the mere commonplaces of the academic schools; but much of the culture that is communicated by the literature of Greece and Rome had come to him from contact with the classics of England; and, for what knowledge he lacked in certain domains of book-learning, he made up by the thoroughness with which he had surveyed less-beaten tracts, and by the strength of mental fibre which he had drawn from the athletics of lonely thought. Of him, as surely as of "the good Lord Clifford," might the poet have said:

"Love had he found in huts where poor men lie,
His daily teachers had been woods and hills,
The silence that is in the starry sky,
The sleep that is among the lonely hills."

Darwinism.

"We will now pass on," remarked the rural showman, "to behold the wisdom of Providence as displayed in the ring-tailed monkey." Mr. Darwin entreats our attention to the same inspiring theme. He does not, to be sure, deduce the wisdom of Providence from him. But he gives us in place of the fervor of religion the warmer personal interest of consanguinity in the subject of his researches. It may be humiliating to our vanity to be assured that the rubricated baboon which disports itself in its gilded bower in the menagerie is not only a kinsman, but the lineal and accurate representative of an older branch of the family, who is entitled to regard us with the same disgust which we commonly feel for him, by reason of our having lost those peculiarities of fingers and of tail which are unquestionably hereditary traits with him. But, as Mr. Darwin remarks, perhaps with a covert sarcasm upon the first chapter of Genesis, it is more creditable to be descended from an organic monkey than from a handful of inorganic dust. The misfortune of his position is that, as he does not attempt to account for the monkey or any other original form of life, we are driven back to the ultimate, and what Mr. Darwin considers the less flattering, hypothesis of the "inorganic dust," and obliged to submit to the additional humiliation of a pedigree derived through the graceful polyp and the patient oyster, if not through the humble turnip and the plebeian squash. It has always been considered ample evidence of relationship upon the stage to disclose a strawberry-mark upon the left arm. Certainly the existence of an aborted tail is as affecting and as conclusive a token.

Joking.

Some good people probably believe that all joking is evil, not because it gives them a sense of the danger in which they stand of a wound to their own self-importance, but because it engenders a light and trivial turn of mind in the joker, and either predisposes him against serious subjects, or, worse still, disposes him to

see an ephemeral and ludicrous side even to serious subjects. There is no joking, they say, in the Bible; and a man who keeps all his reserve of force for the subjects treated in the Bible will not often be in a joking humor. That very much depends, we should say, on the sort of person you are speaking of. Undoubtedly the old Jewish literature had very little humor in it. Few Oriental literatures ever have had. There is a certain grim sarcasm and irony in many of the Jewish prophets, but not a trace of humor. The truth is, that humor is the characteristic only of people who habitually keep their hold on conflicting and widely-divergent moods of feeling at the same time; not of people who are incapable of experiencing more than one mood of feeling at the same moment. No doubt the former kind of people—the one-mood-at-a-time people—are in some sense likely to be the most earnest. "Play" of feeling implies, of course, a partial loss of intensity. Opposite moods of mind cannot touch each other, cannot be intersecting moods without a certain dissipation of force. When Sydney Smith, while under the very nose of the omnibus-horse which had knocked him down, found his mind glancing off from the thought of eternity to the probable thought of hundreds of aspiring clergymen on hearing of his demise, namely, "there is a vacancy," it is obvious that he was not concentrating his thoughts on the spiritual condition of his own soul or on the prospect before him, as a pattern saint or penitent would have done. You cannot both divide your mind between two moods and concentrate it on one.

Indolence of Napoleon III.

Nobody, perhaps, in possession of great power was ever studied with more painful attention than the Emperor Napoleon, and certainly nobody ever was described with less of respectful reticence. He was known by thousands as a private individual, he was surrounded as emperor by enemies and spies, he lived in critical, censorious, gossipy Paris, it has been the interest of his successors to publish unpleasant scandals about him; yet we doubt if a hundred Englishmen are aware of his grand defect as an administrator, ever think of him as a saunterer, a victim to an excessive, almost abnormal, indolence. The daily, hourly work, hard, disagreeable work, work about details, work compelling him to scold, and censure, and hurt a hundred men a day, which Frederick the Great delighted in, and which would have saved France, was almost impossible to him. He would have died of the distasteful toil, would, we believe, scarcely have attempted it even had he known the ruin his favorites were working by their neglect, indolence being, in natures like his, a passion as strong as opium-eating. This defect, though perfectly well known to his intimates, was entirely unknown to the majority of men, yet it may well have been the one which ultimately proved fatal.

The American Girl.

Those who are made uneasy by the *Saturday Review's* bitter articles on British womanhood, fearing they indicate the demoralization of a race, should not fail to read the same journal's attempt to portray an American girl. In a recent number an article on winter-traveling has a paragraph devoted to this subject. According to this critic, the American girl devotes most of her time to eating and to talking about eating. "She is great on *tables d'hôte* and critical on hotels." She fills her pocket-book with recipes for the dishes she has met with, mixed with descriptions of Rome and lists of dancing-partners. She delights to tell

of the wealth of her "pa" and the vulgarity of her "ma." This is given as a specimen of her remarks: "I'm a Yankee gal, I guess, and ma keeps pretty slick out of my way." She is unequalled in a certain kind of "noisy flirting." She will laugh with, chat with, a man whom she has never seen before and never cares to see again, tell her secrets, swear a constant fidelity, and give a lock of her hair; and then she forgets sentiment in the sherry-cobbler. If she happens to be married, she says plumply: "Oh, yes, I love my husband, and a good many other people besides." Altogether, in the opinion of the *Saturday Review*, "an American girl ranks among the number of those agreeable acquaintances without whom life would be gray and colorless, and whom there is no need to introduce to one's wife."

Now, it is not necessary to deny that this brilliant observer may have drawn his portrait from the life, but there is at least not that striking fidelity to the reality, as we are accustomed to meet it in American society, to lead us to accept implicitly the comments appearing in the same quarter on the salient phases of English life of the period.

About Iron.

The shores of the Black Sea, Laconia, Spain, Africa, and Damascus, are among the most ancient sources of iron produce of which we have any authentic record. From Laconia the Greeks obtained, through the Phœnician merchants, their first supplies of this material, and the African shores yielded to the Romans argosies of iron-ore at a period of remote antiquity.

On the invasion of Britain by Cæsar (B. C. 55) the Roman legions were astonished to find our savage ancestors armed with swords, spears, and chariots of war, but there is no evidence to show that these were of native manufacture. The probability is that they had been brought by the Phœnicians from Southern Europe in exchange for the produce of the Cornish mines. It is, however, almost certain that the Roman occupation of Britain was immediately followed by the establishment of iron-works in various parts of the island. Evidences of this have been abundantly furnished by archaeological research. Not only have immense beds of cinders been discovered containing Roman coins and pottery, but ruins of altars to Jupiter Dolichenus have further attested this generally-accepted fact. The process of smelting employed by the Romans in Britain was a slight modification of that described by Homer. On an open hearth layers of charcoal and iron-stone were placed alternately, and, fire being applied, it was urged by men treading upon huge bellows. This was called the "foot-blast," and it prevailed in all the iron-making districts for several hundred years.

All the old chroniclers agree that, down to the time of Queen Elizabeth, the processes of iron-making had undergone little or no improvement since the days of Cæsar. To the reign of the virgin queen may be assigned the invention of the blast-furnace, one of the most important steps of progress in the entire history of the trade.

Mourning-Dress.

When or whence did it arise that, when one dies and goes to heaven, all the family should shroud themselves in deepest black, and the women be the especial victims? Somewhere the custom must have arisen, since the days of our ancestors—the Saxons, or the Piets and Scots, whose only clothing was painted on! Is it going further, or will there be some resist-

ance and a return to the right way? Some women spend half their lives under crape, a sort of self-imposed penance, hot, heavy, unwholesome. Men may wear a badge of mourning for a time, and then resume light clothes and yellow gloves. And very few dare to brave Mrs. Grundy, and follow out their convictions by refusing to yield to this absurd demand of custom. We think it is growing worse and worse. A family will wear crape three years, and black dresses three years more, for a mother who went straight to heaven, and who would say to them, "Mourn not for me." And so strong is the force of example that some one else must do the same, or it shows a "want of feeling." Now, it is no small thing to take away so much that is bright and cheerful in one's surroundings for so many years of life, and submit to a dress hot, heavy, and inconvenient. There is but one life to live. Why spoil that! The whole is a foolish, wasteful, and wicked expense.

Bores.

What constitutes a bore? What combination of qualities goes to make up that scourge of civilization? A total lack of humor, we should say, and of that sympathetic power which enables a person to see, as if by instinct, whether he or his conversation be agreeable to the listener, joined sometimes to intense egotism, though this last is not a necessary ingredient in the bore's character, except in so far as it is connected with want of sympathy. The essence of the bore is the absence of the sympathetic power. This by no means implies the absence of sympathizing power. The two are quite distinct. A person may bore one to death with sympathy, by offering it at the wrong time. A bore has no tact. This is why the masculine bore so largely predominates over the feminine. Women, as a rule, have more tact than men. They are more sympathetic, too, their finer sensibilities enabling them to feel the pulse, as it were, of the individual with whom they are conversing or the society in which they are mixing. But, though the feminine type is rarer than the masculine, it is infinitely the worse of the two. The rarity is more than compensated for by the intensity.

The Books of 1870.

The *Publishers' Circular* has recorded the publication in Great Britain in 1870 of 3,377 new books, 1,279 new editions of books originally published prior to 1870, and 426 imported new American works. The *Circular* has arranged the whole 5,082 in fourteen classes: 811 were theological works; 568, educational; 695, juvenile; 381, novels; 128 books relating to law; 119 relating to politics and trade; 246, to art and science; 338, to travel; 396, history and biography; 366, poetry and the drama; 338, year books and bound volumes of serials; 193 relating to medicine and surgery; 249, *belles-lettres*, essays monographs, etc.; 159 miscellaneous, including pamphlets other than sermons. The last three months of the year saw the largest number of new publications: October, 488; November, 549; December, 610.

Intelligence of Animals.

Charles George Leroy, a French naturalist, who nearly a century ago was ranger of the parks of Versailles and Marly, published "Essays on the Intelligence of Animals," in which he maintained that their mental faculties are like those of man; that they remember, combine, and reflect; that they are capable of self-improvement; and even that they possess a true language fully adapted to their needs. Mr. Darwin seems to entertain nearly similar views.

Varieties.

DURING the recent war, a contraband came into the Federal lines in North Carolina, and was marched up to the officer of the day to give an account of himself, whereupon the following colloquy ensued: "What is your name?" "My name is Sam." "Sam what?" "No, sah; not Sam Watt. I'se jist Sam." "What's your other name?" "I hasn't no oder name, sah. I'se Sam—dat's all." "What's your master's name?" "I'se got no master now; massa runned away—yah! yah! I'se free nigger now." "What's your father and mother's name?" "I'se got none, sah—neber had none. I'se jist Sam—ain't nobody else." "Haven't you no brothers and sisters?" "No, sah, neber had none. No brudder, no sister, no fader, no moder, no massa—nothin' but Sam. When you see Sam, you see all there is of us."

Although it was once customary to call every high peak of the Rocky Mountains eighteen thousand feet in altitude, but one shows fifteen thousand feet on actual measurement. There are many of fourteen thousand feet. It is somewhat remarkable how regularly this height is preserved. So far as measured, there are twenty peaks above thirteen thousand, and ten about fourteen thousand feet above the sea-level.

A "SELL."—We've all got our little weaknesses. Brown's little weakness is this: When he and Mrs. Brown go to a dinner-party, they do it in style; and he naturally likes his entertainer's flunkies to think that the equipage he has hired for the occasion is his own. Brown (in a loud voice): "O—a—come for us at eleven, John." The coachman (in a louder): "Hall right, sir! What name shall I hask for?"

A man in Covington, Ky., made a bet the other day that he could drink a pint and a half of Cincinnati whiskey in twelve hours. He won the bet, says the *Louisville Courier-Journal*, and his widow remarked at the funeral the next day, that it was the first money he had earned by hard work in ten years.

The story comes from Paris of a lady who was so overcome by her appetite during the siege as to eat her darling lap-dog. After a hearty meal, she looked down at the little heap of bones; tears fell from her eyes. "Poor Bijou," she exclaimed, "how he would have enjoyed them!"

The London *Cosmopolitan* proposes the following marriage-vow for its lady readers, when occasion requires: "I will continue to love my husband so long as he is lovable, honor him so long as he remains honorable, and obey him so long as his commands are just and reasonable."

Servants receive the highest prices in the world in St. Petersburg. Girls that can cook get forty dollars per month, and all in that proportion. After St. Petersburg, Roumania and London pay servants best, and then the United States.

Gail Hamilton's declaration that "pecuniary dependence, degrading to men, is not only not undignified, but is the only thoroughly dignified condition for women," is quoted all over the country as sound and sensible.

The Philadelphia *Press* is advocating a "domestic option" bill, under the provisions of which no man should be allowed to buy a glass of ale, or wine, or whiskey, without presenting at the bar a written permit from his wife.

A Maine man, going into the wilderness, took what he supposed to be his compass, but found, when he needed its guidance, he had instead taken his wife's daguerreotype. It brought him out all right.

Mrs. Clara Nash has been admitted to practice at the bar at Columbia, N. H., and has been appointed justice of the peace. Letters to her are addressed "Clara Nash, Esq., Columbia, N. H."

Daniel Drew, being on one of his own steamers, was accosted by a passenger, who took him for one of the crew, with, "Do you belong to this boat?" "No," said Daniel, quietly, "the boat belongs to me."

The recent report of the United States Surveying Corps gives the extreme length of the great lakes as follows: Superior, 325 miles; Michigan, 390; Huron, 200; Erie, 250; Ontario, 180.

The United States consumes five times as much coffee per capita as England, and twice as much as France. England consumes about one half of all the sugar that is made in the world.

The *Saturday Review* thinks that the chief intellectual lights of America, during the eighteenth century, were undoubtedly Benjamin Franklin and Jonathan Edwards.

Major Zagonyi, who led the famous charge of Fremont's body-guard at Springfield, Mo., the first year of the war, is said to be keeping a cigar-shop in Pesth, Hungary.

The first Protestant service in Madrid was attended by not more than fifteen persons. There are now two congregations that number one thousand each.

Dr. Hammond says, spiritualism is a disease which can be cured by iron and strychnine. The latter, we should think, would be sufficient.

The inquiry as to where all the pins go to, has been satisfactorily answered. The theory now is, that they go into the ground and become terra-pins.

About one thousand persons have lost their lives in connection with the Mont-Cenis Tunnel since it was first begun in 1859.

Grant isn't much of a smoker after all, in comparison with Von Beust, the Austrian minister, whose minimum is forty cigars a day.

There are three things," said a wit, "which I have loved without understanding them: paintings, music, and women."

A sailor's life is made unnecessarily perilous at Noank, where they send vessels to sea with Noankers on board.

Why will next year be like the last? Because last year was 1870, and next year will be 1872.

It is not necessary that an actor should be a great painter, but he can look for no success unless he draws well.

Is it proof of an economical disposition, if a young lady indulges in tight lacing to prevent waist-fullness?

A negro, after gazing at some Chinese, exclaimed: "If de white folks is so dark out dere, I wonder what's de color ob de niggers?"

A doctor's motto is supposed to be "patients and long suffering."

Cotton was first planted in the United States in 1759.

The royal "carpet-bagger" is what they call the new King of Spain.

Philadelphia contains over four hundred churches.

One-fourth of the globe is said to be granite.

Doing a roaring business—Keeping a wild-beast show.

The smallest internal-revenue-paying State is Arkansas.

How to raise beets—Take hold of the tops, and pull.

Some fat men do not seek greatness; it is thrust upon them.

There are about two hundred postmistresses in the United States.

The Canadian Dominion has forty-three daily newspapers.

Celestial Empire, the particular weapon, from which our drawings are taken, having been captured by the British in their last war with China.

It is not at all easy to describe the working of this curious bow, but, with the aid of the illustration, we will try to make it intelligible.

The bow itself is made of three strong, separate pieces of bamboo, overlapping each other like the plates of a carriage-spring, which indeed it exactly resembles. This is mounted on a stock, and, as the bow is intended for wall defence, it is supported in the middle by a pivot. So far, we have a simple crossbow; we have now to see how the repeating machinery is constructed. Upon the upper surface of the stock lies an oblong box, which we will call the "slide." It is just wide and long enough to contain the arrows, and is open above, so as to allow them to be dropped into it. When in the slide, the arrows necessarily lie one above the other, and, in order to prevent them from being jerked out of the slide by the shock of the bowstring, the opening can be closed by a little wooden shutter which slides over it.

Through the lower part of the slide a transverse slit is cut, and the bowstring is led through this cut, so that the string presses the slide upon the stock. Now we come to the lever. It is shaped like the Greek letter Π , the cross-piece forming the handle. The lever is jointed to the stock by an iron pin or bolt, and to the slide by another bolt. Now, if the lever be worked to and fro, the slide is pushed backward and forward along the stock, but without any other result.

Supposing that we wish to make the lever draw the bow, we have only to cut a notch in the under part of the slit through which the string is led. As the slide passes along the stock, the string by its own pressure falls into the notch, and is drawn back, together with the slide, thus bending the bow. Still, however much we may work the lever, the string will remain in the notch, and must therefore be thrown out by a kind of trigger. This is self-acting, and is equally simple and ingenious. Immediately under the notch which holds the string, a wooden peg plays loosely through a hole. When the slide is thrust forward and the string falls into the notch, it pushes the peg out of the hole. But when the lever and slide are drawn backward to their full extent, the lower end of the peg strikes against the stock, so that it is forced violently through the hole, and pushes the string out of the notch.

We will now refer to the illustration. Fig. 1 represents the bow as it appears after the lever and slide have been thrust forward, and the string has fallen into the notch. Fig. 2 represents it as it appears when the lever has been brought back, and the string released.

A is the bow, made of three layers of male bamboo, the two outer being the longest. B is the string. This is made of very thick catgut, as is needed to withstand the amount of friction which it has to undergo, and the violent shock of the bow. It is fastened in a wonderfully ingenious manner, by a "hitch" rather than a knot, so that it is drawn tighter in proportion to the tension. It passes round the end of the bow, through a hole, and then presses upon itself.

C C show the stock, and D is the slide. E is the opening of the slide, through which the arrows are introduced into it, and it is shown as partially closed by the little shutter F. The lever is seen at G, together with the two pins which connect it with the stock and the slide. H shows the notch in the slide which

The Museum.

OUR illustration this week represent a curious Chinese weapon, a repeating cross-bow, of a kind still used by the soldiery of the

receives the string. I is the pivot on which the weapon rests, K is the handle, and L the place whence the arrows issue. If the reader should have followed this description carefully, he will see that the only limit to the rapidity of fire is the quickness with which the lever can be worked to and fro. As it is thrust forward, the string drops into its notch, the trigger-peg is set, and an arrow falls with its butt just in front of the string. When it is drawn sharply back, the string is released by the trigger-peg, the arrow is propelled, and another falls into its place. If, therefore, a boy be kept at work supplying the slide with arrows, a constant stream of missiles can be poured from this weapon.

The arrows are very much like the "bolts" of

the old English crossbow. They are armed with heavy and solid steel heads, and are feathered in a very ingenious manner. The feathers are

so slight, that at first sight they appear as if they were mere black scratches on the shaft. They are, however, feathers, projecting barely the fiftieth of an inch from the shaft, but arranged in a slightly-spiral form, so as to catch the air, and impart a rotatory motion to the arrow. By the side of the cross-bow on Fig. 2 is seen a bundle of the arrows. The strength of this bow is very great. It possesses but little powers of aim, and against a single and moving adversary would be useless. But for the purpose for which it is designed, namely, a wall-piece which will pour a series of missiles upon a body of men, it is a very efficient weapon, and can make itself felt even against the modern rifle. Its range is said to be four hundred yards.

RALPH THE HEIR.

By ANTHONY TROLLOPE.

["RALPH THE HEIR," SUPPLEMENT No. XXI.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF APRIL 15.]

CHAPTER LI.

MUSIC HAS CHARMS.

THE commission appointed to examine into the condition of the borough of Percycross cannot exactly be said to have made short work of it, for it sat daily for many consecutive weeks, and examined half the voters in the town; but it made sharp work, and reported to the Speaker of the House such a tale of continual corruption, that all the world knew that the borough would be disfranchised. The glory of Percycross was gone, and in regard to political influence it was to be treated as the cities of the plain, and blotted from off the face of existence. The learned gentlemen who formed the commission had traced home to Mr. Griffenbottom's breeches-pockets large sums of money which had been expended in the borough for purposes of systematized corruption during the whole term of his connection with it—and yet they were not very hard upon Mr. Griffenbottom personally in their report. He had spent the money, no doubt, but had so spent it that at every election it appeared that he had not expected to spend it till the bills were sent to him. He frankly owned that the borough had been ruinous to him; had made a poor man of him—but assured the commission at the same time that all this had come from his continued innocence. As every new election came round, he had hoped that that would at least be pure, and had been urgent in his instructions to his agents to that effect. He had at last learned, he said, that he was not a sufficient Hercules to cleanse so foul a stable. All this created no animosity against him in Percycross during the sitting of the commission. His old friends, the Triggers, and Piles, and Spivey-combs, clung to him as closely as ever. Every man in Percycross knew that the borough was gone, and there really seemed at last to be something of actual gratitude in their farewell behavior to the man who had treated the place as it liked to be treated. As the end of it all, the borough was undoubtedly to be disfranchised, and Mr. Griffenbottom left it—a ruined man, indeed, according to his own statement—but still with his colors flying, and, to a certain extent, triumphantly. So we will leave him, trusting—or perhaps rather hoping—that the days of Mr. Griffenbottom are nearly at an end.

His colleague, Sir Thomas, on the occa-

sion of his third visit to Percycross—a visit which he was constrained to make, sorely against his will, in order that he might give his evidence before the commission—remained there but a very short time. But while there he made a clean breast of it. He had gone down to the borough with the most steadfast purpose to avoid corruption; and had done his best in that direction. But he had failed. There had been corruption, for which he had himself paid in part. There had been treating of the grossest kind. Money had been demanded from him since the election, as to the actual destination of which he was profoundly ignorant. He did not, however, doubt but that this money had been spent in the purchase of votes. Sir Thomas was supposed to have betrayed the borough in his evidence, and was hooted out of the town. On this occasion he only remained there one night, and left Percycross forever, after giving his evidence.

This happened during the second week in May. On his return to London he did not go down to Fulham, but remained at his chambers in a most unhappy frame of mind. This renewed attempt of his to enter the world and to go among men that he might do a man's work, had resulted in the loss of a great many hundred pounds, in absolute failure, and, as he wrongly told himself, in personal disgrace. He was almost ashamed to show himself at his club, and did for two days absolutely have his dinner brought to him in his chambers from an eating-house.

"I'm sure you won't like that, Sir Thomas," Stemm had said to him, expostulating, and knowing very well the nature of his master's sufferings.

"I don't know that I like any thing very much," said Sir Thomas.

"I wouldn't go and not show my face because of other people's roguery," rejoined Stemm, with cruel audacity. Sir Thomas looked at him, but did not answer a word, and Stemm fetched the food.

"Stemm," said Sir Thomas the same evening, "it's getting to be fine weather now."

"It's fine enough," said Stemm.

"Do you take your nieces down to South-end for an outing. Go down on Thursday and come back on Saturday. I shall be at home. There's a five-pound note for the expenses."

Stemm slowly took the note, but grunted and grumbled. The girls were nuisances to him, and he didn't want to take them an out-

ing. They wouldn't care to go before July, and he didn't care to go at all.

"You can go when you please," said Sir Thomas. Stemm growled and grumbled, and at last left the room with the money.

The morning afterward Sir Thomas was sitting alone in his room absolutely wretched. He had so managed his life that there seemed to be nothing left to him in it worth the having. He had raised himself to public repute by his intellect and industry, and had then, almost at once, allowed himself to be hustled out of the throng simply because others had been rougher than he—because other men had pushed and shouldered while he had been quiet and unpretending. Then he had resolved to make up for this disappointment by work of another kind—by work which would, after all, be more congenial to him. He would go back to the dream of his youth, to the labors of former days, and would in truth write his *Life of Bacon*. He had then surrounded himself with his papers, had gotten his books together and read up his old notes, had planned chapters and sections, and settled divisions, had drawn up headings, and revelled in those paraphernalia of work which are so dear to would-be working-men—and then nothing had come of it. Of what use was it that he went about ever with a volume in his pocket, and read a page or two as he sat over his wine? When sitting alone in his room he did read; but when reading he knew that he was not working. He went, as it were, round and round the thing, never touching it, till the labor which he longed to commence became so frightful to him that he did not dare to touch it. To do that thing was the settled purpose of his life, and yet, from day to day and from month to month, it became more impossible to him even to make a beginning. There is a misery in this which only they who have endured it can understand. There are idle men who rejoice in idleness. Their name is legion. Idleness, even when it is ruinous, is delightful to them. They revel in it, look forward to it, and almost take a pride in it. When it can be had without pecuniary detriment, it is to such men a thing absolutely good in itself. But such a one was not Sir Thomas Underwood. And there are men who love work, who revel in that, who attack it daily with renewed energy, almost wallowing in it, greedy of work, who go to it almost as the drunkard goes to his bottle, or the gambler to his gaming-table. These are not unhappy men,

though they are perhaps apt to make those around them unhappy. But such a one was not Sir Thomas Underwood. And again there are men, fewer in number, who will work though they hate it, from sheer conscience and from conviction that idleness will not suit them or make them happy. Strong men these are—but such a one certainly was not Sir Thomas Underwood. Then there are they who love the idea of work, but want the fibre needful for the doing it. It may be that such a one will earn his bread as Sir Thomas Underwood had earned his, not flinching from routine task, or even from the healthy efforts necessary for subsistence. But there will ever be present to the mind of the ambitious man the idea of something to be done over and above the mere earning of his bread—and the ambition may be very strong, though the fibre be lacking. Such a one will endure an agony protracted for years, always intending, never performing, self-accusing through every wakeful hour, self-accusing almost through every sleeping hour. The work to be done is close there by the hand, but the tools are loathed, and the paraphernalia of it become hateful. And yet it can never be put aside. It is to be grasped to-morrow, but on every morrow the grasping of it becomes more difficult, more impossible, more revolting. There is no peace, no happiness for such a man—and such a one was Sir Thomas Underwood.

In this strait he had been tempted to make another effort in political life, and he had made it. There had been no difficulty in this—only that the work itself had been so disagreeable, and that he had failed in it so egregiously. During his canvass, and in all his intercourse with the Griffenbottomites, he had told himself, falsely, how pleasant to him it would be to return to his books—how much better for him would be a sedentary life, if he could only bring himself to do, or even attempt to do, the work which he had appointed for himself. Now he had returned to his solitude, had again dragged out his papers, his note-book, his memoranda, his dates, and yet he could not in truth get into his harness, put his neck to the collar, and attempt to drag the burden up the hill.

He was sitting alone in his room in this condition, with a book in his hand of no value to his great purpose, hating himself and wretched, when Stemm opened his door, ushering Patience and Mary Bonner into his room. "Ah, my dears," he said, "what has brought you up to London? I did not think of seeing you here." There was no expression of positive displeasure in his voice, but it was understood by them all, by the daughter, by the cousin, by old Stemm, and by Sir Thomas himself, that such a visit as this was always to be regarded more or less as an intrusion. However, he kissed them both, and handed them chairs, and was more than usually civil to them.

"We do so want to hear about Percycross, papa," said Patience.

"There is nothing to be told about Percycross."

"Are you to stand again, papa?"

"Nobody will ever stand for Percycross again. It will lose its members altogether. The thing is settled."

"And you have had all the trouble for nothing, uncle?" Mary asked.

"All for nothing—and the expense. But that is a very common thing, and I have no ground of complaint beyond many others."

"It does seem so hard," said Patience.

"So very hard," said Mary. And then they were silent. They had not come without a purpose; but, as is common with young ladies, they kept their purpose for the end of the interview.

"Are you coming home, papa?" Patience asked.

"Well, yes; I won't settle any day now, because I am very busy just at present. But I shall be home soon—very soon."

"I do so hope you'll stay some time with us, papa."

"My dear, you know—" And then he stopped, having been pounced upon so suddenly that he had not resolved what excuse he would for the moment put forward. "I've got my papers and things in such confusion here at present—because of Percycross and the trouble I have had—that I cannot leave them just now."

"But why not bring the papers with you, papa?"

"My dear, you know I can't."

Then there was another pause. "Papa, I think you ought," said Patience. "Indeed I do, for Clary's sake—and ours." But even this was not the subject which had specially brought them on that morning to Southampton Buildings.

"What is there wrong with Clary?" asked Sir Thomas.

"There is nothing wrong," said Patience.

"What do you mean, then?"

"I think it would be so much more comfortable for her that you should see things as they are going on."

"I declare I don't know what she means. Do you know what she means, Mary?"

"Clary has not been quite herself lately," said Mary.

"I suppose it's something about that scamp, Ralph Newton," said Sir Thomas.

"No, indeed, papa; I am sure she does not think of him now." On this very morning, as the reader may perhaps remember, the scamp had gone down to Fulham, and from Fulham back to Brompton, in search of Clarissa; but of the scamp's energy and renewed affections, Patience as yet knew nothing. "Gregory has been up in London and has been down at Fulham once or twice. We want him to come again before he goes back on Saturday, and we thought if you would come home on Thursday, we could ask him to dinner." Sir Thomas scratched his head, and fidgeted in his chair. "Their cousin is in London also," continued Patience.

"The other Ralph; he who has bought Beamingham Hall?"

"Yes, papa; we saw him at the Acade-

my. I told him how happy you would be to see him at Fulham."

"Of course I should be glad to see him; that is, if I happened to be at home," said Sir Thomas.

"But I could not name a day without asking you, papa."

"He will have gone back by this time," said Sir Thomas.

"I think not, papa."

"And what do you say, Mary?"

"I have nothing to say at all, uncle. If Mr. Newton likes to come to the villa, I shall be glad to see him. Why should I not? He has done nothing to offend me." There was a slight smile on her face as she spoke, and the merest hint of a blush on her cheek.

"They tell me that Beamingham Hall isn't much of a place after all," said Sir Thomas.

"From what Mr. Newton says, it must be a very ugly place," said Mary, with still the same smile and the same hint of a blush—"only I don't quite credit all he tells us."

"If there is any thing settled you ought to tell me," said Sir Thomas.

"There is nothing settled, uncle, or in any way of being settled. It so happened that Mr. Newton did speak to me about his new house. There is nothing more."

"Nevertheless, papa, pray let us ask him to dinner on Thursday." It was for the purpose of making this request that Patience had come to Southampton Buildings, braving her father's displeasure. Sir Thomas scratched his head, and rubbed his face, and yielded. Of course he had no alternative but to yield, and yet he did it with a bad grace. Permission, however, was given, and it was understood that Patience would write to the two young men, Ralph of Beamingham Hall and the parson, asking them to dinner for the day but one following. "As the time is so short, I've written the notes already," said Patience, producing them from her pocket. Then the bell was rung, and the two notes were confided to Stemm. Patience, as she was going, found a moment in which to be alone with her father, and to speak one more word to him. "Dear papa, it would be so much better for us that you should come and live at home. Think of those two, with nobody, as it were, to say a word for them." Sir Thomas groaned, and again scratched his head; but Patience left him before he had arranged his words for an answer.

When they were gone, Sir Thomas sat for hours in his chair without moving, making the while one or two faint attempts at the book before him, but in truth giving up his mind to contemplation of the past and to conjectures as to the future, burdened by heavy regrets, and with hopes too weak to afford him any solace. The last words which Patience had spoken rang in his ears—"Think of those two, with nobody, as it were, to say a word for them." He did think of them, and of the speaker also, and knew that he had neglected his duty. He could understand that such a girl as his own Cla-

rissa did require some one "to say a word for her," some stalwart arm to hold her up, some loving strength to support her, some counsel to direct her. Of course those three girls were as other girls, looking forward to matrimony as their future lot in life, and it would not be well that they should be left to choose or be chosen, or left to reject and be rejected, without any aid from their remaining parent. He knew that he had been wrong, and he almost resolved that the chambers in Southampton Buildings should be altogether abandoned, and his books removed to Popham villa.

But such men do not quite resolve. Before he could lay his hand upon the table and assure himself that the thing should be done, the volume had been taken up again, used for a few minutes, and then the man's mind had run away again to that vague contemplation which is so much easier than the forming of a steady purpose. It was one of those almost sultry days which do come to us occasionally amid the ordinary inclemency of a London May, and he was sitting with his window open, though there was a fire in the grate. As he sat, dreaming rather than thinking, there came upon his ear the weak, wailing, puny sound of a distant, melancholy flute. He had heard it often before, and had been roused by it to evil wishes, and sometimes even to evil words, against the musician. It was the effort of some youth in the direction of Staple's Inn to soothe with music the savageness of his own bosom. It was borne usually on the evening air, but on this occasion the idle swain had taken up his instrument within an hour or two of his early dinner. His melody was burdened with no peculiar tune, but consisted of a few low, wailing, melancholy notes, such as may be extracted from the reed by a breath and a slow raising and falling of the little finger, much, we believe, to the comfort of the player, but to the ineffable disgust of, too often, a large circle of hearers.

Sir Thomas was affected by the sound long before he was aware that he was listening to it. To-whew, to-whew; to-whew, to-whew, to-whew; whew-to-to, whew-to-to, whew, to-whew. On the present occasion the variation was hardly carried beyond that; but so much was repeated with a persistency which at last seemed to burden the whole air round Southampton Buildings. The little thing might have been excluded by the closing of the window; but Sir Thomas, though he suffered, did not reflect for a while whence the suffering came. Who does not know how such sounds may serve to enhance the bitterness of remorse, to add a sorrow to the present thoughts, and to rob the future of its hopes?

There come upon us all as we grow up in years, hours in which it is impossible to keep down the conviction that every thing is vanity, that the life past has been vain from folly, and that the life to come must be vain from impotence. It is the presence of thoughts such as these that need the assurance of a heaven to save the thinker from madness or from suicide.

It is when the feeling of this pervading vanity is strongest on him, that he who doubts of heaven most regrets his incapacity for belief. If there be nothing better than this on to the grave—and nothing worse beyond the grave—why should I bear such fardels?

Sir Thomas, as he sat there listening and thinking, unable not to think and not to listen, found that the fardels were very heavy. What good had come to him of his life—to him or to others? And what further good did he dare to promise to himself? Had it not all been vanity? Was it not all vain to him now at the present? Was not life becoming to him vainer and still vainer every day? He had promised himself once that books should be the solace of his age, and he was beginning to hate his books, because he knew that he did no more than trifle with them. He had found himself driven to attempt to escape from them back into public life; but had failed, and had been inexpressibly dismayed in the failure. While failing, he had promised himself that he would rush at his work on his return to privacy and to quiet; but he was still as the shivering coward, who stands upon the brink, and cannot plunge in among the bathers. And then there was sadness beyond this, and even deeper than this. Why should he have dared to arrange for himself a life different from the life of the ordinary men and women who lived around him? Why had he not contented himself with having his children around him; walking with them to church on Sunday morning, taking them to the theatre on Monday evening, and allowing them to read him to sleep after tea on the Tuesday? He had not done these things, was not doing them now, because he had ventured to think himself capable of something that would justify him in leaving the common circle. He had left it, but was not justified. He had been in Parliament, had been in office, and had tried to write a book. But he was not a legislator, was not a statesman, and was not an author. He was simply a weak, vain, wretched man, who, through false conceit, had been induced to neglect almost every duty of life! To-whew, to-whew, to-whew, to-whew! As the sounds filled his ears, such were the thoughts which lay heavy on his bosom. So idle as he had been in thinking, so inconclusive, so frail, so subject to gusts of wind, so incapable of following his subject to the end, why had he dared to leave that Sunday-keeping, church-going, domestic, decent life, which would have become one of so ordinary a calibre as himself? There are men who may doubt, who may weigh the evidence, who may venture to believe or disbelieve in compliance with their own reasoning faculties—who may trust themselves to think it out; but he, too clearly, had not been, was not, and never would be, one of these. To walk as he saw other men walking around him—because he was one of the many; to believe that to be good which the teachers appointed for him declared to be good; to do prescribed duties without much personal inquiry into the causes which had made them duties; to listen patiently, and to

be content without excitement; that was the mode of living for which he should have known himself to be fit. But he had not known it, and had strayed away, and had ventured to think that he could think—and had been ambitious. And now he found himself stranded in the mud of personal condemnation—and that so late in life, that there remained to him no hope of escape. Whew-to-to; whew-to-to; whew—to-whew. "Stemm, why do you let that brute go on with his cursed flute?" Stemm at that moment opened the door to suggest that, as he usually dined at one, and, as it was now past three, he would go out and get a bit of something to eat.

"He's always at it, sir," said Stemm, pausing for a moment before he alluded to his own wants.

"Why the deuce is he always at it? Why isn't he indicted for a nuisance? Who's to do any thing with such a noise as that going on for hours together? He has nearly driven me mad."

"It's young Wobble as has the back attic, No. 17, in the Inn," said Stemm.

"They ought to turn him out," said Sir Thomas.

"I rather like it myself," said Stemm. "It suits my disposition, sir." Then he made his little suggestion in regard to his own personal needs, and of course was blown up for not having come in two hours ago to remind Sir Thomas that it was dinner-time. "It's because I wouldn't disturb you when you has the Bacon papers out, Sir Thomas," said Stemm, serenely. Sir Thomas winced and shook his head; but such scenes as this were too common to have much effect.

"Stemm!" he called aloud, as soon as the old clerk had closed the door; "Stemm!" Whereupon Stemm reappeared. "Stemm, have some one here next week to pack all these books."

"Pack all the books, Sir Thomas!"

"Yes—to pack all the books. There must be cases. Now, go and get your dinner."

"New cases, Sir Thomas?"

"That will do. Go and get your dinner." And yet his mind was not quite made up.

CHAPTER LII.

GUS EARDHAM.

WHETHER Mr. Neefit broke Ralph Newton's little statuette—a miniature copy in porcelain of the Apollo Bevidere, which stood in a corner of Ralph's room, and in the possession of which he took some pride—from awkwardness in his wrath or of malice prepense, was never known. He told the servant that he had whisked it down with his coat-tails; but Ralph always thought that the breeches-maker had intended to make a general ruin, but had been cowed by the noise of his first attack. He did, at any rate, abstain from breaking other things, and when the servant entered the room, condescended

to make some careless apology. "A trifle like that ain't nothing between me and your master, Jack," said Mr. Neeft, after accounting for the accident by his coat-tails.

"I am not Jack," said the indignant valet, with a strong foreign accent. "I am named—Adolphe."

"Adolphe, are you? I don't think much of Adolphe for a name—but it ain't no difference to me. Just pick up them bits; will you?"

The man turned a look of scorn on Mr. Neeft, and did pick up the bits. He intended to obey his master as far as might be possible, but was very unwilling to wait upon the breeches-maker. He felt that the order which had been given to him was very cruel. It was his duty—and his pleasure to wait upon gentlemen; but this man he knew to be a tradesman who measured customers for hunting apparel in his own shop. It was hard upon him that his master should go and leave him to be insulted, ordered about, and trodden upon, by a breeches-maker. "Get me a bit of steak, will you?" demanded Neeft—"a bit of the rump, not too much done, with the gravy in it—and an onion. What are you staring at? Didn't you hear what your master said to you?"

"Onion—and romp-steak!"

"Yes; rump-steak and onion. I ain't going out of this till I've had a bit of grub. Your master knows all about it. I'm going to have more nor that out of him before I've done with him."

Neeft did at last succeed, and had his rump-steak and onion, together with more brandy and soda-water, eating and drinking as he sat in Ralph's beautiful new easy-chair—not very much to his own comfort. A steak at the Prince's Feathers in Conduit Street would have been very much more pleasant to him, and he would have preferred half-and-half in the pewter to brandy and soda-water—but he felt a pride in using his power in a fashion that would be disgraceful to his host. When he had done his steak he pulled his pipe out of his pocket, and smoked. Against this Adolphe remonstrated stoutly, but quite in vain. "The captain won't mind a little baccy-smoke out of my pipe," he said. "He always has his smoke comfortable when he comes down to me." At last, about four o'clock, he did go away, assuring Adolphe that he would repeat his visit very soon. "I means to see a deal of the captain this season," he said. At last, however, he retreated, and Adolphe opened the door of the house for him without speaking a word. "By-by," said Neeft. "I'll be here again before long."

Ralph on that afternoon came home to dress for dinner at about seven, in great fear lest Neeft should still be found in his rooms. "No, saar; he got away at last!" said Adolphe with a melancholy shake of his head.

"Has he done much harm?"

"The Apollo gone—and he had romp-steak—and onions—and a pipe. Vat vas I to do? I hope he vill never come again." And

so also did Mr. Newton hope that Neeft would never come again.

He was going to dine with Lady Eardham, the wife of a Berkshire baronet, who had three fair daughters. At this period of his life he found the aristocracy of Berkshire and Hampshire to be very civil to him; and, indeed, the world at large was disposed to smile on him. But there was very much in his lot to make him unhappy. He had on that morning been utterly rejected by Clarissa Underwood. It may, perhaps, be true that he was not a man to break his heart because a girl rejected him. He was certainly one who could have sung the old song, "If she be not fair for me, what care I how fair she be?" And yet Clarissa's conduct had distressed him, and had caused him to go about throughout the whole afternoon with his heart almost in his boots. He had felt her coldness to him much more severely than he had that of Mary Bonner. He had taught himself to look upon that little episode with Mary as though it had really meant nothing. She had just crossed the sky of his heaven like a meteor, and for a moment had disturbed its serenity. And Polly also had been to him a false light, leading him astray for a while, under exceptional, and, as he thought, quite pardonable circumstances. But dear little Clary had been his own peculiar star—a star that was bound to have been true to him, even though he might have erred for a moment in his worship—a star with a sweet, soft, enduring light, that he had always assured himself he might call his own when he pleased. And now this soft, sweet star had turned upon him and scorched him. "When I get home," she had said to him, "I shall find that you have already made an offer to Patience!" He certainly had not expected such scorn from her. And then he was so sure in his heart that if she would have accepted him, he would have been henceforth so true to her, so good to her! He would have had such magnanimous pleasure in showering upon her pretty little head all the good things at his disposal, that, for her own sake, the pity was great. When he had been five minutes in his cab, bowling back toward his club, he was almost minded to return and give her one more chance. She would just have suited him. And as for her—would it not be a heaven on earth for her if she would only consent to forget that foolish, unmeaning little episode? Could Clary have forgotten the episode, and been content to care little or nothing for that easiness of feeling which made our Ralph what he was, she might, probably, have been happy as the mistress of the Priory. But she would not have forgotten, and would not have been content. She had made up her little heart stoutly that Ralph the heir should sit in it no longer, and it was well for him that he did not go back.

He went to his club instead—not daring to go to his rooms. The insanity of Neeft was becoming to him a terrible bane. It was, too, a cruelty which he certainly had done nothing to deserve. He could lay his

hand on his heart and assure himself that he had treated that mad, pig-headed tradesman well in all respects. He knew himself to be the last man to make a promise, and then to break it wilfully. He had certainly borrowed money of Neeft—and at the probable cost of all his future happiness he had, with a nobleness which he could not himself sufficiently admire, done his very best to keep the hard terms which in his distress he had allowed to be imposed upon himself. He had been loyal, even to the breeches-maker—and this was the return which was made to him!

What was he to do, should Neeft cling to his threat and remain permanently at his chambers? There were the police, and no doubt he could rid himself of his persecutor. But he understood well the barbarous power which some under-bred, well-trained barrister would have of asking him questions which it would be so very disagreeable for him to answer! He lacked the courage to send for the police. Jacky Joram had just distinguished himself greatly, and nearly exterminated a young gentleman who had married one girl while he was engaged to another. Jacky Joram might ask him questions as to his little dinners at Alexandra Lodge, which it would nearly kill him to answer. He was very unhappy, and began to think that it might be as well that he should travel for twelve months. Neeft could not persecute him up the Nile, or among the Rocky Mountains. And perhaps Clary's ferocity would have left her were he to return after twelve months of glorious journeyings, still constant to his first affections. In the mean time he did not dare to go home till it would be absolutely necessary that he should dress for dinner.

In the billiard-room of his club he found Lord Polperrow—the eldest son of the Marquis of Megavissey—pretty Poll, as he was called by many young men, and by some young ladies, about town. Lord Polperrow had become his fast friend since the day on which his heirship was established, and now encountered him with friendly intimacy.

"Halloa, Newton," said the young lord, "have you seen old Neeft lately?"

There were eight or ten men in the room, and suddenly there was silence among the cues.

Ralph would have given his best horse to be able to laugh it off, but he found that he could not laugh. He became very hot, and knew that he was red in the face.

"What about old Neeft?" he said.

"I've just come from Conduit Street, and he says that he has been dining with you. He swears that you are to marry his daughter."

"He be d—!" said Newton. It was a poor way of getting out of the scrape, and so Ralph felt.

"But what's the meaning of it all? He's telling everybody about London that you went down to stay with him at Margate."

BY THE AUTHOR OF "VALERIE ATLMER."

CHAPTER XV.—MERRY CHRISTMAS!

WEDNESDAY was Christmas eve; and on Wednesday the Annesley equipage rolled majestically up to Mr. Marks's gate, and the children rushed pantingly in with the intelligence that the carriage had come for Miss Tresham, and the driver said would she please be as quick as possible, for his horses were impatient, and didn't like to stand.

Miss Tresham did not keep the impatient horses, or their more impatient driver, waiting very long. Her trunk was packed, and her bonnet had been on for an hour at least; so there was nothing to do but say good-by—which, however, was very far from being a short ceremony. There was Mrs. Marks and Mr. Marks, and Mr. Warwick (it was immediately after dinner, which accounted for the presence at home of these two gentlemen) and all the children, and most of the servants, to exchange farewells and good wishes with. Mrs. Marks kissed the young governess as if she had been her own daughter, and bade her take care of herself and look her prettiest, and enjoy herself her best; Mr. Marks shook hands heartily, and hoped she would have a very merry Christmas, and they would all miss her, and keep her Christmas-gifts till she came back, and the children pressed round tumultuously, and listened distractedly, while she told Mrs. Marks that if she would look in the top drawer of her bureau the next morning, she would perhaps find that St. Nicholas had visited it; and the servants bobbed up and down in the background, and thrust forward their ebony hands with many "Christmas gift, missis! Wish you merry Christmas, ma'am!" while Mr. Warwick stood by, and looked with his quiet smile at the whole of it.

"I'll take you to the carriage, and bid you good-by there," he said, when Katharine at last turned and extended her hand to him. "You'll never get off, at this rate. Has the trunk gone out?"

"Done strapped on, sir," said Tom, appearing at the open door, and speaking over Judy's yellow turban. "Done strapped on, sir; and John says the horses—"

"Tell John to hold his tongue about the horses.—Miss Tresham, when you are ready, I am at your service."

"I am ready now, Mr. Warwick," said Katharine; and with a last bright glance around, and a last "Good-by all!" she went out of the open door, across the piazza, and down the front walk, attended by Mr. Warwick, and followed by all the children and servants. Mr. and Mrs. Marks went no farther than the piazza, but they stood there and watched the departure. "If ever I thought that such a thing would be!" said the good woman to her husband, as she saw Katharine enter the carriage, and bend forward over the closed door to shake hands with Mr. Warwick and give Nelly a last kiss. Then a touch was given the impatient horses, the carriage disappeared, like a glittering vision, round a turn of the road, and the group at the gate returned slowly to the house—all excepting Mr. Warwick, who went on to town, and, although it was Christmas Eve, and high and low, and rich and poor, were all alike rejoicing and taking a holiday, sat himself down to his grim law-books, and seemed to find the same interest in them that he found there every day.

Meanwhile, Katharine was driving at a rapid and easy pace over the country road that led past the gates of Morton House on to Annesdale. The short December afternoon was more than half gone, the shadows were long, and the yellow sunshine streamed with bright but sad pathos over the distant hills and leafless woods, as the carriage swept along; the driver and footman talked on the box, and the girl inside, leaning back on the soft cushions and watching the fields and clumps of trees fly past, asked herself if she was awake or dreaming, if she would really arrive at Annesdale after a while, or if she would rouse up in her own room in Mr. Marks's house.

On the whole, she came to the conclusion that she was awake, when the Annesdale gates flew open at the approach of the carriage, and, sweeping round the carefully-kept circle, Katharine found herself before a handsome house of soft gray color, built in the Italian style, and spreading over a great deal of space, with large wings and many piazzas. The doors of the hall were wide open, and three or four gentlemen were standing in the front portico. One of them came for-

ward when the carriage stopped, and putting aside the footman began opening the door himself. He was a frank, pleasant-looking person, whom Katharine recognized as Mr. French. "I hope you have not found it cold, Miss Tresham," he said, as, after fumbling at the handle for some time, he at last wrenched open the door. "They ought to have put the windows up to protect you better. Let me bid you welcome to Annesdale. I hope you will have a merry Christmas with us. Did you ever spend Christmas in the country before?"

His voice and his smile were both very genial. Katharine felt glad that her first welcome had been from him, instead of from her formal hostess. It seemed somehow to promise better, to be a better omen of that merry Christmas which everybody just then was wishing everybody else. She answered him, as they went up the steps together, and, when they entered the door, the first thing that met her eye was the greeting—

MERRY CHRISTMAS!

in enormous letters of evergreen fronting the entrance, and running along the gallery that was part of the noble winding staircase which swept around the large octagon hall. On every side of this hall swung heavy garlands in which the deep glossy green of a dozen different perennials contrasted with the crimson berries of the holly and the glistening pearls of the mistletoe. Every picture gazed from a frame elaborately decked; and the large chandelier that swung in mid-space looked like a massive hanging basket, with its many wreaths and long drooping sprays of ivy.

"How beautiful!" said Katharine, standing still to admire. "How very beautiful!"

"Yes, it's pretty," said Mr. French, smiling. "But wait until you see the drawing-rooms. The hall was rather slighted this year, and—Ah, here's Mrs. Annesley."

He broke off thus, as a door on one side opened, and two ladies came out. One was a young and tolerably pretty girl, who ran forward and button-holed Mr. French without ceremony, while Mrs. Annesley welcomed Katharine with more cordiality than the latter had expected.

"Have you seen Spitfire? Oh, Mr. French, do tell me if you have seen Spitfire?" cried the first, in a tone of deep distress.

"My dear Miss Tresham, I am very glad to welcome you to Annesdale," said Mrs. Annesley, with pleasant courtesy.

"I am sure that some of your horrid hounds have got hold of him!" cried the anxious inquirer.

"I am afraid you were detained, and must have found it cold," said Mrs. Annesley.

Katharine was rather confused between the two; but she managed to leave the Spitfire replies to Mr. French, and assure Mrs. Annesley that she had not been detained, that she was not cold, and, that she hoped she had arrived in time for dinner—it having been understood that she should dine at Annesdale on Christmas Eve.

"In very good time," answered Mrs. Annesley. "It has not been ten minutes since the ladies went up-stairs to dress. These holiday times the servants are entirely upset," she added, "and, with all my efforts, I cannot get dinner before five o'clock. It is not so much fashion as necessity which decides my hours. Will you go to your room now?—Maggie, I suppose you will come when you find your dog?"

"I am just going with Mr. French to look for him," answered the young lady, to whom this last question had been addressed. "I don't trust a word these miserable servants say, Mrs. Annesley. They all have a spite against Spitfire, and I believe they would be glad to see those hateful hounds worry him to death. I'll be up-stairs when I find him, but not before."

She walked out of the front door, followed by Mr. French, while Mrs. Annesley drew Katharine toward the staircase. "This way, my dear," she said, quietly. "That is Miss Lester," she went on, as they mounted the steps together. "She is a nice girl, but rather spoiled, and quite eccentric. We can hardly wonder, though, for she is a great heiress, and an only child, so—here—this is your room."

It was a charming apartment, large and airy, with deep, broad windows looking to the south, two canopied and curtained beds, and richly-carved rosewood furniture. A bright fire was burning on the hearth, the toilet-table was glittering with crystal essence-bottles and the like, while two maids stood before it, one engaged in holding and the other in plaiting a long braid of rich, red hair. "This is Miss

* ENTERED, according to Act of Congress, in the year 1911, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

Tresham, Becky," said Mrs. Annesley, addressing the former, who at once dropped a deep courtesy. "Is every thing in order?"

"Yes'm," said Becky, staring with all her might at the newcomer.

"Then, Miss Tresham, I trust you will be comfortable, and I will leave you to your toilet. I hope, by-the-way, you don't object to sharing your room. The house is so crowded, that I am obliged to quarter Miss Lester and yourself together, as you perceive. You don't mind it? I am so glad; for many persons do, and in that case a hostess is rather embarrassed. Dinner at five.—Becky, be sure you attend to Miss Tresham well."

"Won't you take a seat, ma'am?" said Becky, wheeling a chair to the fire, after her mistress had left the room. And, as Katharine took the seat, she knelt down on the hearth-rug and began unlacing her shoes.

"Never mind that," said Miss Tresham, smiling. "Don't let me take you from your work."

"Mistress told me I was to wait on you," said Becky, looking up from the shoes. "That's my business, ma'am, as long as you stays here."

"Indeed! I hope we shall get on well together, then. And does that girl wait on Miss Lester?"

"I belongs to Miss Lester," said the girl indicated. "I've waited on her all my life.—Becky, where'd you put the curling-tongs?"

"You'll find 'em behind the looking-glass," said Becky.—Then she glanced up at Katharine, and added, with a negro's honest admiration, "You're the prettiest lady I've seen yet, ma'am."

"Hush!" said the pretty lady, laughing. "You must not flatter me, or we shall not get on at all. If you want to begin your duties, you may take these keys and open my trunk. I must dress as soon as I get warm."

Before the process of getting warm was finished, or the process of dressing had begun, the door opened, and the young lady whom Katharine had seen below entered the room, followed by a shaggy little Scotch terrier, who incontinently rushed at Miss Tresham, with a vicious snarl.

"Spitfire, Spitfire!—behave yourself, sir!" cried his mistress, with a stamp of the foot, which Spitfire minded about as much as if she had bade him go on. "Don't be afraid of him," she said to Katharine, as Spitfire danced round and round, barking vehemently. "He is the best fellow you ever saw, and he wouldn't bite you for the world."

"I don't trust him, ma'am!" cried Becky, who had retreated into a corner and was valiantly defending herself with Katharine's shoes, while Spitfire, who had deserted Miss Tresham, devoted his energies entirely to her. "Oh, ma'am, please call him away! Oh, Lord, he's sure to bite me!—Get off, sir!—get off!"

"Hush, you silly thing!" cried Miss Lester, with another stamp of her foot, which Becky obeyed better than Spitfire had done. "Come here to me, pet—come here.—Cynthy, catch him and make him stop."

Cynthy put down the curling-tongs and made a lunge at Spitfire, who rewarded her exertions by turning his snapping and snarling against her. Katharine fully expected to see the maid badly bitten; but it seemed that Spitfire's fury was, after all, mere sound. He submitted to be captured, and, with a last futile bark at Becky, lay down on the hearth-rug and growled to himself.

"There, now!—are you not ashamed of yourself?" said his mistress, addressing him in an expostulating tone.—"Don't you ever be foolish enough to threaten him with any thing again," added she, turning severely to Becky. "If you do, he certainly *will* bite you; for nothing makes him so angry as to be threatened.—Miss Tresham, since we are to be room-mates, we might as well make friends. What do you think of Spitfire?"

"I think he is very well named," said Katharine, who had shared the panic.

"Cousin Tom named him," said the young lady. "He thought it was an appropriate name, and I kept it because it was unusual. In fact, Spitfire is a very unusual dog."

"In ill-nature, do you mean?"

"No, in sense. Look how intelligent his eyes are—I really believe he could talk if he chose. Then I like him all the better for his temper—it is such a contrast to those insipid poodles that most girls fancy. I have a bull-dog at home—a great, splendid fellow, named Bulger—but papa would not let me bring him along."

Katharine mentally applauded "papa's" wisdom as she looked at

Spitfire triumphantly established on the hearth-rug, and thought that it might have been her unlucky chance to have been also domiciled with a great, splendid fellow of a bull-dog. She soon found that her new acquaintance was very pleasant and very easy to get on with—a little spoiled, perhaps, as Mrs. Annesley had said, and decidedly a little eccentric, but exceedingly unaffected and good-natured. Contrasting her with many common specimens of the genus young lady, Katharine concluded that she was fortunate in her companion; and she listened with amusement while Miss Lester's tongue ran glibly on, now to the maid, now to herself.

"Get out my purple silk, Cynthy, and the ribbons to match. Did you quill the point lace in the neck, as I told you? A pair of satin boots, while you are in the trunk.—Miss Tresham, did you ever spend Christmas at Annesdale before? No? Then I am sure you will be delighted—every thing is so charming. For my part, I am always glad to get away from home at Christmas. The servants have holiday, you know; and there is so much trouble about getting any thing done. They spend their whole time dancing in the cabins; and if you want the fire made up, even, you have to ring half a dozen times before anybody comes. I always go away from home Christmas; and, if I can, I always come to Annesdale. Adela and I went to school together. Don't you like her very much?"

She stopped after this question, and Katharine replied that she had not the pleasure of knowing Mrs. French, at which Miss Lester's face expressed the liveliest surprise.

"Why, I thought she stayed in Lagrange a great deal. I don't live in Lagrange, you see. I live in Apalaska. But you know Morton, don't you?—and oh, isn't he nice?"

"I know Mr. Annesley, and I think him very pleasant."

"He's delightful, that's what he is," said Miss Lester, a little indignantly. "Cousin Tom Langdon, and Godfrey Seymour, and Frank French, and a dozen more, are 'pleasant,' but Morton is simply delightful. I could fall in love with him," said the young lady, with startling candor.

"Then, why don't you?" asked Katharine, who began to think that her new acquaintance was more eccentric than she had at first supposed.

"Because there would be no use in it," answered the other, with a sigh of frank regret. "Everybody has settled that he's to marry Irene Vernon, and no doubt he will, after a while. She's pretty enough, as far as that goes; but, dear me, looks are not every thing—are they, Spitfire?—Cynthy, come here and take down my hair. I positively won't be dressed for dinner at this rate."

With the efficient aid of Becky, Katharine's toilet was soon completed, and, when the last touches were given, fully deserved the enthusiastic compliments of the maid. "You looks as pretty as a picture, ma'am," said Becky, smoothing down the dress of some soft, blue fabric, that was cut in a style which really made the girl resemble an old picture.

"If you only had your hair rolled up and powdered, you'd look for all the world like my great grandmother!" cried Miss Lester, turning round and much inconveniencing Cynthy, who was busy fastening the body of the purple silk. "Is that the first dinner-bell? Good gracious, Cynthy, make haste!—Here, Becky, come and help her.—Miss Tresham, would you mind looking in the tray of that trunk and handing me my jewelry-box?"

In the midst of the commotion which ensued, a knock at the door passed quite unnoticed, and, after one or two vain repetitions, they all started when it opened and Mrs. French appeared.

"Oh, Adela, you are just in time!" cried Miss Lester, lifting up her hands. "I'm only half dressed, and hurried almost to death. Do, there's a dear! come and help Miss Tresham put these ornaments in my hair."

"Indeed, I have not time, Maggie," said Adela, very coolly. "On the contrary, I have come to carry off Miss Tresham. I knew that of course you would not be ready, so I thought I would pilot her downstairs.—I am Mrs. French. You'll let me introduce myself, won't you?" she said, turning and offering her hand to Katharine.

This was very pleasant; and in five minutes Miss Lester was left to the tender mercies of Cynthy and Becky, and Katharine was going down-stairs in amicable companionship with Mrs. French. She had time now to see the grand scale on which Annesdale was built; to admire the hall paved in black and white marble, and the staircase that swept round and round until it ended in an observatory on the roof.

"It is very handsome," the governess thought to herself; but she was of the Old World, and had seen too many noble residences to be impressed by the splendors of Annesdale. "On the whole, I think I like Morton House better. It is not so new."

"Our party is not very large," Mrs. French was saying. "Not more than thirty people in all, and more gentlemen than ladies. I always like for them to be in the majority. This way, Miss Tresham—this is the drawing-room."

She opened the door, Katharine entered, and for a minute was quite dazzled. It had been a long time since she had mingled in society, and even under ordinary circumstances this large, richly-hued room, all ablaze with wax-lights and full of well-dressed people, would have made a startling contrast to the gray twilight that filled the hall. Then, no amount of social usage can make it a pleasant ordeal to face a number of absolute strangers just at the time when they have nothing to do and little to talk of, and so are at leisure for criticisms and remarks more agreeable to themselves than to the object thereof. Katharine's courage sank down to zero, but nobody would have imagined it. On the contrary, she looked so stately and self-possessed—so full of that rare, graceful ease which only the highest social culture can give—as she followed Mrs. French across the room, that everybody was immediately afflicted with an inordinate curiosity to learn who she was. All of the Lagrange people knew her by sight; but most of the present company were strangers in Lagrange; and a sort of thrill of inquiry ran round the room. "What a splendid-looking woman!" said the gentlemen. "Dear me, what an elegant girl!" cried the ladies. "Who is she?" both parties demanded in a breath.

When it was known who she was, the interest decidedly subsided. A governess who lived in the family of Mr. Marks at Tallahoma, was by no means a very important person in Lagrange estimation, and after a short time the only feeling that remained was one of curiosity to know why she should have been invited to join the party. Thanks to Katharine's own prudence, there had never been much gossip about Mr. Annesley's attentions; and although some few people shrugged their shoulders significantly, and said that it would be as well to be civil, since no one could tell how soon Mr. Marks's governess might be transformed into the mistress of Annesdale, the majority passed the matter over as a whim of their hostess, and thought no more of it.

The young host was standing by the fireplace, talking to Mrs. George Raynor, when a gentleman near him said, "Who is that handsome girl who has just come in with your sister, Annesley?" And, turning quickly, he saw Katharine. She did not see him, for to her eyes the scene was one confused mingling of light, and color, and strange faces. But she had not been sitting down more than a minute when a well-known voice said:

"Won't you speak to me, Miss Tresham, and let me tell you how glad I am to see you here?"

She glanced quickly round, and the bright, handsome face she knew so well was looking down at her. With a smile, her hand went out to meet his.

"Thank you, Mr. Annesley," she said. "Of course, I know to whom I am indebted for being here. You must believe that I am very much obliged for the pleasure."

"You are mistaken," he answered. "You need not think that I have any share in the matter. I need not tell you that I am delighted, that I am happy to see you at Annesdale, but the pleasure became twice a pleasure when my mother asked you, without the slightest knowledge on my part."

Katharine opened her eyes a little; and, if it had been anybody but Annesley who spoke, would certainly have doubted the assertion. But, before she had time to reply, Mrs. French broke in—Mrs. French, whose ears were good, and who had no such implicit reliance on Morton's promise as that which her mother had expressed.

"Miss Tresham, is Morton asking you to help us in our Christmas-Eve arrangements? He said he thought perhaps you would."

"I said I was sure you would," said Morton. "Adela has arranged some *tableaux* and music for the edification of our friends; and I felt sure you would aid, if need be."

"Morton describes very badly," said Mrs. French. "Some *tableaux* and music are very indefinite. In the first place, it is no *tableaux* at all, but only a little scenic effect; and, in the second place, we have arranged the musical programme, with the exception of one part. We want a Christmas anthem—solo. Will you sing one for us?"

"What sort of an anthem?"

"Any that you can or will sing."

"Would the 'Gloria' from Mozart's Twelfth Mass answer?"

"It would be charming! Will you sing that?"

"With pleasure—but—no. I cannot. My music is not here."

"I will send for it," said Morton, before his sister could speak. "A messenger shall go instantly."

He started up, and was about to leave the room, when Katharine called him back. "I must send a message to Mrs. Marks," she said. "She would not know where to find the music else. Please tell the servant to ask her to look—"

"Had you not better come to the library and write a note? It would be much more certain."

"Don't carry Miss Tresham off, Morton," said his sister. "Dinner will be ready in a minute."

"I won't keep her a minute," he answered; and, without giving Katharine any option in the matter, he drew her hand within his arm, and led her from the room. The chandelier was lighted by this time, and the hall looked brilliant in all its guise of holly and mistletoe. To Katharine, it suggested a large mystic temple; and Miss Lester, who was just then descending the staircase, might have passed for its priestess, in her rich purple silk and pearl ornaments. She stared a little, but Morton gave her no time to speak; he led his companion hastily forward, and opened the library-door.

"You will find pen, ink, and paper, on that table," he said. "I will go to find a messenger, and be back for your note in a second."

Almost in a second he was back, and, closing the door behind him, came and stood by the table, while Katharine dashed off a few lines to Mrs. Marks.

"Tell her to send *all* your music," he said. That was the only suggestion he made.

He stood quite silent, watching the graceful figure and fair face that made such a pretty picture, seated by the table with its shaded lamp, and the dark book-lined walls behind. It looked so home-like to see her there—there under his own roof, in his own especial room—that the young man had hard work to keep his lips sealed. But in that very spot he had promised his mother not to speak without giving her warning, and he would hold fast to that promise through any temptation. When Katharine looked up, he was gazing, not at her, but at the St. Cecilia over the mantel-piece, and, when she extended her note, he took it and put it into his pocket. "I will deliver it to the messenger as soon as I have seen you to the drawing-room," he said. "I had better take you back at once, or Adela will be impatient."

Katharine felt sure of this, and rose to go; but at the door he stopped—stopped as if he must say something, however little, before letting her go.

"One word, Miss Tresham," he said, hurriedly. "You don't know how very, very happy it makes me to see you here."

CHAPTER XVI.—ST. CECILIA.

AFTER dinner, Miss Tresham was sitting alone in a corner of the drawing-room. But let no one suppose from this statement that she was feeling snubbed or neglected, and, consequently, misanthropical or cynical, in even the least degree. She had been taken in to dinner by Mr. Langdon—the "cousin Tom" of whom Miss Lester made frequent mention—and she had found him exceedingly pleasant, while he, for his part, had been decidedly charmed. Nevertheless, after dinner he drifted away; but there were others ready to fill his place, and if, instead of being entertained, Miss Tresham was sitting alone, it was as much a voluntary withdrawal on her part, as any thing else.

In fact, the young governess soon found that she was among, but not of, these people, who laughed and talked in Mrs. Annesley's drawing-room. They were all of the best school of breeding, and, meeting her on neutral ground, they never dreamed of showing that, under other circumstances, they would not have considered her an equal. Vulgar incivility, and more vulgar patronage, were simply impossible to them; and when they accosted her there was no shade of manner to show that it was a condescension on their parts, and an honor on hers. But they had their world, and she had hers. They knew each other, and each other's friends and affairs, and had a hundred topics in common; while she might have dropped from a cloud, or been transported from the Sandwich Islands, for all she knew of these matters. One or two ladies had tried to talk to her, but somehow

there was not much to be said on either side. Did she like Lagrange?—had she lived there long?—did she not think Annesdale a beautiful place?—were not the rooms prettily decorated?—Adela French had exquisite taste, and had cut out all the letters herself. Did Miss Tresham like German text?

After some disjointed efforts of this description, it amused Katharine to hear the same person turn to a group of her friends and launch into conversation of the most animated kind. She would grow eloquent on Laurie Singleton's marriage, and who his wife was, and what her grandfather's name had been, and in what degree they were related to the Churchills, and how Judge Churchill had sent the bride a diamond necklace, and how elegant were the dresses, that had been ordered direct from Paris. "After all, it is no wonder that these people find it difficult to talk to me," thought Katharine to herself. As is generally the case, she got on better with the gentlemen. Even the ordinary man inhabits a less narrow and conventional world than the ordinary woman, his very position as man giving him a wider field of knowledge and a freer scope of thought. Then, few men are not stirred into conversational effort by a fair face and a pair of bright eyes; and, where two strangers of the same sex would sit and stare at each other, two strangers of different sexes will soon find topics on which to grow sociable. "The governess is really charming," Mr. Langdon had told his friends; and few of them felt disposed to doubt the assertion. But still, they were engrossed with pretty girls, whom they knew very well, and to whom it was no effort to talk, and the charming governess, by degrees, wandered away into the corner already mentioned.

There she sat, like the historic little Jack Horner, with whom we are all acquainted; but lacking the Christmas pie with which that hero solaced his retreat. Instead, she opened a book of engravings, and tried to appear interested in its contents. A ripple of talk was sounding all round her, a pretty dark-eyed girl was singing at the piano, a glorious fire roared on the hearth, the wax-lights burned with that steady lustre which no brilliancy of gas will ever rival, the pictures gazed, the mirrors gleamed out, of green-wreathed frames, people came and went continually, and the whole bright scene was, to Katharine, like a play—a picture—something scenic and unreal, but yet very attractive. She liked it better than her book, which was full of portraits of dead-and-gone beauties—as if the earth was not as rich in loveliness now as ever, or as if any one in his senses would give one face where life still brightens the eye and colors the tints, for all the cold silent beauty that ever mocked decay on canvas. "There is no one here half as pretty as Miss Vernon," thought Katharine; and, as she thought it, Miss Vernon crossed the room, and came up to her.

"A penny for your thoughts, Miss Tresham," she said, smiling. "I have been watching you for some time, and I am sure you were thinking how foolish and frivolous we all are."

"On the contrary, I was thinking how pretty you all look," answered Katharine, smiling in turn. "Why should I think you foolish or frivolous? It is only people of very superior wisdom who can afford to do that sort of thing, and, for my part, I must confess I always rather doubt their sincerity. You may be sure Diogenes would never have been able to make a success in society, or else he would not have taken up his residence in a tub, or gone about with a lantern searching for what he could easily have found by God's own daylight."

"I am glad to hear you say so, for indeed I think there is more good in the world—even in the fashionable world—than cynics give it credit for. We look too much at codes, and not enough at individuals—that is all."

"And we are too prone to judge hastily from the outside, to decide from mere appearances," said Katharine, making a personal application of her truism, and thinking how little she had expected to find this young beauty so full of the frank, sweet grace of true womanhood.

"Adela tells me that you are going to sing a Christmas anthem for us," said Miss Vernon, changing the subject. "I am so glad, for I want to hear your voice."

"I am afraid you will not hear very much."

"Will I not? Then Mr. Annesley has certainly lost all sense of truth. If you will excuse me, however, I will take the evidence of his word until I have that of my own ear. When will your music come?"

"Mr. Annesley sent for it before dinner, and it ought to be here now."

"Surely yes—since it is eight o'clock. But, no doubt, the messenger went on into town, and guns, and fire-crackers, and every description of noise, reign there to-night. No creature is so young or so old, so careless or so indifferent, as not to remember and rejoice that this is Christmas Eve."

"I know what it was last year," said Katharine, with a slight shrug. "I never saw people throw themselves with such abandon into rejoicing. I like to see it; yet I cannot help wondering how many have any remembrance of the cause which draws it forth."

"If you mean devout remembrance—thought of Who came to-night, and why He came—I am afraid there are but few. But still, at least they do not forget Him, and is it not better that Christmas should be celebrated thus, than passed over in cold silence?"

"Oh, a thousand times better! Don't mistake me enough to suppose that I think otherwise. But I wish the two could be united."

"Yes, so do I," said Miss Vernon, slightly sighing.

It was just at this moment that a servant entered the room with a large parcel, which he took to Mrs. French. She was talking eagerly, and opened it without thinking—whereupon a music-portfolio tumbled out.

"Oh, it is Miss Tresham's music!" cried she; and, while the gentlemen picked up the scattered sheets that strewed the carpet, she carried the half-emptied portfolio over to its owner.

"Miss Tresham, your music is come," she said, with a smile. "And you must really excuse me for opening it. I was not thinking, and Guy handed it to me without saying a word. Here is a note—I have not opened that, too. Do look and see if the 'Gloria' is all right."

While Katharine was looking for the "Gloria," and failing to find it, Mr. Langdon came up with several pieces of music in his hand, from one of which he was humming a few bars.

"Miss Tresham, do you sing this?" he cried. "It is a lovely thing, and I have never found any young lady who knew it. I heard Malibran sing it when I was in Europe. Won't you sing it for me now?"

"Not if you heard Malibran sing it last, Mr. Langdon.—Mrs. French, the 'Gloria' is not here. It must—"

"Here is some more music, Mrs. French," said a gentleman, coming up.

"Oh, thank you, Mr. Talcott.—Miss Tresham, here is the 'Gloria' now. Miss Tresham, Mr. Talcott. I introduce this gentleman partly because he is worth knowing, and partly because I see from his face that he has something he wants you to sing."

Mr. Talcott, who was young and rather diffident, bowed and blushed.

"If Miss Tresham would not mind," he said. "I see a song here—a little ballad—that my mother used to sing, and that I would like to hear."

"Your mother is not half so terrifying as Malibran," said Miss Vernon, laughing. "I am sure Miss Tresham won't refuse."

But Miss Tresham did refuse, or rather Mrs. French refused for her.

"I won't hear of such a thing," said the latter. "Miss Tresham can sing for you all to-morrow; but to-night I don't want anybody to hear her voice until he hears it at twelve o'clock.—Irene, will you come with me a minute. I want to consult you about—"

What was not audible.

The two ladies walked away talking, while the two gentlemen lingered to look over Miss Tresham's music, and show her what they wanted her to sing the next day.

Katharine had the rare art of being able to make herself agreeable to several people at once; so neither of them felt *de trop*, and both of them were so well entertained that they felt no inclination to change their quarters. In fact, they remained so long, that a lady on the other side of the room gave it as her decided opinion that Miss Tresham was a flirt.

"Look how she keeps both those men pinned to her side!" said this astute observer. "I never saw a girl who *wasn't* a flirt succeed in doing that. Of course, there's nothing in keeping one man, for the poor creature may be in such a position that he simply can't get away. But, when there are two, either one of them can go at any

time, and, if they stay, it is certainly because they are well entertained."

Hour after hour the night slipped away—gay talk, laughter, and music, made it speed fast, and few of these heedless people remembered that, while they jested, the minutes rolled on to the verge of the great Feast of the Nativity. Katharine alone thought of the mystical sacrifice which all through this night circles the world, as, wherever the ancient Church has planted her standard, the midnight-mass is offered, the altar blazes with starry lights, the fragrant incense rises, the glad voices break forth, and with their triumphant strains echo those who sung, eighteen hundred years ago, to the shepherds on the plains of Judea. She alone thought of the crowded sanctuaries, and yearned to make one of the happy multitudes who, like the Magi of old, bent before their hidden Lord. But something whispered "Peace!" She stepped to one of the windows, and drew back the curtains. The night was clear starlight, and the great dome of heaven seemed fairly quivering with radiance—fairly ablaze with the splendor of myriad constellations set on a field of deepest steel-blue. In the east, one great planet glowed like a lesser moon. All the frosty night lay sparkling and still before her, but she knew that, over yonder, Tallahoma was ringing with merry uproar, and that, beyond Tallahoma, towns, and cities, and villages, echoed the same mirth.

As she turned her gaze to a hill on her left, a broad red glow met her eyes—the light from the negro-cabins, in which was seen the shifting of many forms, and from which, if the window had been lifted, she could have heard the well-loved sound of the fiddle and the banjo, and the sound of dancing feet. And it was all because of Bethlehem that for a short space the world forgot its feverish strife, and lapsed into these childlike pleasures! O Christian heart, rejoice and take hope! Better to honor ignorantly than not to honor at all, and, while you gaze forth sighing, wider and wider spreads the light of that star which once shone above the Child of Nazareth.

While she was still at the window, and Mr. Talcott still talked unheeded commonplaces, there was a stir in the room which attracted her attention. The door opened, and a servant entered carrying an enormous silver bowl filled with egg-nog, made after a receipt which was the secret of certain Southern households under the old *régime*. Another followed with a salver, bearing glittering goblets and baskets heaped with cake of every order and degree. These refreshments were the regulation "Christmas cheer," and thirty, twenty, nay, ten years ago, Christmas Eve would scarcely have seemed Christmas Eve if they had been lacking. After the bowl was deposited in state on the centre-table, the bearer turned and addressed his young master, who was standing by.

"The Kris-Kingles is out here, Mas'r Morton, and they heard as how some of the ladies said they would like to see 'em."

"I said so!" cried Miss Lester, starting from a sofa, where she had been *tête-à-tête* with an irresistible-looking gentleman—that is, a gentleman who thought himself irresistible—"I said so, Mr. Annesley. Do let them come in! I am so fond of Kris-Kingles!"

"Certainly, Miss Maggie," said Morton, laughing. Then to the servant: "Tell them they may come in, Victor."

Victor said "Yes, sir," and, apparently much gratified, retired with his grinning associate.

After a short interval, which the company in the drawing-room devoted to the egg-nog, there was a shuffling of many feet outside the door, a subdued tittering, a touch or two of the strings of a banjo, then a chorus of voices broke into the wild refrain of some negro-ditty, and, when the door was thrown open, the redoubtable Kris-Kingles—the mingled terror and fascination of every Southern child—appeared drawn up in the hall.

To Katharine alone it was a novel sight, the fantastically-dressed and masked group in the foreground, and the dusky faces, beaming with pride and delight, that made a semicircle round the wall, and peered in at the open door.

"What are they for? what do they do?" she asked of Miss Lester, who chanced to be standing by her.

"Oh, don't you know about Kris-Kingles?" cried that young lady, with surprise. "Why, on Christmas Eve some of the negroes always dress up in this way, and go round to all the cabins, and sometimes scare the others nearly to death. I can remember when I was a child I used to be awfully afraid of them. When they come in the house this way, it is for Christmas-gifts. I wish they could dance for you—

you would like to see that.—Mr. Annesley, would it hurt the floor very much if they danced one dance for us? Miss Tresham never saw any Kris-Kingles before."

"It would not hurt it at all," said Morton. "Boys, give us a dance before you go."

The "Kris-Kingles" were not at all bashful, and needed no second invitation. In a minute, the measure of the music changed, and, still accompanying it with their voices, they broke into a wild, uncouth dance, impossible to imagine, and equally impossible to describe.

"I don't wonder children are afraid of them," thought Katharine, as she watched the hideous pasteboard masks bending backward and forward, the agile feet that kept such well-marked time, and the fantastic figures threading in and out of what seemed inextricable mazes. Some of the steps were most remarkable, and various double-shuffles and pigeon-wings elicited the liveliest applause from the audience. But the performance was soon over.

"Dat's 'nuff, boys," said the leader, coming to a pause. "Don't let the white folks git tired of you. Make your bes' bow now, and tell de ladies and gentlemen you wishes 'em a merry Christmas and a happy New-Year."

"Merry Christmas and happy New-Year to you all!" echoed the ladies and gentlemen aforesaid; and most of them went out into the hall to bestow that Christmas-gift which the Kris-Kingles had delicately refrained from asking. After this, the gay pageant filed out, and went its way over the hill to the quarters, the united voices swelling into fuller song as they receded, and waking all the echoes of the silent night.

"It is eleven o'clock," said Mrs. French, as she went back into the drawing-room, where Mrs. Annesley and a few elderly ladies had the fire all to themselves. "It is time to arrange our *tableaux*, as Morton calls them.—Irene, Maggie, Flora—all of you—come!"

Most of the young ladies rose at this summons, and left the room. The gentlemen fell into knots, and talked principally to each other, during the half-hour which followed. Morton snatched a few minutes with Katharine; but his mother soon managed to call him away. At the end of the half-hour, a messenger came from Mrs. French for Miss Tresham. At a quarter to twelve, a servant entered, and put out all the lights. The hush of the next fifteen minutes was very impressive. Such an idea had never entered Adela French's head; but to more than one present unconsciously solemn thoughts came, and this darkness seemed to typify the shadow which rested over the world before the blessed light of Christmas dawned. In the midst of profound silence, the clocks began to strike twelve. At the first stroke, the folding-doors which divided the two drawing-rooms, and which had been rigidly closed all evening, moved noiselessly apart; into the darkness flashed a dazzling flood of light, a scene so brilliant that it almost blinded the vision, and a chorus of silvery voices, breaking into the "glad tidings of great joy."

Not being very well used to scenic effects, the spectators held their breath in astonished admiration. The room into which they gazed was wreathed with garlands, and blazing with lights until it lost its semblance of a room, and looked rather like some enchanted palace. At the farther end, an arch of green was thrown, and above, in illuminated letters, ran the inscription, "Unto you is born this day a Saviour." Under the centre of this arch stood the Christmas-tree, glittering from the lowest limb to the highest summit with countless tapers and colored lights. Behind was a stage, arranged in careful perspective. Gazing from the darkened room, the full glory of the abounding radiance seemed to centre here, giving an effect beyond description to the figures upon it. In the foreground was an Oriental group—the Judean shepherds, as they watched their flocks—while beyond and around were slender forms clad in pure white, whose voices rose in one united chorus as they sang an anthem exultant enough to tell the world Who had entered it on that December night.

As the chorus died away, the tones of a cabinet-organ fell on the ear, and in the midst of a hush, so deep that it could almost be felt, one pure, liquid voice rose and soared aloft in the sublime "Gloria" of Mozart. In all the great world of tones, there is hardly a strain which, for triumphant majesty and noble worship, can equal this. There is scarcely more than an alloy of earth and earth's supplication in it. We forget that we are still "poor banished children of Eve," that we are yet "weeping and mourning in this valley of tears;" we catch the spirit of the angelic hosts, and our hearts are borne upward by the tones in which the master's genius and devotion live forever.

"Gloria in excelsis Deo!" sang the ineffable sweetness of that silver voice, and few were so cold or so careless as not to echo the cry. In the breathless silence, every word of the grand old Latin was audible, and every word stirred those listening hearts. How full of glorious triumph rang the voice in the "Domine Deus! Agnus Dei! Filius Patris!" How it seemed smote with a sudden remembrance of humanity, a sudden yearning sense of need in the "Qui tollis peccata mundi! miserere nobis!" How grandly it rose again to the very gates of heaven in the "Quoniam tu solus Sanctus!" and, after one great burst of inspired praise, sunk at last into silence.

When the solo ended, people remembered where they were, and, turning, stared at each other. Who was it? What voice had carried them so far out of themselves, and out of the world in which they lived—the smooth, conventional, easy world, in which Christmas was only a pleasant occasion of friendly meeting and convivial sport? All these lights and wreaths, this *tableau* arrangement, and chorus of pretty girls, were a very agreeable entertainment to the eye; but here—here was something which seized them unawares, and, wrenching them out of their ordinary life, made them realize what it was they had met to celebrate, forcing upon them thoughts which to the common worldly mind are any thing but agreeable. It was the greatest proof of Katharine's triumph that her earnestness had so far communicated itself to them that they thought of her and her voice only as a secondary consideration.

"How beautiful!" they cried, when it was over; but they waited until it was over to do so. There was no time to say much, for the chorus broke into the noble strains of Milton's "Hymn on the Nativity," and the last verse was still echoing when the folding-doors closed on the scene.

The company found that, while they were engrossed, servants had entered and relighted the candles; so the drawing-room looked quite like itself when they turned round—only very, very commonplace, after that glowing world of sight and sound. Mrs. Annesley was immediately overwhelmed with congratulations, and soon, to her great annoyance, beset with inquiries concerning the singer of the "Gloria." Good Heavens! what a beautiful voice! Was it really that girl who is said to be a governess in Tallahoma? Where could she possibly have learned to sing so divinely?

"For all we know, she may have been an opera-singer before she came to Lagrange," said Mrs. Annesley, striving hard to conceal her vexation, and to speak in a careless tone. "Adela was very anxious to secure her voice, which is, as you say, really beautiful; so I asked her here. But I should not like for any one to think that she is a friend of ours."

"By George! who would have thought the pretty governess could sing like that?" said Mr. Langdon to Morton Annesley.

To which Morton replied, stiffly enough, that he always knew Miss Tresham had an exquisite voice, for he had often heard her sing.

"It did not astonish me at all," he said. "The pretty governess!" he repeated to himself, as he walked off. "And that is the way they talk of her! I wonder how I shall ever contrive to hold my tongue during this week which is to come?"

When the folding-doors were once more opened, and the company were bidden to admire and inspect the Christmas-tree, which was loaded with gifts, Annesley went up to Katharine and held out his hand, without in the least regarding the people standing near.

"Let me thank you for a pleasure which I shall always remember," he said. "You have given me my best Christmas-gift. I shall never again think of St. Cecilia without thinking of you. Don't Catholics always have a patron-saint? She ought to be yours."

It was verging close upon two o'clock when the party finally separated, and Katharine went up to her chamber. On opening the door, she found that Miss Lester had preceded her, and was sitting on the hearth-rug, engaged in petting and soothing Spitfire.

"Cynthia left him up here by himself all the evening," said the young lady, indignantly, when Miss Tresham appeared. "I can't imagine what she meant by it. Of course, she knew that she ought to have brought him down to the drawing-room to me. The poor fellow can't bear to be left alone. Miss Tresham, wasn't it all charming? There's no place like Annesdale, I think. The Christmas-tree was beautiful, and all the presents so elegant! Oh, dear!"—with a tremendous yawn—"I am terribly sleepy. I am sure I shall not get up till dinner to-morrow."

[TO BE CONTINUED.]

MAHS' LEWIS'S RIDE.

EVVAH sence I kin remembah,
Dis place belong to de Blan's;
Held about six hund'ed akahs;
Wuhkt about twenty-one han'a;
One o' de best o' plantations—
Dat's jest as sho as you bo'n;
Raised a great heap o' tobacco;
Wasn't no eend to de co'n.

'Longed to Mahs' Dan'el, who raised me—
Den when he died, ow Miss Grace
Morried huh cousin, Mahs' Lewis—
Dat's how he come by de place.
He had bin raised in Prince Edwa'd,
Close on de Buckin'm line—
Mighty fine man was Mahs' Lewis!
Yes, sah! he was mighty fine.

See dat bay hoss in de pastah,
Dah wid his neck on de fence?
Mo' dan a good many people
Dat hoss has lahnin' an' sense.
Favo'ite hoss wid Mahs' Lewis;
Offen to me he has sed—
"I'll ride dat hoss, Uncle Petan,
Seems to me, ahter I'm dead."

"Mighty quah hoss in de pastah?"—
Whah fo' he quah?—"You dunno?
"Kase o' de bah places on him?"—
Dem's whah de woun's wah, fo' sho.
Dat hoss has bin in de battle,
Bin whah de blood's runnin' red;
Dat hoss come back from de battle,
Totin' de fo'm o' de dead.

Dis way it happen: De Yankees
Come yeh dat yeah in great fo'ce;
Grant was dah ginnul commandah—
Guy 'em a pow'ful disco'se.
All o' de monsus grand skrimmage,
We f'om de po'ch yeh could see—
Yandah was Grant an' de Yankees;
Yandah de rebels an' Lee.

Yeh on de po'ch sot de mahstah;
Yandah smoke rose in de breeze;
Blue an' gray lines in de distance
Went in an' out o' de trees.
Dah we saw light in de distance
Flashin'—an' 'twasn't de sun's;
Hud de bim boom o' de cannons,
Hud de ping pang o' de guns.

Suddintly sung out Mahs' Lewis:
"Dah ah de cust Yankee cuhz!
Retch f'om de hooks dah my sabah!
Retch me my swo'd-belt an' spuhz!
Saddle an' bridle Suh Ahchy!
Bring him aroun' to de do'!
He'll tote me safe f'om de battle,
Aw I'll come back nevvah mo'!"

Den I felt bad. S'I, "Mahs' Lewis!
Knows you ain't fit fo' de waw;
You ah too ole fo' sitch fightin';
Bettah stay yeh whah you ah."
S'e—an' his eyes flashed like fox-fire—
"Bring me Suh Ahchy, I say!
One man, dough aged an' feeble,
Might tu'n de tide o' the day."

Well, sah, he'd heah to no reason,
Dahfo' Suh Ahchy I fotched;

An' when he rid down de high-road,
 Yeh, I sot patient an' watched—
 Watched yeh, an' lissent, an' lissent,
 Hea'in de rattle an' ro';
 Seein' 'em, backwa'd an' fo'wa'd,
 Blue an' gray lines come an' go.

So dey fit dah all de daylight,
 Fit 'twell de sun had gone down;
 Den come de dahkness an' silence
 Shadin' de whole place aroun'.
 Yeh, on de po'ch I sot waitin',
 Waitin', an' dreckly I heah
 Clank o' dat swo'd on de saddle,
 Ring o' dat hoss comin' neah.

Fastah an' fastah I heah 'em,
 Poundin' an' poundin' de groun'—
 "Lo'd be praised, dat is Mahs' Lewis!"—
 Dat I knowed well by de soun'.
 Up in a gallop, Suh Ahchy
 Come to de po'ch, den he stan';
 Dah, in de saddle, Mahs' Lewis
 Sot like a captain so gran'.

"Welcome back! Welcome, Mahs' Lewis!
 Bet you made somumum die!
 S'pose you 'light dah at de hoss-block;
 Dat's a heap easier," s'I.
 Seein' he made me no answer,
 Tetched him—Lo'd! how I did staht!
 Dah he sot, stiff in de saddle,
 Dead, sah! shot right froo de heaht!

A LABOR OF PEACE.

THE Righi, famed for its extensive and beautiful prospect, is familiar to every Swiss traveller. Almost in the centre of Switzerland, an independent mountain, it rises to the height of five thousand five hundred feet, its western slope bordered by the majestic Lake of the Four Cantons with its many steamers. Its rich Alpine pastures are browsed, in summer, by some three thousand kine, and numberless flocks of sheep and goats, a hundred and fifty *Sennhütten* (cowherds' sheds) are scattered over its meadows, and many paths lead up to the summit, the Kulen, which, as every one knows, offers at sunset and early sunrise an extraordinary, almost an un-

equalled view. Among these paths are some of no great steepness, though scattered here and there with rocky steps two or three feet in height. Many, however, of the fifty thousand annual Righi tourists will be glad to hear of an enterprise which will be a relief to tired wayfarers by this autumn, but promises even greater things for the future. We have to thank the discernment and perseverance of the Swiss engineers, Colonel Adolph Raff in St. Gallen, N. Riggensbach in Olten, and Olivier Zschokke in Aarau, for the Righi Railway. To inspect personally this enterprise, the very possibility of which has been so contemptuously doubted, I started one fine morning from Vitznau, a quiet, smiling village on the right bank of the lake.

A few minutes' walk up the road brought me to the still unfinished station, a trim little building in the Swiss chalet style, but without ornamental carved work. Beside the waiting-room are the ticket office, employés' room, etc., but nothing on the whole of particular interest. Some twenty paces off are the locomotive and carriage shed and between the two buildings is the turn-table to set the locomotive on the line which debouches here.

From this point my pilgrimage began, rising from level to level as in a staircase, and at first going pretty straight in and with gentle grade, so that I had ample leisure to watch the laying of the rails.

On the oak sleepers, laid scarcely two feet apart, were longitudinal timbers mortised into them, so that the rails lie upon a sort of gridiron. This system is evidently unavoidable to prevent any thin like displacement, especially slipping down, and fully answers its purpose. If any "giving" had been possible, it must have occurred before now, for during the building the locomotive has carried up heavier freights in building-material than it will perhaps ever have to stand again.

Between the metals runs the firm, massive cog-rail into which the cog-wheel of the locomotive must gear, the rail itself being of wrought iron, while the cogs, for solidity, are of cast-steel and welded in. This rail is the only essential feature of difference from ordinary lines, according to the well-known American system for mountain railways which has proved not only practical but durable, not to mention its cheapness for repairs.

Directly over Vitznau, the line strikes a sharp grade along the mountain, the so-called Vitznauer Stock, which it keeps as far as the tunnel, requiring here the first cutting through the stratum of the mountain giant. And here the first real difficulty of the construction shows itself; talus-slopes could in many places not be used, and the

THE RHIGI RAILROAD.—I.

road had to be built up with high buttresses where the ground falls away in steep precipices or deep chasms. The necessary blasting operation have nipped many hands some chestnut-trees in the valley and they look mournfully upward to the work of human hands, to the towering cliffs under whose shelter they have peacefully thriven for so many a year.

The farther I climb, the more fas-

minating be-
comes the
whole opera-
tion of laying
out the road ;
I have never
seen a tract
which offered
such variety
of construction
in so
short a space.
Here they had
to use a high
dike — there
a rock-cut-
ting, a but-
tress, a talus,
a bridge; and
then, besides
all this, what
a superb, nay,
magical pan-
orama of Na-
ture! fairer,
richer, grand-
er, as I
mount.

For a short
distance the
line leads
through a
wood, and
emerging we

have the most superb prospect spread before our eyes. At our feet lies pleasant Vitznau, a long reach of splendid orchards; and, beyond, the Lake of the Four Cantons, its gleaming surface coquetting with the sunbeams and casting them up to us in dazzling radiance. A steamer is creeping solitary over its surface, bearing its cargo up the lake to Eusau and Brunnen, and down to Stanstad and Hergiswyl. The Büsgenstock lifts its gloomy head from the lake, and over it peep down the haughty heads of the Bernese Alps, Jungfrau, Eiger, Wetterhorn, etc., and farther to the left the Uri Rothstock, Titlis, and the rest of them, mighty forms of the older world, the bearers of eternal snows glowing at the sun's first kisses, and purple with its departing beams. The series ends with grotesque old Pilatus, serious and almost awful in his grandeur, casting his shadow deep down to the lake, and reaching with his pinnacles aloft to the clouds. Pilatus is the confidential friend of these vaporous palms. While, at the approach of bad weather, he is the first to fold himself in misty mantle, on fine days he wears his hat, as to-day. How many a fair legend hangs about this proud majestic mountain giant, to one of which, indeed, he owes his name.

The Roman governor, Pilate, who delivered up our Saviour to the people, in his despair is said to have plunged into a lake in this mountain, rising even now, a vision of fright, from its depths, when the lightning flashes and the thunder rolls. And so the mountain got its name.

So standing, one never wearies gazing out over the lovely landscape, and I don't know how long I had stood there when the sudden whistle of the locomotive scared me from my reverie.

Down comes the train from above, but without danger, or reason for apprehension; it is running, its usual rate, at about the speed of a horse's trot. Nearer and nearer it comes, and suddenly, with a jerk, it halts. A man jumps from the train and comes toward me; it is my old school-friend, the director of the works. He had recognized me, and, there being no passengers aboard, had the train stopped; and so I had the best of chances to inspect both locomotive and carriages.

Very queer is the locomotive with its upright boiler, necessarily so set, to keep the depth of water the same throughout, which would have been impossible with a horizontal boiler. For further assurance, the boiler is so built that on the grades it stands perpendicular, and consequently sloping when on a dead level.

THE RHIGI RAILROAD.—II.

In place of the driving wheel come the two flanged cog-wheels, which gear into the cog-rail. The fear of accident by the breaking of a cog, is quite groundless, as almost at the same instant three cogs bite the rail, so that in the supposed case nothing more than a slight jar could result. An essential auxiliary to this is the admirable system of brakes, by which the train can be stopped in an instant; and here it may

not be out of place to mention all the precautions for the safety of the train, to get rid of every prejudice, with its resultant anxiety.

The brakes, on the lever system, are applied not only on the locomotive, but on every carriage as well, and, as the carriages are never coupled, each separate carriage can be easily stopped, a matter of great importance in down-grades. On up-grades the locomotive is never before, but behind, so that the carriages are not pulled but pushed, an arrangement showing the caution with which the whole thing is managed.

My friend declared that, in the long time during which the road had already been in use, not the slightest accident had happened, and the only imaginable one would be the rolling down of a mass of rock, or a smaller stone getting on the line and damaging the flanges of the driving-wheels. But, not to mention that the road, during use, is under constant inspection, such an accident is really impossible with decent attention from the employés on the locomotive, who always have the train completely under command, and can at any time stop it quickly enough to remove the obstacle or let the danger pass by.

The carriages, wedged up over the wheels to stand perpendicular in the sloping line, are also different from those on ordinary roads, being omnibuses with eighty-one places each, forty-five below, and thirty-six on top. The last will probably be used by bolder tourists, and in fine weather, as they are without roof, and so offer a capital chance at the prospect; it must be sheer luxury to ride up and down in this way. I declined it, however, spite of my friend's invitation, wishing to walk farther up the line.

"We shall meet again!" cried he, after me; the train rumbled downward, and I set my stick and my face mountainward. I had scarcely got over fifty paces when the line made a sharp curve; on the left were dark thickly-wooded slopes, on the right the grotesque world of mountain-shapes, and right ahead the tunnel, some hundred and fifty feet long, through a mighty cliff of solid rock. Where we step out of the tunnel the rock falls away almost perpendicularly to a depth of at least thirty to forty metres. Above it rises more gradually to an immense height, in smooth gray walls, the terrible Grubisfluh. Farther down a brook shoots foaming through, under the road, and rushes roaring down along the walls of this mighty chasm, which has been spanned with a viaduct of almost unequalled beauty. On two piers of trestle-work, the bridge, seventy-seven metres long, makes a bold sweep over the abyss to the abutments on the other

side, where with steeper grade it gradually straightens out from its zigzag course. The hither abutment is formed by the rock. From a distance the bridge looks a little doubtful—especially as the train is passing, it seems every instant as if it must give way; but, for all its light appearance, it stands firm and solid, and it is scarcely within possibility that the winter weather will damage the trestle-work.

The view from the bridge is amazingly fine; in the background, the towering cliffs; beneath, the noisy torrent, and the dark firs, and still farther down juicy meadows and shady orchards, with the gleaming lake and majestic Pilatus beyond. This superb view is the more striking from the limitation of our range of view just before.

Higher still I mount upon the road-bed; above the bridge the grade grows gentler; up to the tunnel it was not under twenty-five per cent., but now averages from twenty-one to twenty-two per cent. With the diminished grade the construction grows easier, though here and there a bridge still has to be built over a deep chasm, or a gallery blasted for the continuance of the line. We come here to the high pasture-region and softer strata, and the masses of stone and rubble from below were used here to great advantage.

The *Kaltbad* is reached; for a little way farther, to about the level of the *Staffel*, the line continues, and ends at the junction of the different paths leading to the Kulen, which is some hundreds of feet higher. Here we find a station building, and the traveller has reached the first famous point of view on the Righi. I ordered a little refreshment, took a hasty look around among the strangers, who, "*Berlepsch*" in hand, were admiring the superb prospect, and then started downward as I had come. How much more calmly can one enjoy the landscape, how light and free the respiration, when one walks on in this fashion toward all the splendors which meet the eye! In a short time I was back again at the bridge. The locomotive which had wheezed its way up in the mean time, was steaming in the tunnel, and this time I was glad enough to take a trip, and especially to risk the dreaded downward journey. I got in, the locomotive started, and the carriage rolled after, just as quietly as in a buggy on a country road. As I got out I had no occasion to investigate whether my joints were all in order, a research which we have to institute often enough on our railroads. The speed is, to be sure, not frantically swift; a good runner could keep up with it, down-hill, that is. An instance of this is, that it takes an hour, at least according to time-table, to get over the seventeen thousand feet or so of road. During the season there will be at most three regular trains daily, but extra trains according to occasion. That the road will be well supported, is sure, and it needs it, for the cost of construction amounts to the pretty little sum of two hundred and fifty thousand dollars.

That the line will steal from the mountain, as such, its poetic character, is a groundless assertion; no one of the Righi's characteristic beauties will be cast in the shade, and the utmost it can do will be to bring together a busier throng. The croakers will soon have to hold their tongues, and all voices will cry a hearty welcome to the new undertaking.

THE DEATH-WATCH.

"DIDN'T you hear it?"

"When?"

"Just now."

"No."

"They say it foretells death. Hush!"

The two men sat motionless. Not a sound broke the silence, not even a creak of the old boards in the floor, or a sigh of the wind, or a flapping shutter.

"They say it foretells death. I heard it last night and the night before. What's that?"

"Nothing. It's stiller than a graveyard."

"I heard it last night and the night before about this time, near one. 'Tain't a very pleasant sound, and this old garret's dismal enough any way."

"Monk, you're afraid. It's nothing. Don't waste no more time. I'm dead-tired and sleepy. You wouldn't have been in this old hole now if it hadn't been for Peters."

"No, if it hadn't been for Peters, the strike, like enough, would have took. But he won't stand in nobody's way again."

While Monk spoke, he drew out a sharp, slender knife, and ran his finger along the blade.

"I tell you, Shiftet, we must do it the night after this blast's done, and the men in the shed say the coal will run out on the 6th, that's to-morrow. When Peters is fixed, the manager will have to give in or quit runnin' the furnace."

Both men sat with their arms leaning on the table, and the flickering light of the tallow-candle between them showed two faces, rough and begrimed by smoke and soot, and disfigured by evil passions, though grew fiercer as they calmly plotted against the life of a fellow-being.

"We'll meet at one, where the roads cross. It'll be quiet then, and Peters's house is alone."

"I'll be all right," said Shiftet, with a grin that rendered his brute-like countenance doubly repulsive. "I'm confounded tired. Bring your candle and light me down them infernal stairs."

The men stood up. Monk, small and slim, was dwarfed by the almost giant stature of his companion. With a few parting words as to secrecy and silence, they separated.

Monk stood on the upper step until Shiftet disappeared, then closed the door and replaced the candle on the table.

The room, neither large nor small, was a mere hole, smoked, dirty, and unplastered, high up in a frame tenement-house. Two or three chairs, an old chest of drawers, a rickety bedstead, and pine table, composed its furniture. Some old boots and broken pieces of pig-iron lay scattered about. The small, box-shaped window was set just below where the ceiling or roof sloped to the wall. The only door led directly to the stairs that went down two, three flights to the ground. There were many such places in Agatha, where the furnace-hands lived.

Monk walked rapidly up and down the room, as if making an effort to wear off the excitement that the last few moments had brought upon him. His features had lost much of the malignant expression, which was by no means habitual. His countenance was not hardened or stamped with the impress of crime like Shiftet's, who had just parted from him at the door—a countenance in which every trace of conscience had long ago been erased. Monk's face was neither good nor bad, neither bright nor dull; but he was a man easily wrought into a passion, governed by impulse.

Crossing to the table, he slung his coat over a chair, and stretched out his hand to extinguish the light. Midway in the action he suddenly checked himself, looked hurriedly around the room for an instant, and stood motionless, with inclined head, listening intently. Not a sound disturbed the stillness. Pinching out the light, he threw himself on the bed, and in the darkness there soon came the heavy, regular respiration of sleep.

The houses at Agatha nestled under the north cliff. A hundred feet above them the railroad lost itself in the black mouth of a tunnel and reappeared beyond, a high wall of trestlework stretching southward down the valley to Ely's Mines. Hours ago, the toiling men and cattle had lain down to rest, and now the wild, rocky hills around slept in the moonlight. No sound broke upon the stillness but the muffled puff, puff, of the furnace, and a murmur of frogs that rose and fell interruptedly along the shrunken water-course. The cabins under the cliff shone white and sharp; the iron on the metal-switch flashed with a million gems; the rails upon the trestle, receding, turned to silver, and the foliage of early summer glittered on the trees. A few passionless stars blinked feebly in the yellow light, where the hill-tops cut against the sky, and sank below the verge. Calmly, peacefully waned the night—calmly and peacefully, as though the spirit of evil had not stalked abroad plotting the death and ruin of men's bodies and souls.

That narrow spot of ground, with the houses down in the valley, formed the world for four hundred people. The furnace-hands and their families saw nothing beyond the hills and rocks that hemmed in their village; knew nothing of the mad tumults outside. An untaught, sturdy race of men, they differed little one from another. Every day, when the sun rose, they went forth to toil, and every night, when the great furnace over the creek glimmered red, they lay down to sleep. But ignorance and superstition filled their hearts, and anger, and hate, and jealousy, were as rife among them as in the crowded cities.

Another day passed, and the night which followed it was dark and cloudy. Near midnight, the great bell signalled for the last run of iron. Occasionally blue flames leaped up from the furnace, lurid as the fiery tongues of a volcano. The long and narrow roof brooded

over the sand-bed like the black wings of some monster bird hovering in the air. Under its shadow groups of men were but wavering, dusky figures. Suddenly, as an electric flash, a dazzling yellow glare broke out, and a fierce, scorching, withering blast swept from an opening that seemed the mouth of hell itself. Slowly out of the burning cavern a hissing stream of molten iron came creeping down. It crawled, and turned and crawled, rib after rib, until it lay like some huge skeleton stretched upon the ground. A thin vapor floated up in the sulphurous air and quivered with reflected splendor. The scarlet-shirted men looked weird in the unearthly brightness. The yellow glow faded to red, that deepened to a blood-colored spot in the night. The bell rang to discharge the hands, and squads of men broke up, scattering in the dark.

Monk went to his garret-room, hesitated a moment at the door, then passed in and shut it so violently that the floor shook. He struck a match. In the brimstone light a horrible demon countenance wavered, blue and ghastly; but, when the candle flamed, it grew into Monk's face, covered by the black scowl of rage that had disfigured it once before—a rage that was freshly roused.

"If I'd had my knife, I'd have done it just now, when I stumbled against him. But he dies to-morrow night at—"

The words froze on his lips, and his black, scowling face was suddenly overspread by a strange pallor. He stood motionless, as if chained to the floor, his eyes darted quickly about, and he seemed to suspend his very breath.

A clear, distinct, ticking sound occurred at regular intervals for a minute, and left profound silence.

Monk raised his head.

"It's a sign of coming death. That's for Peters. There it is again!"

The strange sound, like a faint metallic click, repeated itself several times.

"D—n it! I don't like to hear the thing. But there *will* be a sudden death."

Time after time Monk heard at intervals the same faint sound, like the ticking of a watch for a minute, and it made his blood run cold. He found himself listening to it with terror, and in the long silence, always straining his ears to catch it, always expecting, dreading its repetition, until the thing grew more horrible to him than a nightmare. Sometimes he would fall into a doze, and, waking with a start, hear it, while cold perspiration broke in drops on his forehead.

It grew intolerable. He swore he would find the thing and kill it, but it mocked him in his search. The sound seemed to come from the table, but when he stood beside the table it ticked so distinctly at the window that he thought he could put his finger on the spot; but when he tried to, it had changed again, and sounded at the head of his bed. Sometimes it seemed close at his right, and he turned only to hear it on the other side, then in front, then behind. Again and again he searched, and swore in his exasperation and disappointment.

The sound became exaggerated by his distempered imagination, till he trembled lest some one else should hear this omen which so plainly foretold his anticipated crime. Once an hour dragged by, and his unseen tormentor was silent. His eyes, that had glittered with deadly hatred, now wore a startled look, and wandered restlessly about the room.

An owl, that perched on the topmost branch of a high tree near by, screamed loud and long. A bat flew in at the open window, banged against the ceiling, and darted out.

Monk shivered. Leaning his head between his arms, he drummed nervously on the table with his fingers. Instantly the clear metallic click sounded again. He looked up, and a strange light broke into his face, a mixed expression of amazement and fright. For a moment he seemed stupefied, then raising his hand he tapped lightly against the wood with his finger-nail. The last tap had not died until it was answered by what seemed like a fainter repetition of itself.

Uttering a fearful oath, Monk recoiled from the table, but, as if drawn back and held by a weird fascination, he sat an hour striking the hard surface with his nails, and pausing for the response that each time came clear and distinct.

Gray streaks crept along the east, and quivered like a faded fringe bordering the black canopy. Still he sat tapping, but no answer

came. He waited, listened vainly; no echo, no sound, and the dull, hueless light of the cloudy morning glimmered at his window. Then he threw himself on his bed and fell into restless slumbers.

A damp thick fog enveloped the houses in its slimy embrace. At nightfall its reeking folds gathered themselves from the ground, and a noiseless drizzle came suddenly down.

Monk had not stirred from his room all day. The feverish sleep into which he had fallen fled from him before noon, and now he stood at his window looking out into the blackness. A clammy air blew against his face. He stretched out his hand and drew it back suddenly, as if he had touched the dead. It was cold and moist. He rubbed it violently against his clothes, as though he could not wipe off the dampness. A tremor seized upon him. Hark! was that the dripping of water? No. A sickly smile played over his countenance. He went to the table and tapped lightly with his fingers, as he had done before. In another moment the taps were answered, and he involuntarily counted as they came, one—two—three—four—five—six—seven—then all was silent. He made the call a second time, he tried it over and over, and at each response it ticked seven times, never more, never less, but seven times clearly, distinctly. Suddenly he sprang up, and through shut teeth hissed:

"The seventh day, by Heaven! But I'll cheat you—I'll not kill him!"

He darted noiselessly down the stairs, and struck out through the woods. In half an hour he emerged on the edge of a clearing, a dozen yards from a chopper's cabin. Creeping stealthily to the door he shook it, then after a moment's irresolution cried out:

"Peters! Peters! look out for Shiftet. He has sworn to murder you to-night."

Without waiting for a reply he sprang away, and was quickly lost among the trees.

A moment afterward a tall form arose out of the shadow of a stump near the cabin, and passed rapidly in an opposite direction.

At the summit of the hill east of Agatha, a steep precipice is formed by a great, bare, projecting rock. From the valley, its outline resembles an enormous face in profile, and they call it "The Devil's Head." The full moon rendered the unbroken mass of cloud translucent, producing a peculiarly sinister effect. The mist still blew through the air, but in the zenith there was a dull ashen hue, and the surrounding cloud was the color of earth. The far-off hills loomed up majestic, terrible, against the gloom; nearer objects were strangely magnified in the tawny light. At the foot of this phantom crag, on a terrace, is the ore-bank and blackened coal-shed. Below rose the metal-stack, from whose stone hearth a waste of sand sloped gently to the creek. The furnace squatted grim and black. Its blood-shot eye was shut; its gaping throat uttered no sigh, no groan; its throbbing pulse was stilled—the fierce, struggling monster was dead. The only bright spot in all the valley was the yellow circle made by the watchman's lantern in the coal-shed.

After leaving the "choppings," Monk threaded his way through the forest, coming out at last on the open road. This road led directly over the "Devil's Head," and entered the valley by a steep descent half a mile to the south. At the precipice Monk paused. The wind eddied with a mournful wail, and the constant motion of tall trees gave the scene almost the wavering, unsubstantial appearance of a vision. There was something oppressive in this strange midnight twilight, but Monk did not feel it. He only felt relief, inexpressible relief; he only stopped there to breathe, to breathe freely once more with the heavy weight thrown from him. After a moment he ran carelessly down the hill, passed under the ore-cars and into the coal-shed. He hailed Patterson, the watchman, and the lantern threw gigantic shadows of the two men over the ground. Then he walked along the narrow cinder-road leading to the bridge over the creek. Sometimes the willows, that grew on either side, swept their damp hair against his face. An hour ago he would have started convulsively, now he heeded not, for he was free and light of heart.

Monk reached the stairs, and ascended to his room. As he passed in, the powerful figure of Shiftet sprang upon him from behind. There was a scuffle, some muttered oaths, then a heavy fall. Monk lay stretched upon the floor motionless, lifeless, and the echo of fleeing steps died away, leaving the place still as the now silent *death-watch*.

FLORENCE McLANDBURGH.

SONNET

TO THE AUTHORESS OF "VALERIE AYLMER."

FLUSHED in the blended dawn of youth and art
 Thou stand'st, sweet Priestess! their fresh splendors spread,
 Half halo-wise, around thy radiant head,
 And all their soft enchantments in thy heart;
 Heaven grant thee grace to bear thy glorious part
 In the brave toils to which thy soul is wed;
 May all thy wingèd fancies, nobly sped,
 Like birds of happy omen, range the mart,
 And wild alike, to find their favored rest,
 (Laden with olive-leaves, and sprays of love),
 In many a troubled home and anguished breast;
 And ever may thy mind's aspiring aim
 Glance sunward, fixed on shining goals, above
 The transient glowworm lights of mortal fame!

A VISIT TO ALEXANDRE DUMAS.

FROM THE GERMAN OF GUSTAV RASCH.

IT was a beautiful, clear winter's day, in the month of February, 1870. The sky was cloudless, and the sun shone forth in all its splendor, but imparted little warmth to the cold and bracing air. It was one of those February days that seemed to have halted on its journey, and, amid surroundings of snow and ice, to remind us that we were on the verge of spring.

I was seated in a handsomely-furnished apartment at the Hôtel de Bavière in Paris. Carlotta Deckner had just finished playing Ernst's "Elegy." She had rendered this exquisite *morceau* in truly splendid style, and was still holding her magnificent cremona in her hand. She cast her beautiful dark eyes first at her violin; then, laying it aside, she looked at me inquiringly. I understood the expression of those eyes, and said:

"Miss Carlotta, your artistic and delicate play has made a deep impression upon my mind. I am enraptured and carried away by the spell of your marvellous execution, so that even now the sweet and dulcet melody of Ernst's immortal masterpiece sounds in my ear. I can only say that you have rendered it in an exquisite and delightful manner. I hope you will play the 'Elegy' when you give your next concert."

Carlotta answered:

"Certainly; I shall play the 'Elegy' on that occasion. I intend to commence the second part of my programme with this *pièce de résistance*. But what do you say—suppose we pay our proposed visit to Alexandre Dumas to-day? My concert will take place day after tomorrow. I will invite him. Didn't you say, the other day, that you would like to make the acquaintance of the author of 'Le Comte de Monte Cristo?' I called on him about a week ago, in company with my sister Stéphanie; he received us with great cordiality and kindness. I want him to write a line in my album. His daughter is charming. We shall find her at home about this time."

"I am very much pleased with your proposition, Miss Carlotta," I replied. "Let us start as soon as possible. *A propos*, I must not forget to fulfil a promise which I made to Louisa Mühlbach. She requested me to give her best respects to the famous French author, if I should succeed in having an interview with him. And, then, the sun shines so bright to-day. It is not often that the inhabitants of Paris are favored with such a splendid day as this in the month of February."

I rang the bell, and ordered a carriage. It is a considerable distance from the Rue de Conservatoire to the Boulevard Malesherbes. In the course of half an hour we alighted in front of a large four-story house, situated on the Boulevard Malesherbes, not far from the Parc Monceau. We ascended a broad marble staircase, until we had reached the fourth floor. Upon ringing the bell, an elderly female came to the door. She took our cards, and went back into the room. In the course of a few minutes, she returned with an invitation to come in. We entered a spacious apartment. A library-table stood on the right of the

door, near one of the windows. At this table sat a middle-sized gentleman of powerful frame and olive complexion. His eyes were as black as jet. His hair, which had once been of the same color, was quite white, short, curly, and standing up, as if its owner often ran his fingers through it. He turned around as we entered, and, when his eyes fell on Carlotta—who, as I have already mentioned, had once before called on him, together with her sister—he rose from his seat. Smiling and putting out his hand, he advanced and welcomed us in a very hearty manner.

Alexandre Dumas was born at Villers-Cotterets, on the 24th of July, 1803; at the time of our visit he was, consequently, sixty-seven years of age. His father was Alexandre Davy Dumas (de la Pailleterie), a French general, born in Jérémie, Hayti, on the 25th of March, 1762. He was the son of a wealthy planter, the Marquis Antoine Davy de la Pailleterie, by an African negro-girl named Tinette Dumas. It is said that the Marquis de la Pailleterie for several years held the position of Governor of St. Domingo. But he soon returned to France, taking his son with him. At the age of fourteen, the boy entered the French army, and enlisted, under his mother's name of Dumas, as a private in a cavalry-regiment. He made himself known by his vivacious temper, handsome figure, and prodigious strength, being able, it is said, to strangle a horse between his knees; but this did not much improve his condition, as at the age of sixteen years he was merely a non-commissioned officer. But, while serving under Dumouriez, he performed several daring acts, distinguishing himself by great personal courage in all the engagements in which he participated, and soon displayed soldierly abilities which pointed him out for promotion. He rapidly passed through every rank, until, in September, 1798, he was appointed general of division. In 1796 and 1797 he served in Italy under Bonaparte, and was especially employed in the Tyrol, where, at the battle of Brixen, he alone defended a bridge against the enemy, giving the French time to come to the rescue, in consequence of which Bonaparte presented him to the Directory as "the Horatius Coclès of the Tyrol." He served with no less distinction in Egypt; but upon some disagreement with Berthier he departed for France. The ship on board of which he had embarked being obliged to put into Taranto, he was arrested by the Neapolitan government, and detained for two years. After his release, the first consul declined to give him an appointment, on account of his republican opinions. He retired to Villers-Cotterets, a small town, where he had married. Here he remained in private life until his death, which took place on the 26th of February, 1806. He died of consumption, in a state bordering on destitution.

The son of this General Dumas, and grandson of the Marquis de la Pailleterie and of the negro-girl Tinette Dumas, is the famous author of "Le Comte de Monte-Cristo."

Carlotta introduced me to him; he extended to me a very cordial welcome. At a small desk, which stood in a corner on the farther end of the room, and which was covered with books, manuscripts, and papers, sat the private secretary of Dumas, a handsome young man, with mustache and goatee, leisurely writing. Upon seeing us enter, he too got up from his seat, and, pushing two commodious arm-chairs in front of the fire which was burning in a grate, politely requested us to be seated. He then resumed his work. Dumas remained standing, with his right arm leaning on the mantel-piece.

The apartment presented a very comfortable appearance; it was papered with a delicately-tinted paper, and its deeply-recessed windows looked out upon the boulevard. They were draped with some soft-textured blue material. Besides the library-table and the secretary's writing-desk, the furniture of the room consisted of half a dozen chairs, a handsomely-carved oaken table, which stood in the middle of the apartment, and a very large bedstead, covered with a fine quilt. This latter piece of furniture took up considerable room. The walls were hung with a number of pictures; there were some really fine oil-paintings among them. The most prominent one, which attracted my attention, was the life-size portrait of a middle-aged man. "My son," said Alexandre Dumas, smiling, when he noticed that this picture, of all others, interested me. He at the same time cast a look at it, full of the most tender love. "He is not at all fond of handsome women," he then added, turning to Carlotta. It was in vain that I tried to find an ironical expression in his countenance, as he uttered these words. The only expression which his olive-complexioned smiling features wore, as he looked at his son's portrait, was one of tenderness and fatherly love.

Alexandre Dumas, though the son of a white woman, presented all

the characteristics of the mulatto. Indeed, it is said that he showed his descent from the negro race even more strongly than his father did.

His dress, on the occasion of our visit, was somewhat showy and grotesque. It consisted of a pair of wide linen trousers, a pair of shoes made of green leather, and a short coat of dark-blue velvet, cut in the shape of a blouse. It was unbuttoned, and displayed an expanse of shirt-front between a pair of heavy shoulders. His powerful, muscular neck was bare, with the exception of a silken tie which he wore under a shirt-collar of immaculate whiteness.

"I am pretty sure you do not know where I saw you for the first time, M. Dumas," I said, as we were comfortably seated before the blazing fire. "It was nearly ten years ago, at Naples, at the entrance of the Cabinetto Reservato in the Museo Borbonico, which you had caused to be opened. I accompanied the captain who entered with you."

"Ah, yes, I remember! A military officer, a gentleman in citizen's dress, and several soldiers, entered together with the masons, to whom I had given directions to break open the door. So you were the gentleman in citizen's dress?"

"It was I. But there is still another city besides Naples which both you and I have visited, though not at the same time," I said—"Marseilles. I, of course, went to see that horrible prison, Castle If, which has been rendered famous by your work 'Le Comte de Monte Cristo.' The old wife of the castellan—I suppose you recollect her—conducted me to the cells of Abbé Faria and of Edmond Dantes, after she had shown me the dungeon of the Duke of Orleans and that of the Man with the Iron Mask."

Alexandre Dumas smiled.

"Abbé Faria and Edmond Dantes have never existed, except in my imagination," he said; "they are both fictitious persons. So the castellan's wife spoke of them to you as of two persons who had in reality been incarcerated in Castle If? That is strange, very strange, indeed!"

"Certainly she did. But I must beg your pardon for what I am going to say. Edmond Dantes and Abbé Faria have been imprisoned in Castle If, the former during the space of twelve years, while Faria spent fourteen years in his horrible dungeon, where he died, having become a maniac. It is said that he was an Italian conspirator. Edmond Dantes was released after having been incarcerated for twelve long years. He had been accused of sympathizing with the Bonapartists. Both prisoners were never granted a trial; they were never brought before a tribunal. The two unfortunate men were arrested at the instance of the King of France, and were by him imprisoned in Castle If."

Alexandre Dumas looked at me with an expression of countenance which it is not quite easy to describe. The glance of his eyes seemed to indicate his impression that he was confronting a person who, with the greatest possible nonchalance, tells an incredible story, with the expectation that his gullible hearers will accept as true all he says. After the lapse of a few moments, Dumas exclaimed: "I tell you, Edmond Dantes and Abbé Faria never existed in reality; I have invented both *caractères*."

"You are mistaken, M. Dumas," I answered. "Both prisoners are historical personages, of whom you have made use for the better illustration of your work. The Count of Monte Cristo, I admit, is an invention of your *fantaisie*, the product of your imagination; but Captain Edmond Dantes is an historical personage, and so is Abbé Faria."

Our conversation had, indeed, entered upon an interesting phase. When, full twenty years ago, in silent rapture, I perused one of the most famous works of the celebrated French author, I little thought that, at some future day, I was to carry on an animated discussion with him as to whether two of his most celebrated characters were truth or fiction. In support of my side of the question, I simply cited historical facts; still, I did not succeed in convincing Dumas that he was in the wrong, although I assured him that he might accept my information as historically reliable. He remained firm in his assertion that he had been "the original inventor" of the two characters in question. Entirely ignoring whatever arguments I had advanced in order to convince him that he was mistaken, he at last said: "I will now prove to you beyond a doubt that I invented both Abbé Faria and Edmond Dantes. Listen! When my work 'Le Comte de Monte Cristo' was first published, it created quite a sensation in France, whereupon

the city of Marseilles offered to make me a present of the house in which Mercedes had lived. All endeavors, however, to find this house were in vain; its location could not be ascertained. I informed the commune of Marseilles that Mercedes was a fictitious person, who had been in existence only in my *imagination*; and that, consequently, the city of Marseilles might save itself all further trouble in trying to find the house. Are you convinced?"

"Not at all! I am perfectly willing to admit that Mercedes has had her existence exclusively in your imagination. As to Edmond Dantes and Abbé Faria, however, I still maintain that both are historical personages. In order to write an article about Marseilles and Castle If, I some time ago made minute researches into the history of the epoch to which you refer in 'Le Comte de Monte Cristo;' and I can assure you that I have found ample proof in support of my assertion, viz., that both Edmond Dantes and Abbé Faria have been inmates of Castle If. The *historical* records which I have examined furnish sufficient evidence of this end."

Our dispute could not be brought to a final decision, there being no historian present to act as umpire. We therefore changed the subject of our conversation. Carlotta invited Dumas to attend her concert, at the same time laying two tickets on the table. He returned thanks in the most complimentary terms for her kindness, adding, however, that he should not be able to come in person. While expressing his regret at his inability to be present on that occasion, he stated that he never went out, but he would give the tickets to his daughter, who would with much pleasure attend the concert in his place.

"Do you know my daughter?" he continued, addressing this question to me. Upon my informing him that I had not the pleasure of the lady's acquaintance, he said to his secretary: "Henri, please call my daughter!" He then added: "Of course, you must make the acquaintance of my daughter!"

While the secretary was gone, Carlotta asked, very much astonished: "Did I understand you to say that you never go out, M. Dumas? Why not?"

"I don't feel like climbing up and down eighty-six steps every time I want to go into the street. I am an old man. My son—" he again cast a look full of fatherly love and tenderness at the before-mentioned life-size portrait of the author of "Camille"—comes to see me quite often, and asks me to go out with him; but I invariably refuse to comply with his request."

"But do you never go to the theatre?" Carlotta continued. "Do you never go to see a new piece?"

"No; I don't care for that. I myself have written too much for the stage, and I feel no desire to attend any more theatrical performances."

"And do you never go to the opera?"

"No; I have heard plenty of music in my lifetime."

Here the secretary returned and informed us that *madame* would make her appearance in the course of a few minutes. Carlotta requested the author of "Le Comte de Monte Cristo" to favor her with his autograph for her album. He readily consented, and, asking the secretary for pen and ink, and calling Carlotta *mon bijou*, he wrote a few lines on a leaf of the album. She asked for another autograph, which she wanted to give to a lady friend in Germany. Dumas also complied with this request. I then spoke to him about Louisa Mühlbach, the celebrated German novelist. He said that he had quite recently read an article about the German authoress in the *Revue des Deux Mondes*. He requested me to return his compliments to her without fail. I then asked him what work he was engaged on. He replied that he was occupied on his new novel, entitled "Création et Rédemption," which at that time was being published in the *feuilleton* of the *Siècle*. He added that he considered this novel one of his best productions; then, turning to Carlotta, he spoke to her about Pesth, which place he had visited in order to superintend the performances of some of his dramas at the "Hungarian Theatre" in that city.

It is not generally known that Dumas was married; such was the case, however. He was united in marriage in 1842 to Mlle. Ida Ferrier, an actress of the "Porte St. Martin."

Our conversation was suddenly interrupted by the entrance of a lady. Her figure was tall and slender, while her features were regular and handsome. Her luxuriant dark-brown hair shaded her smooth brow, and her dark eyes were large and luminous. I could not doubt for a moment who this lady was. Carlotta rose and was welcomed by her in the most cordial manner. Alexandre Dumas, addressing me,

then said, "My daughter!" He caught hold of her hand and looked at her with a kind and tender expression of countenance.

She took a seat near the fireplace, and promised Carlotta that she would come to the concert. Our conversation then turned on different subjects; we spoke about the unusually fine winter weather, music, the drama, etc. At last Carlotta said to me: "I suppose you are not aware that M. Dumas's daughter is quite an *artiste*?" Then, addressing that lady, she added: "Will you not be so kind as to show this gentleman those pictures from 'Faust' in the *salon*?" Dumas's daughter at once consented, and requested me to step into an adjoining room. We all rose; Carlotta and I took our leave of Alexandre Dumas. He pressed his lips upon Carlotta's hand and handed her a letter of introduction, which, during our conversation with his daughter, he had caused to be addressed by his secretary to one of his *confrères*, requesting him to write an editorial notice of Carlotta's concert in one of the principal daily papers.

The only daughter of Alexandre Dumas had been married to a Spaniard. She obtained a divorce from him several years ago. Since that time she has lived with her father, superintending his household affairs. After the separation from her husband had taken place, she again assumed the celebrated name of her father. At the time of our visit to Alexandre Dumas, he was once more in reduced circumstances. Strictly speaking, his financial affairs have *always* been deranged, notwithstanding the very large income which he has enjoyed through the production of an enormous number of novels and dramas. No other European author has ever been in receipt of any thing like a similar revenue. Money, however, possesses no value in Dumas's eyes. He was brought up at Villers-Cotterets, in which place he remained till he attained his nineteenth year, when the pressure of family difficulties sent him to Paris. After his father's death, he was left to the care of his mother, who left him entirely to his own guidance. She sent him, indeed, to school; but the boy was very irregular in his attendance, learned very little French, and less Latin, but became a good horseman, billiard-player, fencer, and shot. At the age of fifteen he was placed as copying clerk with a notary, by whom he was employed for several years.

At that time there resided at Villers-Cotterets a family by the name of De Leuven, which had left Paris in 1815, an eventful year, which brought about vast changes in that city. A member of this family, Adolphe de Leuven, was possessed of some little dramatic talent, and employed his leisure hours in writing *vaudevilles*. He encouraged young Dumas to try his luck in the same line. Together they now wrote three plays; but, unfortunately, these productions were returned to them by the managers of the different theatres in Paris. But Alexandre Dumas did not lose courage. He went to Paris, in order to seek his fortune, arriving in that city with only a few *louis d'or* in his pocket. He took lodgings in a garret on the fourth floor of a house fronting the Place des Italiens. Being personally without influential friends, and as poor as a church-mouse, it was up-hill work with him. He experienced all the hardships of the young scribbler's fate. At last an idea struck him. He applied to his father's friends to obtain employment for him. Marshal Jourdan, Marshal Sebastiani, and the Duke de Belluno, were among this number. He visited them all; but the reception he met with at their hands was not very encouraging. After several disappointments, he was befriended by General Foy, who procured for him a small office in the household of Louis Philippe, then Duke of Orleans. His salary amounted to twelve hundred francs per year, "in consideration of his excellent penmanship." This sum was a fortune to the young man.

"For the present I shall live by my penmanship, general," he said to General Foy; "but I promise you that one day I shall live by my pen alone!"

Alexandre Dumas kept his promise. There never lived another author who squandered as much money as he did, after first earning it by strokes of his pen. His son—Alexandre Dumas fils, as he is generally called—makes up for the old gentleman's extravagance. The author of "*La Dame aux Camélias*" is said to be very saving. A French writer says: "Dumas fils presents a striking contrast to his father; instead of imprudently lavishing his wit and money, he uses both with a sparing hand."

Still, Alexandre Dumas's success was not established quite so soon as he had expected. Like all other men of genius who have won their way to fame and fortune by strokes of the pen, Dumas had to toil and achieve greatness step by step. It was, as I have said, a rough road

for him; but he spurned all obstacles, until he commenced that career which he followed with such persistency and indomitable pluck that success—a great success—at last crowned his efforts. Since then, how many bright scintillations have burned and dropped from his almost magic pen! For freshness and conciseness of dialogue, he has had but few equals.

But, to return to the period when Dumas first arrived in Paris. A play written by him and his friend in Villers-Cotterets shared the fate of their former dramatic efforts. They could not get it placed on the stage even by managers of the minor theatres. Yet Dumas struggled on through many and hard privations, and suffered all the well-known trials of young authors. He wrote another play, and for this succeeded in finding a purchaser. He received for it the sum of four francs. His next effort yielded him six francs. Then followed two dramas, which, being considered failures by the managers to whom they had been sent, were never brought out. Dumas now wrote his tragedy "*Christine*," or "*Stockholm, Fontainebleau et Rome*," and through this effort became a *protégé* of Charles Nodier. The latter induced Baron Taylor, at that time "royal commissary" of the Théâtre Français, to accept Dumas's tragedy, in order to have it produced at this establishment. But here another misfortune befell the young author. Baron Taylor made a tour to Egypt, and his secretary refused to place Dumas's tragedy upon the stage of the Théâtre Français in his absence. Dumas was almost beside himself. At last the contending parties agreed that they would leave the decision to Picard.

"Do you possess means?" he asked Dumas.

"Not one sou."

"Well, how do you manage to live?"

"I hold a situation which yields me a yearly salary of twelve hundred francs."

"My young friend," said Picard, "I advise you to keep your situation, and to attend well to your duties. That is far more sensible than writing for the stage."

This cruel advice was truly disheartening. But Dumas was not to be discouraged in this manner. He at once set to work and wrote an historical play, entitled "*Henri III et sa Cour*." With the aid of the Duke of Orleans, who in the mean time had procured for him the comfortable position of librarian in the library of the Palais Royal, which was quite a change for the better, when compared with his old situation in the duke's household, he at last succeeded in having this drama placed upon the stage of the Théâtre Français. It was brought out in 1828, and, although constructed with utter disregard of the ordinary rules, it was well received, and created a lively sensation. It was vigorously assailed by the critics; but it was enthusiastically applauded by the public. The young author realized from this drama no less than thirty thousand francs in a few months. His tragedy "*Christine*," or "*Stockholm, Fontainebleau et Rome*," which was brought out at the Odéon in 1830, also met with decided success; and new pieces from his fertile pen appeared in rapid succession, which, while eliciting severe criticism, drew crowded houses. Dumas was now unquestionably the first among the French dramatists. His star had risen above the dramatic firmament of France; it rose still higher from year to year. Dumas was soon in the very zenith of his triumph, and thus found himself in the possession of fame and fortune. He was *fêted*, flattered, and caressed beyond measure, and had no reason to be sorry that he had embraced writing for the stage as a profession. It is almost incredible what large sums of money he received for his literary productions; for soon he did not confine himself to writing for the stage alone. As a dramatic writer he was remarkable for the aptitude he displayed in writing on all subjects, and for the originality of his ideas.

In the mean time, however, the stage, as I have said, had already begun to prove too small a field for his talent and ambition. His active mind aimed at still higher pursuits. The success with which his dramatic efforts had been attended first induced Dumas to entertain the idea of entering the field of novel-writing, and with the boldness of true genius he ventured to write several works of this character. The result is well known. He began with "*Isabelle de Bavière*," a romantic picture of France in the fifteenth century. The public soon found that the stirring dramatist was a still more enticing story-teller. Dumas himself had not been aware how great a talent he possessed for story-telling. Some of his novels have had a larger circulation than any other productions of this description. Their success has been marvellous. It is not too much to say that they have caused a com-

plete revolution in French novel-writing. They are remarkable for their dramatic interest, and, notwithstanding the faults incident to his writing so much and so fast, his books enjoy a popularity, even in other languages, such as few can boast. It is probable that literary labor never before brought a man so large a fortune. In skillfulness of arrangement, vivacity and sustained interest of narrative, and inventive faculty, no living French author rivals him; but it cannot be denied that most of his writings pander to a morbid love of the extravagant, eccentric, melodramatic, and frivolous, and tend rather to amuse and dazzle the fancy than to produce any abiding influence upon the mind of the reader. From the time when "*Le Comte de Monte Cristo*" was first published to the present day, there have been, probably, over half a million copies sold in France alone. Before the appearance of this work, Dumas's name had been but little mentioned outside of France. It is well known that this novel made a prodigious sensation, and that Dumas soon acquired world-wide celebrity as its author. Probably no literary work, published in Europe or America, ever won so much attention as this. Dumas has written plenty of other novels; but none of them became so famous as "*Le Comte de Monte Cristo*." This production has been called a *chef-d'œuvre* even by Dumas's enemies, and as such it will remain forever a monument of the literary abilities and genius of the author.

The English translations of Dumas's principal novels have attained an immense circulation in the United States.

The time had indeed come to which the poor employé in the household of the Duke of Orleans had alluded, when, addressing General Foy in prophetic language, he confidently asserted: "*Je vais vivre de mon écriture; mais je vous promets de vivre un jour de ma plume!*"

Unfortunately, Dumas turned out to be a great spendthrift; he squandered millions upon travels, villas, horses, equipages, presents, dinners, and suppers. Previous to 1848 he had undertaken, near Saint-Germain, the building of a small but fantastic and costly country-seat, which became celebrated under the name of *Château de Monte Cristo*. The Revolution cutting short his means, the *château*, upon which he had already expended four hundred and fifty thousand francs, was offered at auction in 1854, and sold for less than a tenth of its original cost.

One day, Dumas paid a visit to one of his numerous friends. When taking his leave, he said: "I have left my pocket-book at home. Please let me have twenty louis d'or." His friend handed him the money. Dumas gave these twenty louis d'or to the servant who helped him to put on his overcoat. He then entered his *fiacre* and drove away. In the course of an hour he brought up before the house of another friend. He was about to pay the driver; on putting his hand in his pocket, however, he noticed that he had no money. He entered the house, borrowed ten louis d'or from his friend, went to the door, made the driver of the *fiacre* a present of the ten louis d'or, and then took a long walk on the boulevards. There are hundreds of anecdotes of this character regarding Alexandre Dumas in circulation in Paris. When Isabella, the lately-exiled Queen of Spain, at the age of only fifteen years mounted the Spanish throne through the intrigues of the *moderados*, who wished to keep the reins of government in their hands, Dumas succeeded in being sent to Madrid in some official capacity. Upon his arrival at the Spanish capital, he immediately assumed the title of his grandfather, Marquis de la Pailletterie; and by the most lavish and extravagant expenditure of money, as well as by the display of great pomp and show on the occasion of the young queen's coronation, he attracted much attention, and entirely threw into the shade the ambassadors of all the European monarchs. One day he attended a bull-fight, and at the end of the performance threw to the *matador*, who had killed the last bull, a cigar-case, richly inlaid with pearls and diamonds, representing in all the sum of *thirty thousand francs!* Is it to be wondered at that, under these circumstances, of all the money that the French reading public and French play-goers for years and years have been putting in his pockets, not a single franc has been left? Only a short time before I called on Dumas at his residence on the Boulevard Malesherbes, up four flights of stairs, his creditors had once more found themselves compelled to hold a meeting, on which occasion a committee was appointed, upon which devolved the duty to take in hand the management of his financial affairs. This committee took charge of whatever income Dumas was still in receipt of from publishers and stage-managers. Out of this revenue it paid part of his debts, giving, however, to his daughter sufficient money for the defrayal of all necessary household expenses.

The saloon, to which Dumas's daughter escorted Carlotta and myself, was neither very spacious nor handsome. Its furniture was of a very plain description. The walls were adorned with pictures, painted by herself and representing scenes from "*Faust*;" they were not unimportant in merit. It was quite chilly in the saloon; no fire burnt in the grate of the large fireplace. Marie Dumas noticed that Carlotta and I felt uncomfortably cold. "Come into my room, it is too cold here," she said, when I had finished my examination of *Faust*, *Gretchen*, and *Mephistopheles*. Her apartment was small, but every thing about it wore a cheerful look. It was neatly furnished, with due regard to taste and comfort. Before the window, which looked out on a little grass-plot in the rear of the house, stood a few choice exotics. The floor was covered with a handsome, heavy Brussels carpet. An upright piano stood near the window, while a very well-executed portrait of Alexandre Dumas hung over the mantel-piece. We sat down before a cheery fire and spent another hour in pleasant conversation on different subjects. Marie Dumas spoke quite enthusiastically of Spain, she having accompanied her father on a pleasure-tour through that country. Carlotta and I then took our leave, after having received an urgent invitation to call again at an early day.

A few days after my visit to Dumas, I met in the garden of the Tuileries an *attaché* of the Prussian legation at Paris with whom I was well acquainted. I told him of my visit. "What is that?" he exclaimed, laughing; "has Dumas really told you that he never leaves his room, that he never goes to a theatre, and that he never attends a concert? Why, I met him on the Boulevard des Italiens only a few days ago. He very frequently goes to the theatre, for he is entirely too vain to forego the personal gratification of showing himself in public from time to time. He always occupies a seat in one of the proscenium boxes. Did you say he spoke with paternal affection regarding his son? I assure you that father and son have no intercourse whatever. It is very seldom, indeed, that they meet one another. His love for his daughter, however, is real; and she fully deserves her father's affection; she is an estimable lady, of charming, benevolent temper, and her good-nature, attractive presence, and pleasant manners, have won for her the hearts of those who have the good fortune of being acquainted with her. But I do not mean to say that Dumas has intentionally told you that batch of lies. His *fantaisie* often carries him beyond the bounds of veracity. His imaginative power is of a tremendous order. I am candidly of the opinion that he made to you those communications in perfect good faith, and that, for the time being, he really believed to be true all that he told you. Maybe that, when you called on him, he was just engaged on the composition of a new novel; depicting the miseries of some unfortunate invalid, who is confined to his room and prevented from going to the theatre or from attending a concert. Or, perhaps, he was just describing the parental affection of a loving, tender-hearted father, and his boundless imagination so worked upon his mind that he fancied himself to be the invalid or the tender-hearted parent. We can take a stroll to the Boulevard Malesherbes some day next week if you should feel inclined to do so, and we can then pay another visit to Dumas and his daughter. I am well acquainted with both of them."

Unfortunately, I was prevented from making this proposed visit in company with my friend. I left Paris without having seen Alexandre Dumas a second time. I thus had no opportunity to come to a final understanding with the celebrated author of "*Le Comte de Monte Cristo*" regarding our dispute—whether Edmond Dantes and Abbé Faria have been human beings of flesh and blood, or whether they existed only in the author's tremendous imagination.

Alexandre Dumas died at Dieppe on the 9th of December, 1870, having attained not quite his sixty-eighth year when his summons came. Few men have written so industriously and successfully as he for the past forty-five years, and none so well in what must be called his *spécialité*—the historical French drama and novel—of which he must be regarded as the founder. Such was the confidence of Dumas in the fertility of his imagination that, in 1846, he made a contract to furnish two newspapers with an amount of manuscript equal to sixty volumes a year; and this exclusive of his plays and other occasional productions. Such abnormal fecundity raised the question whether he was really the author of the books bearing his name. A lawsuit, in 1847, with the directors of the *Presse* and *Constitutionnel* brought to light the fact that he had engaged to furnish those journals with more volumes than a rapid writer could even copy.

SKETCHES WITH PEN AND PENCIL.—NO. 1.

By F. O. C. DARLEY.

ITALIAN SCENES.

THERE certainly is no country in the world more fitted to charm the eye of every lover of the picturesque, than beautiful Italy. Forlorn as are most of the towns and villages through which you pass, afflicted with any amount of dirt, and every variety of odor, they never fail to supply the artist with endless subjects for his portfolio; though so animated is the whole scene, so full of life, so continually changing, that no sooner has he put pencil to paper—than—"Presto, change!" the whole thing becomes a dissolving view, group after group rapidly succeeding each other like the motley figures in a magic-lantern. The tortuous streets turning and twisting right and left, are ill-paved, have no sidewalks, and are so narrow as to admit only a

grave of aspect, with the scholar's pallid complexion, and absorbed, apparently, in the study of some holy book, on which his keen, dark eyes are reverently bent. Many, however, are not quite so ascetic in appearance, often bearing beneath their long robes aldermanic proportions, that "shake when they laugh, like a bowl full of jelly," and you cannot help thinking, as you look at the broad, humorous face, and observe the fat fingers that protrude from the sleeve to make the sign of the cross, while passing one of the street-shrines, how well the good Italians feed their saints.

One can hardly call the street-shrines picturesque, with their poor Madonnas almost smothered in garlands, crowns, and flowers—sometimes there is only a wretched daub under a glass case, exposing a

RETURNING FROM THE COUNTRY FAIR.

glimpse of clear blue sky between the unwholesome-looking houses, sending down here and there a bright ray of light upon the countless crowds that swarm below. Among them what capital groups, lounging about in every variety of easy attitude! There seems to be an innate sense of beauty in these extraordinary tatterdemalions, who carry their weather-beaten drapery in a fashion that would not ill become the noblest signor, and you doubt, as you observe their extreme loftiness of bearing and perfect unconcern, whether they would be willing to exchange positions with Victor Emmanuel himself. The very beggar that clings to your carriage-wheels thanks you for the trifle you throw him with an ease and grace that almost makes you feel ashamed of your very limited charity. The unfortunate donkey never fails to make his appearance, staggering along under a pile of firewood, and with huge panniers crammed with fruit, vegetables, and poultry; his driver sprawling above all, face down, like a frog sunning himself on the surface of a pond. No Italian street would be complete without the monk; there, you are sure to see him pacing quietly along, with his cowl thrown back from his shaven crown, and the ample folds of his brown frock falling to his stockingless, sandalled feet; sometimes

blood-dropping heart, pierced with many daggers, like a cushion stuck full of pins. The little stone wayside shrine, often moss-stained and wreathed with vines, its red-tiled roof protecting from the weather the carved, unadorned figure beneath, is a much more interesting object. I remember, on one of my sketching expeditions, being quite charmed with the capital effect of a peasant at his devotions in front of one of these. His goat-skin breeches, his leggins bound with leathern thongs, his tattered blue cloak, his really fine head with flowing hair and beard, were quite striking, and you could scarcely doubt his sincerity as you saw him bending with closed eyes and telling his beads before the rude object of his devotion.

Another character, almost as familiar to the eye of the traveller as the monk, is the goat-milker, followed by his hirsute family of "milky mothers;" his shaggy head, and wild, black eyes generally set off by the conical hat, with, perhaps, a feather or two stuck in the bright-colored band. He seems to be the best-natured fellow in the world, has a good word and a pleasant smile for each of his customers, gossiping with the old women and young girls who gather about him to receive his milky treasures, while his four-footed friends lie huddled

together in the sun, contentedly nibbling at the stray leaves of vegetables with which the streets are plentifully garnished.

Nothing could furnish scenes more full of life, character, animation, and amusement, than are to be met with in the crowds returning from the country fairs. On such occasions the road seems to be literally covered with moving, jostling, laughing groups; each girl bestriding her donkey like the man who sits behind her with his arms around her waist; she, in a shawl of some gaudy color and staring pattern, and he with a scarlet vest, and a huge bunch of glass flowers in his hat, luxuries no doubt the result of their visit to the fair. Sturdy young fellows go trotting along on foot; one I saw dexterously balancing half a dozen hats upon his head, one within the other, like a nest of flower-pots; another curiously encumbered with a lively young pig, which he carried about his neck, manfully resisting its vigorous tugs, and answering its imploring cries with shouts of uproarious laughter.

The braying of donkeys, the jingling of bells, the squeaking of penny trumpets, the shrill laughter of women, and rough jests of the men, as, by rapid gesticulation with the fingers they convey to each other the events or business of the day, make altogether a scene of uproar, dust, and confusion, not easy to describe.

It seems quite remarkable that, of the numberless female faces that meet the eye in all these animated crowds, scarcely one can be said to have any claim to beauty. In fact, as far as my observation went, this seems to be the case among all the Italian women of the lower classes; their features are not regular, and their complexions, even among young girls, are sallow, with no warmth of color in the cheek. They very often, however, have wonderfully fine eyes, and a certain vivacity and grace of manner, which, if combined with a liberal use of soap and water, would make them quite charming. The old women—and they are very old at forty—are simply hideous; their mahogany-colored faces hashed with a thousand wrinkles, looking not unlike a muddy, wheel-furrowed road. I remember being particularly struck with one of these antique dames on the road to Rome.

There was nothing effeminate about her but her dress; she was as dark as one of our Indian women, her features bold, masculine, and repulsively ugly; her small, bead-like eyes almost lost under her griz-

zled brows, and her wrinkled lips coming together, like a tightly-drawn purse, over two discolored fang-like teeth. With one hand she led a cow by a rope, to drink from a little stream that ran sparkling under

an arch, while the other held her distaff and spindle. The gay colors of her dress, the scarlet handkerchief about her head, her blue bodice, with the gray stone bridge and purple hills beyond, in spite of the hideousness of the poor old woman, made a most admirable "bit" for the pencil.

Never shall I cease to remember my three-days' sojourn at the lovely town of Sorrento, beautifully situated on high cliffs which overlook the glorious bay of Naples. There are whole gardens of olives and oranges—the latter filling the air with their delicious perfume, and, although it was early in the month of February, both flowers and fruit were thick upon the trees. Our hotel stood in the midst of foliage loaded with golden balls, and silvery with fragrant blossoms; a Persian garden is not more full of roses. It was exquisite pleasure to lean from the balconied window, and, while inhaling their delightful perfume, gaze with a feeling of perfect rapture on the magnificent view that lay before me. The cloudless sky, the dazzling, glittering sea, reflecting a thousand tints; its restless waves of blue, and gold, and bronze, lying in the warm embrace of the purple mountains—gray old Vesuvius crowning all with his grand, white plume of smoke-cloud—formed altogether a scene of indescribable loveliness. Innumerable boats were dancing on the sea, some laden with fruit,

others carrying pleasure-parties to Capri; many bearing men and women in their picturesque costumes—bare-legged fishermen hurrying with their nets, women with the distaff—and both singing gayly in chorus, as if inspired by the enchantment of sky, and air, and sea, and shore. While my companions were gone into the town in search

of some specimens of carved and inlaid wood, for which Sorrento is quite celebrated, I remained at the window, unable to tear myself away.

The next morning, under the softest sky, and with the wind in our favor, we hired a boat to carry us to Capri, that it might not be said we had failed to visit the far-famed Blue Grotto, which

travellers generally do before they enter the town. When half-way there the breeze suddenly fell, compelling the men to use their oars, which they did most lustily, singing cheerily the while, either to lighten

THE SHRINE.

THE GOAT-MILKER.

their labors, or, according to the tenor of the words, to encourage each other with a prospect of "wine" and "macaroni." However, we were obliged to resign all hope of paying a visit to the "Cave of the Nymphs," the tide being too high to admit of our passage through the opening, which, as everybody knows, is both very narrow and low. So, amiably submitting to our disappointment, and with the ladies of our party decidedly the worse for their attempt to brave "the deep, deep sea," we recrossed the tossing waves, and, feasting our eyes with beauty on the way, landed once more amid the orange-groves of Sorrento.

ROBERT CHAMBERS.

ROBERT CHAMBERS, the younger of the two brothers whose copartnership, under the style of W. & R. CHAMBERS, fills so large a space in the bibliography of the nineteenth century, was born at Peebles, a pleasant and pretty town in the south of Scotland, July 9, 1802. His father was at one time in the enjoyment of comparative affluence; but, becoming security for the liabilities of two friends whose failure involved him in utter ruin, he betook himself to the humble handicraft of a weaver. A few years later he died, in the vigor of life, leaving his widow and seven children wholly unprovided for. After her husband's death, Mrs. Chambers, in the year 1813, removed to Edinburgh with her young charge, where she established and successfully conducted a place of public entertainment, well and favorably known at the time as the "White Horse Inn." In consequence of the family misfortunes, Robert was compelled to abandon his aspirations for a university education, and turn his attention to the stern realities of life. At the early age of sixteen he started a small shop in Leith Walk, for the sale of second-hand books, magazines, and music. In this exceedingly humble position he evinced such tact and judgment in the management of his business, and met with such success, that in 1822 he removed to India Place in Edinburgh, where his neat little establishment soon became a favorite resort with book-buyers. One of his first customers at the new shop told me that, whenever he entered, the young bookseller would lay aside his pen, open a little drawer containing goose-quills, and, while conversing on literary topics, would occupy himself in making quill pens, which he sold among other articles of stationary, steel and gold pens being then unknown.

Robert Chambers's first essay in literature was made by commencing a small periodical called the *Kaleidoscope*. The literary work was entirely his, while his elder brother William set the type and printed it without any assistance. It was not a pecuniary success, and in 1823 the *Kaleidoscope*, after a brief existence, was discontinued. The same year his first work appeared, entitled "Illustrations of the Author of Waverley," a pleasant anecdotal volume, which at once attracted for the young author the notice of the leading literary men of Edinburgh. Jeffrey, then at the height of his own fame, and wielding the powerful pen of the *Review*, with the quick intuition of intellectual clairvoyance, said, "There's mettle in that lad."

In 1824, Mr. Chambers put forth his "Traditions of Edinburgh." This entertaining work, which has since been frequently reprinted, while full of humor and romance, is at the same time most accurate in its details. It enjoyed almost immediate popularity, and gained for the author the friendship of Sir Walter Scott, Henry Mackenzie, and a host of less illustrious but not less ardent admirers, and a recognition, by the literary magnates of the modern Athens, as a brother craftsman in the guild of literature. In 1826 appeared his "Popular Rhymes of Scotland;" in the following year his "Pictures of Scotland," in the preparation of which he displayed the most conscientious industry, not only in the requisite researches among the best authorities, but in traversing a considerable portion of the kingdom literally on foot, as the best method of securing authentic information about the various out-of-the-way nooks and corners not generally visited by tourists and gleaners of local information. His next works were three volumes of histories of the Scottish rebellions, two of a life of James I., and three volumes of Scottish ballads and songs, followed in 1835 by—a monument of industry and evidently a labor of love—the "Biographical Dictionary of Eminent Scotsmen," in four octavo volumes. About the same time Mr. Chambers published a "History of Scotland for Juvenile Readers." In the year 1829 the brothers united in the production of a "Gazetteer of Scotland," which was completed and

given to the world in 1832. During all these years the brothers had remained apart, each having a bookstore of his own.

In the month of January, 1832, Robert and his elder brother William became partners, and began business in Waterloo Place, and on the 4th of February issued the first number of *Chambers's Edinburgh Journal*, at the low price of three half-pence for a folio sheet of closely-printed original matter. The object of the undertaking, to quote the words of the original prospectus, was "to supply intellectual food of the best kind, and in such a form, and at such a price, as must suit the convenience of every man in the British dominions." No such publication had ever before been attempted. It was the pioneer of all our modern cheap literature, and its success was immediate. Within a week fifty thousand copies were sold, and its subsequent circulation exceeded twice that number, notwithstanding the existence of a more extended series of contemporaneous publications of similar scope and character, from the same hands and from various other sources. In 1844 the folio form of the *Journal* was exchanged for its present more convenient octavo sheet. Complete sets of this periodical sometimes occur for sale, and constitute a most valuable repository of instructing and entertaining literature.

Robert Chambers's next important work was his "Cyclopædia of English Literature," a publication of far higher rank than any previous compilation of a similar character. Not less than a quarter of million of copies of this excellent introduction to the British classics have been sold in Great Britain and the United States. This work was followed by his "Life and Letters of Robert Burns," including his poems. This edition is the most complete and useful ever given to the public, and it should not be forgotten that the profits on the work, amounting to over one thousand dollars, were presented to Burns's surviving sister. "A dear and faithful friend has Mr. Chambers been to me," said the old lady to the writer, when he visited her in her beautiful cottage of Bridgehouse, near the banks of the bonny Doon.

"Domestic Annals of Scotland" is the title of Robert Chambers's latest historical work, and he has since edited the "Book of Days" and "Chambers's Encyclopædia," one of the cheapest and most useful books of reference in the language; he also continued to contribute to the *Journal*, for his literary activity knew no abatement with increasing years, fame, and fortune. Turning his attention to geology, he wrote several treatises connected with that branch of science, one of which, published anonymously, created a great sensation in the world of thought. This was the "Vestiges of Creation." He never admitted the authorship; but I am inclined to say, with Professor Silliman, who, in writing to a friend on the subject, said: "If Robert Chambers did not write the 'Vestiges of Creation,' I should like to know who did!"

Among the numerous works which were edited by the two brothers, may be mentioned "Information for the People," of which even more copies have been sold than of Robert's "Cyclopædia of English Literature," "People's Editions of Standard English Works," "Tracts for the People," "Popular History of the Crimean War," and Chambers's educational course, of nearly seventy volumes. The enormous prosperity of their business as publishers induced the firm to establish, in 1854, a branch of their business in London, to which city Robert, in that year, removed with his family. In 1860, in company with Mrs. Chambers, he visited the United States, and many will remember with pleasure his charming manners and conversation. Mr. Chambers's death took place at Edinburgh, on the 17th of March; but the name and style of the firm will continue as heretofore, as he will be succeeded by his eldest son Robert, who has for many years been connected with the business. Their publishing establishment is numbered among the largest in the world, and is only less extensive than that of the Appletons and Harpers. How skilfully it has been conducted, is shown by the fact that Robert Chambers died worth three million dollars, and that the surviving partner and late Lord Provost of Edinburgh has accumulated at least twice that sum, and all made out of their legitimate business as authors, editors, and publishers. The brothers have both experienced in its broadest sense the assurance of the sacred proverbialist, who said: "Seest thou a man diligent in business? He shall stand before kings; he shall not stand before mean men."

On the appearance, several years since, of a collection of miscellaneous papers under the title of "Select Writings of Robert Chambers," in which were included four volumes of his delightful essays, an eminent critic said: "It is marvellous to imagine how much the writer

who dissipates himself in constant periodical publication does actually produce. On an estimate, it would seem as if his every breath had been a printed sentence; as if his mouth never opened but to deposit types, as the gifted fairy princess dropped diamonds. The many years which Robert Chambers in particular has devoted to literary production, have accumulated a mass which, we believe, would astonish, were it all placed in a manuscript heap before his eyes, even himself. And when we reflect upon the character of the whole—how good it has been, how free from objection, how well calculated to attract and benefit the popular mind in the very humblest circles where the art of reading is taught, yet often addressing the highest and most cultivated—we cannot but consider that the writer has been a marked benefactor to his country and kind. He has displayed great judgment in the choice of his many designs, and great talent in his contributions, to their far and wide acceptance as guides to the useful, and pleasant pastimes to the recreative. Scotland has reason to be proud of his and his brother's labors. The influence they have had nationally is incalculable; and the seed they have sown must bear an inestimable harvest for many a future year, and for tens of thousands yet unborn."

JAMES GRANT WILSON.

ROSE-CHARMS.

THE fragrance of the rose is possessed of such an unqualified, never-cloying, ever-fresh sweetness, that we never can have too much of it—never enough. There is nothing that makes a lady's drawer smell nicer than dried rose-leaves, with a suspicion of lavender added—the very fact of such a fragrance being breathed from her clothes-press would be accepted, even in a court of law, as sufficient evidence that the owner was neat, and gentle-thoughted, and pure-minded. Musk, patchouli, jasmine, while each of them has its admirers, have no power to call up the fresh and pleasing associations that attend upon the scent of rose-leaves.

The perfumers, when they wish to preserve rose-leaves fresh until they have got a sufficient quantity to distil, or use in other ways, are in the habit of pickling them, separating the leaves from the stalks, and mixing them into a paste with salt, in the proportion of six pounds of leaves to one of common salt. This, put in jars, will keep any length of time. Packing alternate layers of salt and fresh rose-leaves away in jars is a first-rate, simple way of getting a fine essence of rose. Let the jars remain covered in the cellar for a month or two, then put the pulp into a crape, and press the moisture from it. Bottle this essence, and let it stand out, corked, in the sun and dew, until it is quite clear. One part of this essence, one part of spirits of wine, and ten parts of spring-water, will give you a fine-flavored rose-water. A good tincture of rose-leaves may be made by simply digesting them in strong spirits; while three parts of leaves of just-opened roses to four parts of sweet olive-oil, pounded in a mortar, kept still for a week, and then expressed, will give you an excellent oil of roses.

I knew an old lady who used to make a great variety of charms, amulets, etc., out of rose-leaves, that were more fragrant and quite as durable as those manufactured out of perfumed clays. Her process was to fill a mortar with roses gathered with the dew on them, sprinkle over them a little powdered cinnamon and cloves, and then bray them thoroughly until they formed a stiff brown mass of about the consistence of putty. This she moulded into beads, crosses, and figures of various kinds, and then dried them in the sun or in an oven. They become as hard as pebbles, and retain their sweetness a long while. Fingers that are skillful at moulding may in this way turn out some very pretty and appropriate mantel-ornaments.

THE ENGLISH WAR SECRETARY.

NO man in England is now more prominently before the public than Edward Cardwell, the Secretary at War. His plan for the reform of the army has attracted to him the attention of all classes, and is the entering wedge into a military system which is more costly and less efficient than that of any other great power. Although not widely known in this country, the secretary's name has long been fa-

miliar to political observers as that of an able and industrious statesman whose career, though not remarkably brilliant, has been full of usefulness and honor.

The Right Honorable EDWARD CARDWELL is the eldest son of a wealthy merchant of Liverpool, where he was born on the 24th of July, 1813. His family connections are highly respectable, and his uncle, the late Rev. Dr. Cardwell, was for many years both the Principal of Alban Hall, Oxford, and Camden Professor of Ancient History in that university. After receiving his early education at Winchester, one of the great public schools of England, he was elected to a scholarship in Balliol College, Oxford. Entering that institution in 1832, he distinguished himself by the brilliancy of his scholarship, receiving his B. A. as a double-first on his graduation in 1835. This distinction was followed, not long afterward, by a fellowship in his college.

On leaving the university he studied law, and, on the 16th of November, 1838, was called to the bar of the Inner Temple. But he had little taste for the drudgery of the profession, so, after travelling the Northern Circuit for a few years, he determined to seek his fortune in political life. His choice was a wise one, for, though undistinguished as a barrister, he became in a comparatively short time a conspicuous member of Parliament. Defeated in his first attempt to enter the House of Commons for the borough of Clitheroe in the general election of 1841 by a majority of five, he was soon afterward admitted to that seat on petition, his opponent being declared to have been unduly elected. The high reputation which he brought from the university secured for him an attentive hearing; his parliamentary talents were soon recognized, and he took a prominent place among the members of that select class who in those days were familiarly spoken of as "Peel's boys." The head of the class, whom the Whig *Examiner* used to call the "Pony Peel," is now the leader of the government to which his former associate is attached.

Sir Robert, who was an excellent judge of men, early discerned the talents of the member for Clitheroe, and, in February, 1845, appointed him Joint-Secretary of the Treasury, a position which he held for exactly a twelvemonth. Following his ministerial leader in his departure from a protectionist policy, his support of Peel's financial changes of 1845-'46 commended him to the support of the electors of his native place, and, at the general election of 1847, he was returned at the head of the poll as a member for Liverpool. He retained that position for five years, being overthrown in the general election of 1852, when he unsuccessfully tried to ride two horses, contesting a seat for Ayrshire as well as the one for Liverpool, which he had just vacated. His next political venture was more fortunate, for in the following year he was returned by the city of Oxford as successor to Sir William Page Wood, who resigned his seat to accept the position of vice-chancellor, and who now, as Baron Hatherly, the present lord-chancellor, is Mr. Cardwell's colleague in the cabinet. It is seldom that a public man enjoys for so long a time such pleasant relations with his constituents as Mr. Cardwell has maintained with Oxford, which he has now represented for eighteen successive years. Even his seeming defeat in 1857 resulted in a similar triumph to that gained at Clitheroe fifteen years before, the apparently-successful candidate being unseated on petition in both cases.

Mr. Cardwell first entered the cabinet in 1852 as a member of Lord Aberdeen's coalition government. In his position as President of the Board of Trade he introduced several important and valuable reforms, which increased his reputation as an energetic and sagacious statesman. On the reconstruction of the ministry by Lord Palmerston in 1855 he was left out of office, but, on the formation of the premier's second administration in June, 1859, he was made Chief Secretary for Ireland. This office he vacated in July, 1861, to accept the Chancellorship of the Duchy of Lancaster, which he held till April, 1864, when he was appointed Secretary of State for the Colonies on the death of the Duke of Newcastle. He retained this position after the death of Palmerston on the reconstruction of the administration under the third premiership of Lord John Russell. When the Derby ministry came into power in July, 1866, Mr. Cardwell went with his colleagues into opposition, but, on the formation of the Gladstone government in December, 1868, he assumed his present position as Secretary of State for War.

Besides his political honors, the secretary has gained distinction in other fields. As far back as 1853 he was elected a fellow of the Royal Geographical Society, and ten years afterward received the

honorary degree of D. C. L. from the University of Oxford. His fine intellectual traits were early appreciated by Sir Robert Peel, who appointed him one of his literary executors. His political career has more than satisfied the expectations of judicious friends, who know that the highest honors of the university are not often followed by the most brilliant successes in after-life, and that senior wranglers seldom become great statesmen. He has never been a parliamentary leader, and, though a fluent and graceful speaker, makes no pretensions to oratory. But his industry, learning, and ability, have made his services indispensable to many administrations, and may yet secure for him higher political honors than he has yet attained.

Mr. Cardwell's official career is honorably connected with many important and useful measures. The financial reforms that he has introduced as President of the Board of Trade, the settlement of troubles growing out of the fatal Ashantee expedition, of the New-Zealand War, and of the difficulties in Jamaica and Australia, which he effected while Colonial Secretary, are creditable to his judicious statesmanship. As Secretary of State for War he has been placed in a peculiarly trying position, in which he has borne himself with good sense and moderation. The antagonism that has so long existed between the War Office and the Horse Guards has hampered him as it hampered Lord Palmerston, when as Secretary at War he had to contend against the pretensions of Sir David Dundas. Responsibility without power places a minister in an embarrassing position, and, among the reforms which are absolutely necessary to the regeneration of the War Office is the subordination of the military to the civil authority.

ALEXANDER YOUNG.

CHRONOLOGY OF THE FRANCO-GERMAN WAR.

(FROM THE SURRENDER OF METZ TO THE CAPITULATION OF PARIS.)

OCTOBER 23.—The Parisians, in a sortie, drive the Germans from Le Bourget.

OCTOBER 30.—The Germans reoccupy Le Bourget. Thiers, sent to open negotiations for an armistice, arrives in Versailles.

OCTOBER 31.—Attempted insurrection in Paris under the lead of Flourens, Blanqui, and others. General Trochu and some of his associates kept captives, for several hours, at the Hôtel de Ville, until delivered by loyal National Guards.

NOVEMBER 3.—The Parisians, consulted by the Government of National Defence, sustain it by an overwhelming vote against the advocates of "the Commune."

NOVEMBER 6.—The armistice negotiations at Versailles broken off.

NOVEMBER 8.—The Army of the Loire, under General d'Aurelles de Paladines, advances against the positions of General von der Tann, west of Orléans. Surrender of the fortress of Verdun.

NOVEMBER 9.—Von der Tann, after a severe fight against superior forces at Coulmiers, compelled to fall back.

NOVEMBER 10.—D'Aurelles de Paladines occupies Orléans.

NOVEMBER 17.—The Grand-duke of Mecklenburg-Schwerin disperses, near Dreux, a large force of Mobiles from the west, destined to coöperate with the Army of the Loire for the relief of Paris.

NOVEMBER 21.—Surrender of Ham.

NOVEMBER 23.—Bavaria concludes a treaty of union with the North-German Confederation.

NOVEMBER 25.—Württemberg follows the example of Bavaria.

NOVEMBER 27.—The German First Army, commanded by General von Manteuffel, inflicts a severe defeat, near Amiens, on the French Army of the North.

NOVEMBER 28.—General von Goeben occupies Amiens. The Army of the Loire, confronted before Orléans by encircling forces under Prince Frederick Charles, Von der Tann, and the grand-duke, makes an attempt to break through at Beaune-la-Rolande, but meets with a severe repulse. The forts to the west and south of Paris open a furious cannonade on the adjoining German positions.

NOVEMBER 29.—Combined sorties by the Parisians. General Vinoy assails the Prussian and Bavarian positions near L'Hay, Chevilly, and Choisy-le-Roi.

NOVEMBER 30.—The sorties from Paris renewed on a larger scale. Severe fighting, under General Ducrot, against the Würtembergers and Saxons, around Champigny, Villiers, and Brie, east of the fort of Vincennes. The Germans are repulsed in an attack on Autun.

DECEMBER 1.—Von der Tann successful in various engagements, near Artenay, with the Army of the Loire.

DECEMBER 2.—The grand-duke, on the right of Von der Tann, defeats two French army corps. The Germans assail Ducrot's advanced positions east of Paris. Heavy losses on both sides.

DECEMBER 3.—Prince Frederick Charles forces the Army of the Loire from its intrenched positions at Chevilly, in front of Orléans.

DECEMBER 4.—D'Aurelles de Paladines evacuates Orléans. Ducrot retires within the fortifications of Paris.

DECEMBER 7.—The main division of the former Army of the Loire, the Second Army, commanded by General Chanzy, fights stubbornly but unsuccessfully against the grand-duke at Meung, southwest of Orléans, on the Loire.

DECEMBER 8.—Chanzy forced back from Beaugency, south of Meung.

DECEMBER 9.—Continued successes of the grand-duke. The Diet of the North-German Confederation sanctions the treaties with the South-German States.

DECEMBER 10.—Chanzy assaults the grand-duke, but is repulsed. The French Government delegation transfers its seat from Tours to Bordeaux.

DECEMBER 12.—Surrender of Pfalzburg.

DECEMBER 13.—The Germans occupy Blois.

DECEMBER 14.—The fortress of Montmédy surrenders.

DECEMBER 18.—Von Werder's troops defeat General Cremer, of Garibaldi's command, at Nuits.

DECEMBER 21.—Unsuccessful assault of the Paris garrison on the Prussian Guards and the Saxons, north of the city.

DECEMBER 23.—General von Manteuffel defeats the Army of the North, at Pont-Noyelles, northeast of Amiens.

DECEMBER 27.—The besiegers of Paris open fire on the fortified position on Mont Avron. On the approach of troops under General Bourbaki, the commander of the First Army (a division of the former Army of the Loire), Von Werder evacuates Dijon.

DECEMBER 29.—The French evacuate Mont Avron.

DECEMBER 31.—Forts Nogent, Rosny, and Noisy, east of Paris, shelled by the besiegers.

JANUARY 2.—The fortress of Mézières surrenders. Bourbaki occupies Dijon.

JANUARY 5.—Forts Issy, Vanres, and Montrouge, south of Paris, shelled. Rocroy captured.

JANUARY 8.—The southern parts of Paris shelled.

JANUARY 9.—General Chanzy forced back by Frederick Charles on Le Mans. Severe fighting, at Villersenel, between the armies of Bourbaki and Von Werder. Surrender of Péronne.

JANUARY 11.—Chanzy routed by Frederick Charles before Le Mans. The French lose heavily in prisoners.

JANUARY 12.—Frederick Charles occupies Le Mans. The grand-duke, on the right of the prince, victorious at St.-Corneille. Chanzy's army retreats toward Laval in a demoralized condition.

JANUARY 14.—The Parisians, before dawn, sally against the besiegers at Le Bourget, Drancy, Meudon, and Clamart. They are everywhere repulsed.

JANUARY 15.—Renewed sallies from Paris, without effect. Bourbaki attacks Von Werder in his new positions, south of Belfort. The French are repulsed.

JANUARY 16.—Bourbaki renews his attack with no better success.

JANUARY 17.—After a third repulse, the French begin a disastrous retreat.

JANUARY 18.—King William proclaimed Emperor at Versailles.

JANUARY 19.—The defenders of Paris make a vigorous sortie from Fort Mont Valérien. Heavy fighting. Von Goeben, successor in command of the First Army to General Manteuffel, routs Faidherbe's Army of the North before St.-Quentin.

JANUARY 20.—The French troops at the foot of Mont Valérien withdrawn within the fortifications.

JANUARY 21.—St. Denis opened upon by the besiegers. The troops of General Manteuffel, now commanding the Army of the South, occupy Dôle, with the object of cutting off Bourbaki's retreat.

JANUARY 23.—Tumults in Paris. General Vinoy replaces Trochu in command of the besieged army. Jules Favre goes to Versailles to negotiate for a capitulation. The Germans lose a flag—the only one lost in the war—in a fight with the Garibaldians before Dijon.

JANUARY 25.—Surrender of the fortress of Longwy.

JANUARY 28.—Paris capitulates. A three-weeks' armistice concluded.

JANUARY 29.—The forts around Paris occupied by the Germans. General Manteuffel's troops, near Pontarlier, storm several places occupied by the retreating remnants of Bourbaki's army, now commanded by General Clinchant, and press the demoralized French forces toward the Swiss frontier.

FEBRUARY 1.—General Clinchant, with eighty thousand men, crosses the frontier and lays down arms in Switzerland.

DARIEN CANAL.

TO no part of the Western Hemisphere is there attached so much of romantic interest and mystery as to the long, narrow strip extending from the main-land of Mexico to the broad plains of New Granada. Three hundred and five years ago Benzoni, the Italian traveller, visited it, and his is the first published record of its wonders. The Spaniards had years before made it the scene of their triumphs over the savage natives, and of bloody contests among themselves in their eager lust for gold; but they had given no definite record of its inhabitants or their customs. Since then, one after another of the patient investigators of our world have wandered amid its vast forests and mysterious ruins, or delved in the treasures of its sepulchres, and have given their facts or theories to their fellow-men.

It has ever been looked to, since its discovery, as likely some day to afford the shortest passage to the Indies; reconnaissances of canal and railroad routes have repeatedly been made throughout its length—from the Bay of Tehuantepec to its southern extremity. And though, hundreds of years ago, Cortez hauled his cannon across the passes of the Cordilleras, as yet but one railroad route has cut through that mountain-chain. Another, after long lingering, is soon to be completed in Honduras. But though one and another railroad may span this narrow strip, it is only by the construction of a large, deep ship-canal that commerce can be truly accommodated, and the carrying-trade of the great East attracted to this route rather than to that of the Suez Canal.

The routes, by which it has been proposed to cut a ship-canal are:

1. Across the Tehuantepec Peninsula, *via* the Coatzacoalcos River.
2. *Via* the river San Juan and Lake Nicaragua.
3. The present Panama Railroad route.
4. From San Blas or Caledonia Bay to Bay San Miguel on the Pacific.
5. *Via* the Atrato River.

The second has hardly been taken into consideration of late, as a French engineer reported so great a length of route and the necessity of so much lockage. It is said to have been a favorite route with the ex-Emperor Napoleon.

The third has the advantage of the railroad and a low elevation of the Cordilleras; but so poor are the harbors at each side of the isthmus, that it has so far been left out of the calculation.

The fourth was proved impracticable by Commander Selfridge last winter.

The first and fifth are now being carefully surveyed, and the final results of those surveys will determine which, or whether either, is the practicable route for a ship-canal.

It is assumed by many that such a canal, to be a cosmopolitan route and attract the commerce of the world, should be of such width and depth that any ship now afloat can pass through it—that it should be a "thorough cut," without any other than tidal locks.

The most earnest advocates of the Tehuantepec route do not claim the possibility of making there a "thorough cut," but only that a canal of sufficient width and a depth of twenty-five feet may be dug with twenty-five or less locks, going over an elevation of only six hundred feet. They maintain that the disadvantages thereby incurred would be more than compensated for by the diminished cost, the much shorter route, and, we may add, the liberal grants of the Mexican Government. The great difficulty attending this route is, whether at the summit levels it will be possible to get water for the supply of the locks. This point Commodore Shufeldt is especially expected to determine.

The Atrato route is one covering a great breadth of country; and while on the Atlantic side all lines have commenced in the Gulf of Darien—the mouths of the Atrato—yet numerous termini have been suggested on the Pacific side. Of these, three were surveyed by Major J. C. Trautwine for F. M. Kelly, Esq., and none of them found to be practicable. Of the rest, the one now being surveyed by Commander Selfridge is the sole reliance of the friends of a route *via* the Atrato. This route is up the Atrato and the Cascarica for some miles, and thence across the mountains to the valley of the Tuyara River. It is called the Pass of Paya, from a Spaniard who first drew attention to it; a town on the Tuyara also bears his name. In the latest accounts, Commander Selfridge says that he entered the Atrato by one of its northern mouths, and found it a wide, deep stream, flowing at this season with a rapid current. The only obstructions met with were curious floats of grass, so wide that they could not be cut through; but underneath them was a water depth of over fifty feet. When the explorers left the boats, they took an Indian trail, passing over the mountains at an elevation of not more than three hundred feet.

The Gulf of Darien is one of the finest harbors in the world, the anchorage is good, and it has a depth of from six to eighteen fathoms. It was the site of the first Spanish town on the Isthmus; and it was thence that Vasco Nunez de Balboa set out on his expedition which ended in the discovery of the Pacific Ocean, and finally settled the problem as to whether America was a distinct continent and not a part of Asia. It was the rendezvous of all the expeditions in search of El Dorado; and at one time the great commercial hopes of the Western World were centred in Santa Maria del Antigua del Darien.

Trautwine made several reconnaissances of the country, and in his published report gives a fair and thorough account of its products, soil, climate, the character of the people, etc. The country on the upper waters of the Atrato produces gold in abundance, and it may yet be found in the mountains lower down. Coal is said to exist. Near the mouths the country is flat and subject to inundation. The chief exports now are rubber and Tolu-balsam. The country has been surveyed with similar reports by Lieutenant Griffith, United States Navy, and M. Lacharmie. The latter engineer draws positive attention to the route now being surveyed by Commander Selfridge.

So far as examined, the Atrato and the Cascarica are navigable for the largest class of vessels a distance of forty-five miles from the Gulf of Darien. On the Pacific side, the Gulf of San Miguel is equally as fine a harbor as that of Darien, and the Tuyara River is navigable for a distance of forty miles from the ocean. This is stated to leave a distance of fifty miles between these two points, which must be canalised. A large part of this must be by the deepening of the Tuyara River. Supposing this to cost one and a half millions per mile, we should have a total of seventy-five million dollars, certainly no great amount for a work of such immense importance.

If Commodore Shufeldt's survey should determine that sufficient water exists on the Tehuantepec line, the question would then arise whether the disadvantages of locks are such as to overbalance the difference of distance. On that point it is useless to speculate until the surveys are completed.

TABLE-TALK.

NEARLY a quarter of a century ago, Mr. Disraeli, in one of the cleverest passages of "Tancred," expressed his opinion of Darwinism, or at least of that philosophy of development which is now identified with the name of the author of "The Origin of Species" and "The Descent of Man." The passage we refer to is in the ninth chapter of the first book of the novel, and relates the last interview of Tancred with Lady Constance Rawleigh, with whom he thought himself in love, and who, "having gowned her mind with French novels," was a fertile receiver and producer of the freshest "philosophy:"

After making herself very agreeable, Lady Constance took up a book which was at hand, and said, "Do you know this?" And Tancred, opening a volume which he had never seen, and then turning to its title-page, found it was "The Revelations of Chaos," a startling work, just published, and of which a rumor had reached him.

"No," he replied; "I have not seen it."

"I will lend it you, if you like. It is one of those books one must read. It explains every thing, and is written in a very agreeable style."

"It explains every thing?" said Tancred.

"It must, indeed, be a very remarkable book!"

"I think it will just suit you," said Lady Constance. "Do you know, I thought so several times while I was reading it?"

"To judge from the title, the subject is rather obscure," said Tancred.

"No longer so," said Lady Constance. "*It is treated scientifically; every thing is explained by geology and astronomy, and in that way. It shows you exactly how a star is formed. Nothing can be so pretty! A cluster of vapor—the cream of the milky way—a sort of celestial cheese—churned into light—you must read it—it's charming.*"

"Nobody ever saw a star formed," said Tancred.

"Perhaps not. You must read the 'Revelations.' It is all explained. *But what is most interesting is the way in which man has been developed. You know, all is development. The principle is perpetually going on.* First, there was nothing; then there was something; then—I forget the next—I think there were shells, then fishes; then we came—let me see—did we come next? Never mind that—we came at last. And the next change there will be something very superior to us—something with wings. Ah! that's it. We were fishes, and I believe we shall be crows. But you must read it."

"I do not believe I ever was a fish," said Tancred.

"Oh! but it is all proved. You must not argue on my rapid sketch; read the book. *It is impossible to contradict anything in it. You understand, it is all science; it is not like those books in which one says one thing and another the contrary, and both may be wrong. Every thing is proved—by geology, you know. You see exactly how every thing is made, how many worlds there have been, how long they lasted, what went before, what comes next. We are a link in the chain, as inferior animals were that preceded us; we, in turn, shall be inferior; all that will remain of us will be some relics in a new red sandstone. This is development. We had fins—we may have wings.*"

Evidently, Lady Constance would have made a first-rate Darwinian. Her lucid explanation of the doctrines of "The Vestiges

of Creation," the book alluded to under the title of "Revelations of Chaos," has in a high degree the confident and satisfactory tone of the new school, which "explains every thing," which is always "scientific," which is great on "development," and is positive that "it is impossible to contradict" any of its startling assertions, because, "you see, it is all science," and "every thing is proved—by geology, you know." Twenty-five years later, in "Lothair," Mr. Disraeli resumes the same theme, and treats it in a graver way. We quote from Chapter XXXVIII:

And the philosophers and distinguished men of science with whom of late he had frequently enjoyed the opportunity of becoming acquainted—what were their views? They differed among themselves: did any of them agree with him? How they accounted for every thing, except the only point on which man requires revelation! *Chance, necessity, atomic theories, nebular hypotheses, development, evolution, the origin of worlds, human ancestry*—here were high topics, on none of which was there lack of argument, and, in a certain sense, of evidence; and what then? Between the All-wise and the All-benevolent and man, according to the new philosophers, no relations were to be any longer acknowledged. They renounce in despair the possibility of bringing man into connection with that First Cause which they can neither explain nor deny. But man requires that there shall be direct relations between the created and the Creator, and that on those relations he should find a solution of the perplexities of existence. *The brain that teems with illimitable thought will never recognize as his creator any power of Nature, however irresistible, that is not gifted with consciousness.*

In a still higher tone, Mr. Disraeli again recurs to the subject in the General Preface to the new edition of his works, now being issued in London. He says:

The skeptical effects of the discoveries of science, and the uneasy feeling that they cannot coexist with our old religious convictions, have their origin in the circumstance that the general body, who have suddenly become conscious of these physical truths, are not so well acquainted as is desirable with the past history of man. Astonished by their unprepared emergence from ignorance to a certain degree of information, their amazed intelligence takes refuge in the theory of what is conveniently called progress, and every step in scientific discovery seems farther to remove them from the path of primeval inspiration. But there is no fallacy so flagrant as to suppose that the modern ages have the peculiar privilege of scientific discovery, or that they are distinguished as the epochs of the most illustrious inventions. On the contrary, scientific invention has always gone on simultaneously with the revelation of spiritual truths, and, more, the greatest discoveries are not those of modern ages. No one for a moment can pretend that printing is so great a discovery as writing, or algebra as language. What are the most brilliant of our chemical discoveries compared with the invention of fire and the metals? It is a vulgar belief that our astronomical knowledge dates only from the recent century, when it was rescued from the monks who imprisoned Galileo. But Hipparchus, who lived before the Divine Teacher of Galilee, and who, among other sublime achievements, discovered the precision of the equinoxes, ranks with the Newtons and the Keplers; and Copernicus, the modern father of our celestial science, avows himself, in his famous work, as only the champion of Pythagoras, whose system he enforces and illustrates. Even the most modish schemes of

the day on the origin of things, which captivate as much by their novelty as their truth, may find their precursors in ancient sages; and, after a careful analysis of the blended elements of imagination and induction which characterize the new theories, they will be found mainly to rest on the atom of Epicurus and the monad of Thales. Scientific, like spiritual, truth has ever from the beginning been descending from heaven to man. He is a being who organically demands direct relations with his Creator, and he would not have been so organized if his requirements could not be satisfied. We may analyze the sun, and penetrate the stars; but man is conscious that he is made in God's own image, and in his perplexity he will ever appeal to "Our Father which art in heaven."

These remarks of Mr. Disraeli on this important question of the origin of man and his relations to his Creator seem to us eminently worthy of attention, although the illustrious author is not a professed naturalist, and probably does not know how many bones there were in the megatherium, nor what is the exact arrangement of the spines of the stickleback. But he has evidently given much attention to the subject for at least a quarter of a century, and, being well versed in ancient as well as modern modes of thought, and conversant with the highest reaches of the human intellect, has at least a just claim to be heard when he pronounces these modish speculations of the day to be nothing more than the revival of ancient and long-exploded fallacies.

— "What becomes of all the pins?" was at one time a curious speculation in social science; but we do not recollect that any one has ever asked as to the final disposition of all the cook-books. When the reader recollects that the circulation of these culinary mentors ranks only after that of Bibles, almanacs, and spelling-books, he will perceive that the magnitude of this yearly distribution elevates the question we have propounded into one of no little importance. And it is not only what becomes of all the cook-books that may puzzle us, but where or how can their influence be traced. For a man may go East or go West, he may travel North or he may adventure South, and no fact is more patent than that the admonitions of some authority in the art of cooking are the great prevailing need. We believe that the united efforts of all the writers on cooking have not succeeded in establishing the most elementary principles in the art. Cooking, as it is practised in nineteen families out of twenty, is a matter of tradition; and the instructions of the cook-book, whenever they controvert any of those traditions, are treated with open and unqualified contempt. Cook-books are probably consulted for a new variety of pudding, or a new method of making preserves, or a fresh suggestion as to cake; but we boldly aver that they are never studied with a view to obtain a knowledge of principles. If they were so, how can it be that the frying-pan, in almost all parts of the country, retains its supremacy? Does not every authority in cookery establish the gridiron as the rightful king of the coals? and yet, in face of this, does not nearly every housekeeper maintain the usurping frying-pan in its place? Fried beef, fried ham, fried fish, are the flavorless dishes that

in some parts of the country constitute almost the entire *cuisine*; and all the multitude of cooks, of high or low degree, remain as serenely unconscious of the broil as if cook-books had never been written. Vain, indeed, have been the labors of Leslie, of Beecher, of Ellis, of Elliott, of Soyer, of Blot; tradition and sheer obstinacy have defeated them uniformly from the beginning. Cook-books have been purchased extensively. They have, at first, been read honestly; but the cook, soon discovering that they have assailed the very foundations of her errors, has thrown the revolutionary pages into the rubbish-box, and resolutely continued in her career of rendering that which is wholesome unwholesome, of converting that which Nature made excellent into that which the cultivated taste rejects as abominable. There should be connected with every public school in the country a department for instructing girls in the elementary principles of cooking, and every boy and girl should be educated up to an appreciation of wholesome dishes, rightly cooked. Then we should see reestablished the savory roast instead of the bake, the delicate broil instead of the grease-encased fry; and perhaps the abominations of hot cakes, pies, sweetmeats, and all those stomach-demoralizing inventions, will disappear. Cook-books have failed in their mission; perhaps the school method would do better.

— A very curious work on the physical cause of the death of Christ, written by Dr. Stroud, an eminent English physician, has been republished by the Appletons. It shows, by a multitude of facts and arguments, that the usual phenomena of death by crucifixion were not exhibited in the death of our Lord, but that the circumstances, as described in the Gospel, indicate that He died of a disease of the heart caused by excessive suffering and strong emotion. The author narrates many interesting cases of sudden death from similar causes. His work was the result of great labor and long-continued research, and its value and medical authenticity are strongly vouched for by the eminent authority of Sir James Y. Simpson. Together with its medical features, the book contains an elaborate essay on the relation of the alleged cause and method of the death of Christ to the principles and practice of Christianity.

Literary Notes.

AMONG the new novels published in Germany are to be mentioned specially: Brachvogel's "Glancarty," Hackländer's "Petral," Spielhagen's "German Pioneers," a tale founded on episodes from the early emigration of Germans to the State of New York, several new novelettes by Fannie Lewald, "Mexico," an historical romance by Frederick Gerstaecker, Louisa Mühlbach's "Emperor Joseph and his Landsknecht," "The Victims of Religious Fanaticism," Edmund Hoefler's "Land and Sea," Robert Waldmüller's "Legacy of the Millionaire," and Berthold Auerbach's "Mummy-Seed."

Only nineteen novels were published in France during the war. Most of them appeared in Lyons, Bordeaux, and Marseilles; among these were four by Ponson der Ferrail,

who died in January last at Bordeaux. Quite a number of French works appeared during the war at Geneva, Turin, and Milan, and in Germany. The Brussels publishers also displayed an extraordinary activity after the siege of Paris had commenced.

"The Young Housewife's Counsellor and Friend," is the title of a valuable treatise on the art of housekeeping, including the duties of wife and mother, by a Virginia lady, Mrs. Mary Mason. The book contains excellent recipes, rules, and directions, applicable to the kitchen, dairy, laundry, poultry-yard, garden, nursery, sick-room, and, indeed, all the departments that contribute to make up a comfortable and well-regulated home.

Among the best of our journals dedicated to literature is *The Literary World*, published monthly at Boston and devoted to book reviews and literary intelligence. It is not yet more than a year or two old, but promises soon to reach a vigorous maturity, and to enjoy a long career of usefulness.

The great question of State rights as it stood before the civil war, has been ably discussed by Major J. M. Bundy, editor of that very clever and successful paper, the *New York Evening Mail*, in a pamphlet entitled "Are we a Nation?" published by G. P. Putnam & Sons.

Among the curiosities of the German book market within the next few months will be a translation of Homer's "Iliad" into the language of the Nibelungen Lied, by Professor Carl Bartsch, formerly of Rostock, and now of Heidelberg.

The large "Swedish Cyclopædia," now in course of publication at Stockholm, has only between five and six hundred subscribers in the three Scandinavian kingdoms. When completed, the Cyclopædia will contain twenty-four volumes.

A Turkish gentleman, named Murad Effendi, and at present consul-general of the sultan at Temesvar, has written several novels and plays in the German language, which are warmly praised by the critics of Germany and Austria.

Gervinus, the celebrated German historian and literary critic, whose works on Shakespeare have been translated into nearly all living languages, died at Heidelberg, in the middle of March, in his sixty-sixth year.

Seven friends of the late Alexandre Dumas, Sr., will write a joint biography of the great novelist, which will be edited by his daughter Marie.

The *Revue des Deux Mondes* has passed into the hands of the Duke d'Aumale. M. de Laugel will be its managing editor after the 1st of July next.

A Swedish linguist has translated Frithioff's "Saga" into fifteen different languages.

Scientific Notes.

American Climate.

BY EDWARD DESOR, OF NEUCHÂTEL, SWITZERLAND.

WHEN a German or Swiss emigrant lands at New York he does not perceive that the climate is, on the whole, very different from that of his own country. Nevertheless, after a while, and when he has established himself permanently, he begins to recognize

the differences, which soon oblige him to modify some of his habits, and, at the end of a certain time, compel him to adopt, whether he will or no, those of the Americans, which had been at first the subject of his most bitter criticisms.

This experience, which the greater number of Europeans undergo, does not cease to astonish them after they have reflected upon it. They know that the Northern States are within about the same parallels of latitude as Central Europe. The well educated remember, besides, to have been taught at school that the isothermal lines, or zones of equal temperature, correspond in a still more striking manner. They have, besides, found by experience that winter in the vicinity of New York or Boston is nearly as cold as that of the environs of Frankfurt, Basle, and Zurich, and the summer at least as warm. Nevertheless the two climates have effects altogether different, for which they cannot account. Hence it was that when, a few years since, the *élite* of the German population of Boston organized themselves into a lyceum to establish courses of lectures after the custom of the Americans, the principal, if not the only, question of general physics upon which they manifested an earnest desire to be enlightened was precisely that of climate.

How was it, they asked, that they were all obliged to modify, after a certain time, their habits of life, and even their modes of proceeding in the different arts and trades?

Having been invited to give some lectures on the comparative climatology of the Continents of Europe and America, I was led to investigate in a special manner the nature of those climatic influences and the extent of the modifications which they bring with them.

The phenomena of which we treat are of two kinds: those which relate to common life and which everybody can appreciate, and those which are noticed in the exercise of certain professions.*

To the first category belong the following phenomena:

1. German women are all astonished at the facility with which linen dries, even in the depth of winter, so that washing takes in general less than half the time it does in Europe, which makes the custom so general in the United States of washing every week.

2. On the other hand, those same housekeepers, especially those who live in the country, are in despair at finding how rapidly their bread dries up. Habituated in their native country to making a supply of bread for several weeks, they are in consternation at seeing that their bread, although prepared in the same manner, hardens and becomes uneatable in the course of a few days; they impute it to the quality of the flour or of the water, they lose their temper, they bemoan themselves, and after a while they end in adopting the American custom of making bread every day, or at least every other day.

3. This inconvenience, which is no imaginary one, is compensated in a certain degree by some advantages which we at home do not enjoy. Thus mouldiness is much less to be feared in the United States than with us. It is rare that provisions suffer from it in winter. The cellars, in particular, unless they are in damp and low places, are excellent, whence it is that every kind of food, fruits, and vegetables, are preserved much longer and more surely than with us.

* In speaking of the United States in comparison with Europe, we have especially in view the Northern States of the Union, and not Texas or California, where the climatic conditions are altogether different.

4. The same absence of moisture is observed in a still more striking manner in winter, when the windows of apartments show less moisture upon them than with us. Thus Germans who are accustomed to see at home the window-panes covered with arborizations during a great part of the winter, and can hardly conceive of Christmas without frost-flowers, are disappointed at not seeing them more frequently in America; and yet the weather there is as cold at Christmas as it is at Hamburg or Munich.

5. There are, besides these subjects of common observation, others which bear upon hygiene, and which every one can make in his own person. I will give here but one example—the influence which a residence in the United States has upon the hair, which at the end of a certain period loses its moisture to a considerable degree. Thence comes the greater need of oil and pomatum, and consequently the greater number of hair-dressers. Many a young man who in Switzerland or Germany would recoil from the idea of using pomade or Macassar oil from the fear of seeming effeminate, finds his steps taking more and more frequently the path to the hair-dresser's after having lived for some time in the United States.

The experience undergone in the exercise of the different arts and trades is not less significant. Here are a few examples, which I have received from persons of intelligence and reliability:

1. Builders do not find themselves under any necessity of leaving their houses to dry for a season before surrendering them for occupation. The mason has hardly left when the occupant enters without any fear of rheumatism or any of those infirmities which are so liable to be incurred among us in new houses.

2. House-painters can apply much sooner than with us a second coat of varnish or dis-temper without their work suffering from it.

3. On the other hand, cabinet-makers, and, above all, makers of musical instruments, are obliged to be very careful in the selection of the wood which they work up. Wood which in Europe would be thought abundantly dry could not be made use of in the cabinet-makers' shops of Boston or New York, where it would crack in a very short time. Inlaid floors especially require extreme care, so that they are rarely seen, even in the houses of the most opulent. It is to the same cause that we must attribute the great success of American pianos, while those of Paris and Vienna, perfect as they may be for Europe, deteriorate in America very soon.

4. Carpenters are obliged to make use of a much stronger glue than in Europe.

5. The tanners also have remarked that their skins dry more easily there, which enables them to carry on their operations further in a given time. They are particularly astonished at the rapidity with which the desiccation goes on in winter.

6. Finally, I can cite a fact taken from my own experience as a naturalist. You know what care we have to take in Europe to protect our collections of natural history against dampness; it is only by placing lime or other absorbents in our galleries that we can succeed in protecting them from moisture, especially in new buildings. At Boston I have seen collections of birds and mammiferous animals deposited in apartments which the plasterer had scarcely left without any thought of placing absorbents in them. When I remarked upon this to the curator, expressing my solicitude for so many precious objects which I thought exposed to the risk of being spoiled, "You forget," he replied, "that we are in New England, and not in Europe."

All these different phenomena are referable to one and the same cause, which you have already divined—the greater dryness of the air of the United States. It might even appear idle to dwell as much as I have done upon this peculiarity of the American climate if this result was not apparently in opposition to the meteorological data which we possess relating to that country.

"You assert," it has been often objected to us, "that the climate of the United States is drier than that of Europe; nevertheless we know that it does not rain there any less nor less often than with us."

In fact, the quantity of water which falls in the United States, under the form of rain or snow, not only is not less, but it equals and even surpasses that which falls in Europe. Thus, according to the most recent data which we possess, there falls annually—

In Boston.....	38 inches of water.
In Philadelphia.....	45 " "
In St. Louis.....	32 " "

While in Europe the annual quantity of water which falls at a given point is—

In England.....	32 inches.
In France.....	25 " "
In the centre of Germany.....	20 " "
In Hamburg.....	17 " "

The number of rainy days in the United States is not less than in Europe, with the exception, perhaps, of the British Islands and Norway. On the other hand, it appears to be greater than in Eastern Europe.

Do I need to point out that the contradiction which seems to result from these data is only apparent, and that, notwithstanding the greater quantity of water that falls, the climate is, nevertheless, on the whole, drier in the United States than in Europe? The reason of this is very simple. It is that, during clear weather, the air is less charged with humidity than with us. The atmosphere does not, as in England and the west of Europe, continue in a state nearly that of saturation, but the moment the rain ceases and a change of wind brings back fine weather, the hygrometer falls immediately, and the dew-point keeps sensibly below the temperature of the surrounding air. There is in this respect a similarity between the climate of the United States and that of the Alps. Our mountains, as you know, have furnished results in appearance not less contradictory. Relying on the fact that it rains oftener there than on the plains, the conclusion has been too hastily drawn that the air in the mountainous region was less dry. Thus we see that in the older meteorological manuals, and even in recent works, the climate of the Alps figures among the moist climates, while in reality the air there is much more dry, a fact which any one may verify on a fine, clear day. It is to this very circumstance that we must in great part attribute the fact that we are less fatigued in traversing the mountains than the plains.

The cause of the greater dryness of the American climate it is easy to apprehend. In America, as in Europe, the predominant winds are from the west. On our European coasts those winds come charged with the moisture with which they have become saturated by their contact with the ocean; hence it is that they generally bring with them rain. In the United States it is the reverse. The western winds do not reach the Atlantic coast until after having swept over an entire continent, and during that passage they have lost a great part of their moisture. For that reason they are seldom accompanied with rain. They act the same part that the east winds do with us, which, for the very reason that they come to

us from over the continent, are dry and greedy of moisture. We all know how much more rapidly our roads and our fields dry under the influence of the north wind than that of the south wind (from the lake).*

To what degree do atmospheric conditions, so diverse, influence the conditions of animal and vegetable life? Buffon already, in comparing the animals and plants of the new continent with those of the old, had pointed out a double contrast. He had remarked that the animal species of the American Continent † were in general smaller than their congeners of the old continent, while nearly the reverse was true of plants. He concluded from this that the new continent was more favorable to the vegetable kingdom, while the old was more so to the animal kingdom.

The history of the United States does not extend over a sufficiently long period to furnish us with conclusive data upon the modifications which the different races of animals imported from Europe may have undergone through the influence of climate. It is man himself who will furnish us with the most instructive facts upon this point.

It is now nearly two hundred and fifty years since the first colonists established themselves on the shores of New England. They were, as is well known, dissenters, who expatriated themselves because they wanted a larger share of religious liberty than the English Church was disposed to allow them. They were in every respect true Englishmen, having all the physical and moral characteristics of the Anglo-Saxon race. At the present day, after but little more than two centuries, the inhabitant of the United States is no longer simply an Englishman. He has traits which are peculiar to himself, and which cannot be mistaken any more than the English physiognomy could be confounded with the German. He is, in a word, developed as a Yankee or American type. But as this type cannot be the result of a crossing of races, since it is the most marked in the Eastern States, precisely where the race is less mixed, it must be the consequence of external influences, among which we must place in the front rank those of climate.

One of the physiological characteristics of the American is the absence of *embonpoint*. Pass through the streets of New York, Boston, or Philadelphia, and you will hardly meet one out of a hundred individuals who elbow you who is corpulent, and that one will most generally be found to be a foreigner or of foreign descent.

What particularly strikes us in the Americans is the length of the neck; not, let it be understood, that they have the neck absolutely longer than ours, but that, being more slender, it appears longer. In turn, the American easily recognizes Europeans by opposite characters. It has happened to me more than once that, in forming conjectures with friends upon the nationality of individuals whom we have met on a public promenade, I had doubts as to their origin, while the Americans decided upon the point without hesitation. "But look," said they, "at the neck. No American has a neck like that."

The same remark applies and with more strength to the fair sex; and what will perhaps

* By a natural consequence of the contrast which I am enunciating, these same east and northeast winds, which with us are generally dry and cold, are in the United States invariably accompanied with rain. All who have lived in New York and New England know but too well the northeasterly storms which are so frequent in spring.

† It will suffice to compare the lion with the panther, the rhinoceros with the tapir, the camel with the llama.

astonish us is that, far from complaining of it, they appear to felicitate themselves on this peculiarity. In fact, it is from this that the delicate and ethereal expression arises which is so much vaunted in the American women. But, while we may recognize what there may be of attraction in this type, which, with or without reason, the poets characterize as angelic, I think I do not deceive myself in supposing that our European women, in being more robust and plump, have not any less claims on our admiration.

The difference which I have just pointed out between the Americans and the Europeans is not only the result of a less development of the muscular system; it depends as much, if not more, on the reduction of the glandular system, and in this regard it merits serious attention on the part of the physiologist, as involving directly the future of the American race. It is this that the most intelligent have foreseen; they have felt that there must be a limit to this excessive delicacy of forms, and it is for this reason that, notwithstanding their instinctive aversion to the Irish (who furnish the largest contingent of immigration), they are far from being opposed to the immigration of that race, who, by the plenitude of their forms and the richness of their glandular system, appear made to resist with better effect the influences of the American climate. The remark has, in fact, often been made that the handsomest women are those born of European parents.

More than this, these influences of climate are observed to operate not only on a new generation, but are seen in many instances in individuals when they change their residence from the Eastern to the Western Continent. Thus it is that few Europeans grow fat in the United States, while Americans who live for a short time in Europe acquire an air of health and well-being which is very remarkable. It is sometimes the same with Europeans who return to Europe after a prolonged residence in the United States. In the person of him who addresses you nothing would be easier than to furnish a proof of this.

When it is demonstrated that the greater dryness of the air can occasion, under similar latitudes, differences so remarkable as those we have pointed out, why should we refuse to recognize an influence from this cause in a more complex domain, but not less dependent on external circumstances? This leads us to say a word upon the differences which are to be recognized, in a moral point of view, between Americans and Europeans.

There is no European who, in landing at New York, Boston, or Baltimore, has not been struck with the feverish activity which prevails on all sides. Everybody is in a hurry. Persons on the wharves and on the sidewalks are running rather than walking. If two friends meet in the street, they content themselves with a shake of the hand, but they have, as a general thing, no time for conversation. It is true that something like this can be seen in the seaports and large towns of England; only the activity of the English appears to me more intentional, while that of the Yankee is more instinctive—the result of habit and a natural impatience, rather than of necessity. Hence it is that it betrays itself on occasions when it is absolutely unseasonable. The Americans have been reproached, and justly, too, for not allowing time enough for dinner. On the part of persons under the pressure of business, it could be accounted for on that ground, were it not that the habit is so general as to seem in a certain degree endemic. This is so true that I have more than once seen passengers on shipboard, who had absolutely nothing to do, who were not the less in a hurry

to leave the table. It is only with effort that this impatience has been kept under restraint at the watering-places; but that has been only accomplished by a recourse to what is the most powerful of levers—by stigmatizing this precipitation as unfashionable.

An impatience so general must necessarily have its source in some general cause. Although we possess as yet no precise data to explain the manner in which a greater or less degree of humidity of the air acts on the nervous system, we think we do not deceive ourselves in attributing this greater nervous irritability of the inhabitants of the United States to the dryness of the American climate. May we not cite in support of this opinion the less durable yet not less constant effect which the northeast wind has upon us? The northeast wind, as we have already remarked, corresponds in its effects to the northwest wind in America. It is the wind blowing over the continent, and we can all confirm its desiccating action. But the influence of our northeast wind, you are aware, does not end here; it is more general. The inhabitants of the Jura know but too well that it acts also upon the nervous system, and even upon the disposition of the mind, to such a degree that when the northeast wind, especially a sharp wind, blows for a length of time, they feel a kind of disquietude, of irritation, which even degenerates sometimes into ill-humor; and it is not perhaps without reason that it is said in some localities that the northeast wind makes the women out of temper. It is then, too, that we have the least need of stimulants, and I have heard a shrewd observer make the remark that one should never invite friends to dinner during a northeast wind.

But if a dry wind produces such marked effects in our own country, where, nevertheless, it blows only exceptionally, we may conceive that its influence must be very much greater in a country where it is the dominant wind, as is the case along the Atlantic coast of the United States. From this cause there is also there less need, in general, of stimulants. Shall we err in assuming that it is to the climate that we must refer the much more pernicious effect of fermented liquors in the United States than elsewhere? It is a well-recognized fact that Europeans, and especially the English, who are in the habit of drinking wine and spirituous liquors at home without being harmed by them, are obliged, if not to renounce them, at least to restrict themselves in the use of them, from the moment that they settle in the United States. It is owing to this experience that temperance societies have been able to exert so preponderating an influence there, and to dictate legislative measures, which, if they were enacted with us, might well transform into revolutionists some of our most determined conservatives.

So, also, the Americans, notwithstanding their apparent coldness, are constitutionally more irritable than Europeans. Their susceptibility is proverbial. Can it be said that on this account they are more violently irritable than we are?

According to this theory, they should be so, and they would perhaps be so, if they had not provided in season against the ill effects of this greater nervous irritability by carefully repressing, more than we do, all movements of impatience. Those who have lived in the United States know what care is there taken in the early instruction of children to inculcate the habit of self-government. Hence it results that a people, the most irritable on the face of the earth, is found to be at the same time the best disciplined. Liberty, especially, is only possible in the large measure in which it exists there, because each individual has been early

accustomed to restrain his impulses. To keep himself in this path, the American has no need of a police. Public opinion, besides, is sufficient to recall him within the limits of decorum when he has strayed away from them. It is in the lowest taste for a man who makes any claim to the title of a gentleman to allow himself to get angry, and still more to resort to acts of violence. Thus the Americans take satisfaction in saying, what is but too true, that, when two individuals fall to fighting in the street, it may be taken for granted that they are either Irishmen or Germans.

God forbid, nevertheless, that we should assume that the position, the prosperity, and the liberty of a country are the consequences of its climate! The example of England, with its climate directly the reverse of that of America, would confute us, if we were to hazard such a paradox. But we think, on the other hand, that the greatness of a nation does not depend so exclusively on its institutions as some eminent authors have thought. The climate of the United States, in inducing the adoption of certain principles of education, has perhaps in that way even facilitated the extraordinary development of the American people, under conditions which otherwise might have proved fatal to their prosperity, and, above all, to their liberty.

Great trouble and expense have been caused by the sinking of a portion of the track of the new Jefferson Railroad, where it crosses a swamp in Ararat township, Pa. "It has been found," says the *Montrose Republican*, "that under the swamp is a subterranean pond, of several acres in extent, and of considerable depth. This pond is covered by about six feet in depth of black earth, which supports a heavy growth of woods. The trees are mostly soft maple, pine, hemlock, and birch, many of them ranging from six inches to three feet in diameter. Last fall it was discovered that the subterranean pond contains many fish, of the kind usually found in ponds in this part of the country—pickereel and 'shiners' among others—but all without eyes! In the darkness of their subterranean abode, they have no use for the organ of vision. The Ball Pond, about a mile and a half distant, is now 'growing over.' A considerable part of it has become subterranean within the last twenty years, and, probably, before many years, it will be entirely covered like the other. This pond is about twenty acres in extent. For some distance from the shore, it is filled with a dense growth of water-lilies, and these, no doubt, furnish the foundation on which the superstructure of earth is commenced."

Miscellany.

Bridal Presents to Princess Louise.

BY the queen, a very large, fine emerald, set with brilliants, as a centre of bracelet; another set, as a centre of necklace; a very fine opal and brilliant necklace, with five large opals set round with brilliants, and connected with diamond chain; a large drop brooch, with two very fine opals set round with brilliants; a pair of opal and diamond ear-rings to correspond; a richly-chased silver-gilt dessert service, consisting of one centre, two sides, and four corner ornaments.

Their royal highnesses the Prince and Princess Christian, a beautifully-chased, silver-gilt tea and coffee service, containing the following pieces: coffee-pot, two tea-pots, one sugar-basin, one hot-milk jug, one cream-ewer, in case.

Their royal highnesses Prince Arthur, Prince Leopold, and Princess Beatrice, two diamond daisy-flowers, mounted as hair-pins.

The Duchess of Cambridge, a silver-gilt inkstand in the shape of a shell.

The Duke of Cambridge, a richly-engraved silver salver.

The Duke and Duchess of Argyll, a tiara formed of a band of emeralds and diamonds, surmounted by a scroll-work also of emeralds and diamonds.

The Marquis of Lorn, a beautiful pendant ornament, with a large and fine sapphire, mounted with brilliants and pearls, and pearl drop; the centre forms a bracelet.

The Clan Campbell, a necklace composed of pearls and diamonds, from which is suspended a locket of oval form, with pendant; the centre of the locket is formed by a large and extremely-beautiful Oriental pearl, surrounded by a closely-set row of diamonds of large size and great brilliancy; the outer border also consists of large diamonds, but set in such a manner as to give an appearance of lightness very seldom obtained in ornaments of a similar description; the pendant, the most characteristic portion of the jewel, is suspended by an emerald sprig of bog-myrtle (the Campbell badge), and bears in the centre the galley of Lorn, composed of sapphires on a *pavé* of diamonds; the border, also of sapphires and diamonds, bears the inscription, "Ne obliviscaris."

The ladies and gentlemen of her majesty's household, one large single candelabrum for five lights, four smaller candelabra for three lights each, a very complete toilet service in silver gilt, with the cipher and coronet engraved on each article.

Her majesty's late household, a silver tea and coffee service, with table mounted in silver.

The bridesmaids, a very handsome gold bracelet, with rubies and diamonds.

The Duke of Roxburghe, a silver-gilt teakettle to correspond with the service presented by their royal highnesses the Prince and Princess Christian.

The Duchess of Buccleuch, a richly-chased, antique pattern, silver toilet-casket.

The Countess of Maclesfield, a case of silver-gilt coffee-spoons.

Viscountess Beaconsfield (the wife of Mr. Disraeli), a neck ornament, with border of fine brilliants; emerald cross centre.

From the people of Windsor, a very handsome all-diamond bracelet, engraved with the following inscription: "From the people of Windsor to her royal highness the Princess Louise, on her marriage, March 21, 1871."

From the Earl of Hardwicke, a coral and diamond bracelet, and a turquoise and diamond bracelet.

From the boys at Eton College, a large massive silver tankard and cover, with chased battle-subject in relief, after "Le Brun," on the body, and engraved as follows: "Presented to the Marquis of Lorn, on his marriage, by the present members of his old school, Eton, 1871."

Among the presents were some exquisite specimens of Minton china. A very *recherché* dessert-service from the Princess of Wales, and a superb set of turquoise china vases from the Duke of Abercorn.

The Duchess of Wellington presented a mirror of large proportions, standing forty-five inches high, and thirty-six inches in width; the frame is six inches broad, of curved outline, composed or filled in with delicate open-work tracery of foliage, flowers, birds, figures, and butterflies, all in *repoussé* work, and in the highest possible relief. The mirror is sup-

ported by two pillars, around which are cupids with garlands of flowers, forming a fine example of the Cinque-Cento style of art. The whole is surmounted by a princess's coronet. The frame is in solid silver, and richly gilt.

Louis Napoleon.

Cæsarism is a bad thing in itself, but Louis Napoleon was by no means a bad Cæsar. For nearly twenty years he ruled France with absolute power, and during that time he gave France very much what she wanted. He may not have given her, and we believe he did not give her, what was best for her to have, but he fulfilled many of the conditions that were needed to satisfy her. What has France really wished for during these last twenty years? It has wished to be secure from its own turbulent and dangerous classes, to be aided in growing rich, to have a predominance in Europe, to be able to bully or patronize its neighbors, to be considered "the great nation" in arts and arms. The bulk of Frenchmen thought that the empire gave them all these good things. We have seen enough of the character of the lower section of the population of Paris, in the last few weeks, to understand something of the enthusiasm which the emperor, in the early days of his reign, awakened when he had made it clearly understood that he could save society—that is, that he knew how to shoot down the cruel, gabbling, mischievous ragamuffins, who seek by tyranny to make the lives of all others as miserable and brutal as their own. Then there can be no doubt that the emperor powerfully aided the material progress of France. It is true that France during the same period would have got rich under any government that could have preserved order, for the twenty years of the empire were twenty years in which railways first began to tell on industry, and in which, as the whole commerce and wealth of the world was rapidly extending, France naturally took her share in the good things going. But the emperor personally bestowed the energies of an inventive mind on the work, and brought ideas that were more than French to aid the progress of his people toward wealth. It was not only Paris that he adorned; he did something to beautify or to enrich almost every provincial French town. As for meddling with Europe, he fooled the French on this head to the very top of their bent. Nothing in Europe was to be settled or thought of or done without his approval and that of France, and France was naturally delighted. He even invented new and unheard-of outlets for French vanity, and inspired, or nearly inspired, Frenchmen with a belief that it was their mission to uphold the Latin races in America, and to cripple the maritime power of England by a settlement in Cochín China. Lastly, he did something to please the two great factions of French society, the liberals and the clericals. He freed Italy, and he supported the papacy. In his later days he threw himself more and more on the clericals, for the simple reason that he found that they could do more for him, and that they were the real people to address when he fancied he should like a plébiscite. But he always wished it to be understood that he was a saint somewhat against his will, and that the sinners ought to know that at bottom he was their very good friend. When we look at the chaos and misery in which France now is, at her humiliated armies, impoverished population, at Paris shorn of its glory, and trembling in face of a knot of rebellious National Guards, and at the total loss of her position in Europe, it is not difficult to comprehend the adhesion which for many years she gave to the policy of a man who offered and secured her the reverse of all these evils.

Abstraction.

The whistle shrilled warning, we entered the tunnel,
And darkness Cimmerian succeeded to light;
And I saw the red cinders flash out from the funnel,
Like shot-stars that sweep down the dusk arch of night.

And thus, I exclaimed, through the tunnel of Trouble,
Does man, the express, rush devotedly on;
Nor cares, though unkindness the darkness may double,
For him if the cinders of hope shall have shone.

From the fire-box, his soul, incandescence they borrow,
And cheerful effulgence unceasingly cast;
And, just as the night brings the dawn of the morrow,
The drear tunnel leads into daylight at last.

Then let him not fear, though the shadows grow deeper,
But, thus as I mused, slowly halted the train,
A twist of my collar, a fist in my peeper,
And out jumped a thief with my watch and my chain.

Fire-Signals.

Fire would naturally suggest itself as the earliest and most ready mode of signalling, as the eye is so easily attracted by light. This, of course, would be most effectual during the night, though a thick smoke would show on a clear day at a considerable distance. Accordingly, as far back as old Homer, we find Simon represented as signalling to the Greek fleet to return from Tenedos, now that the stratagem of the "wooden horse" was successful, by lighting fires on the shore. Æschylus, in his "Agamemnon," describes, by the mouth of *Clytemnestra*, how the long-looked-for capture of Troy was made known at Mycenæ. From point to point the glare of the beacon-flames spreads its news—from Ida to Lemnos, Athos, Macistus, Messapium; from the dun heights of Cithæron to Ægiplanctus, which passes on its tale of victory across the Saronic Gulf to Arachnæus, a hill in the hero's home territory; and the weary sentries of Mycenæ hail with joy the downfall of their foe, and wait their liege lord's speedy return. This passage will recall to the memory the famous parallel, if not imitation, by Macaulay, in his "Lay of the Spanish Armada," where the bale-fires rouse England, from Plymouth to Carlisle, for defence against the foe. Later on, in more historical times than those of Troy, Mardonius, the Persian commander left in Greece by Xerxes, is represented as prepared to telegraph the capture of Athens to his master at Sardis, by similar means. But, at the time of the Persian war, fire-signals had been brought to a considerable degree of accuracy. Herodotus tells us that as the Greek fleet lay at Artemisium, waiting for the Persians, it became known to them by fire-signals that their three lookout ships had been captured by the enemy, though, whether they learned in the same way that the crews had made their escape, is not quite clear from the passage.

Fine Feathers.

A new idea has been put into practice, recently, to furnish more regularly and certainly the fine feathers that make the fine birds of the opera, the fashionable church, and the promenade. Ostriches are now farmed in South Af

rics, solely for their feathers. They are kept in lots containing fifteen or twenty acres, which are enclosed by low stone walls, over which the ostriches never leap. The eggs are hatched artificially; but the feathers obtained from the wild birds are still the more valuable in the market. The mode of hunting them is as follows: The finest adult male bird is singled out of the flock of perhaps six or eight, at the season when the feathers are in the finest condition—that is, when the quills have not arrived at their full hardness or development; the plume of the feathers is then beautifully delicate and soft. These feathers are called the blood-feathers, and are considered of the greatest value. The hunter then follows it at a sharp trot, so as not to alarm the bird thoroughly, but follows it up ten miles or more at the same rate of speed, and then stops, letting his horse feed and rest for about twenty minutes. The ostrich also stops. The hunter then mounts again, and follows up the bird at a fast gallop. The ostrich is now, however, stiff and tired after his previous exertion, and does not go along so fast, so that his pursuer soon runs him down, and knocks him on the head with a thong of rhinoceros-hide, which kills him at once. The long white feathers are worth from one hundred and sixty to two hundred dollars a pound, and it takes about eighty of them to make a pound. The process of cleaning and preparing them for commerce is a somewhat intricate one, and requires considerable skill. An ostrich in good plumage is worth about eighty dollars. Some hunters get from fifty to seventy-five birds in a season.

Birmingham (Eng.) School-masters in 1880.

Such a trio as the three masters of this school could scarcely be equalled; the head master did not confine his punishing propensities to his own boys, but would often invade the second master's ground and thrash away; and to make amends to the wounded feelings of the second master, he would also carry out his brutal taste by thrashing those of the third master with equal gusto. The second master followed the example of the premier, and not only did he use his fist in his passion, but his language was disgusting. The third master, of course, followed suit; but he was the worst of all—particularly when the other masters were absent, and he seemed to enjoy it, for, after giving his brutal floggings, he would chuckle and laugh. His chief delight was to hold a boy by the hair of his head down to his desk with one hand, while he beat the boy on his face. No wonder that the boys were continually playing truant, and coming to school at very irregular hours, when they had such cruel masters over them.

Scottish Scenery.

The visitor to the west coast of Scotland is doubtless often disappointed by the absence of bright colors and brilliant contrasts, such as he has been accustomed to in Italy and Switzerland, and he goes away too often with a malediction on the mist and the rain, and an under-murmur of contempt for Scottish scenery, such as poor Montalembert sadly expressed in his life of the Saint of Iona. But, what many chance-visitors despise, becomes to the living resident a constant source of joy. Those infinitely-varied grays—those melting, melodious, dimmest of browns—those silvery gleams through the fine neutral tint of cloud! one gets to like strong sunlight least; it dwarfs the mountains so, and destroys the beautiful distance. Dark, dreamy days, with the clouds clear and high, and the wind hushed; or wild

days, with the dark heavens blowing by like the rush of a sea, and the shadows driving like mad things over the long grass and the marshy pool; or sad days of rain, with dim pathetic glimpses of the white and weeping orb; or the nights of the round moon, when the air throbs with strange electric light, and the hill is mirrored dark as ebony in the glittering sheet of the loch; or nights of the aurora and lunar rainbow: on days and nights like those is the Land of Lorn beheld in its glory. Even during those superb sunsets for which its coasts are famed—sunsets of fire divine, with all the tints of the prism—only west and east kindle to great brightness; while the landscape between reflects the glorious light dimly and gently, interposing mists and vapors with dreamy shadows of the hills. These bright moments are exceptional; yet is it quite fair to say so when, a dozen times during the rainy day, the heart of grayness bursts open, and the rainbow issues forth in complete semicircle, glittering in glorious evanescence, with its dim ghost fluttering faintly above it on the dark heaven?

Varieties.

HENRY WARD BEECHER says: "There is nothing more offensive to me than to be greeted in that rough, religious way, 'Well, brother Beecher, how is your soul to-day?' None of your business! It is a kind of familiarity that I don't relish. If my father were to come to me on the ferry-boat, and put his arm around my neck, I should look up with pleasure; but, should a stranger do the same thing, I should resent the action as an insult. And what I won't permit to be done to my body, I shall not tolerate on my soul."

The new trowel-bayonets, being manufactured at the Springfield armory, are shaped almost exactly like a sharp-pointed trowel, and the dimensions about the same, or much like the spear-heads of the South-Sea Island warriors. Their design is not so much for charges as an efficient instrument for a skirmishing line, and being furnished with finger-pieces where they are joined to the guns, they can be used either to lop boughs or dig holes for picket defence.

A writer in the Illinois Agricultural Report for 1864, says: "The fences of the United States have cost more than the ships, boats, and vessels, of every description, which sail the ocean, lakes, and rivers; more than any one class of property, aside from real estate, except, it may be, the railroads of our country." This may seem like an exaggerated statement, but a little estimate will show that it is not so extravagant as would first appear.

A letter from a member of the Magellan colony speaks of some of the Patagonians as standing six feet six or seven inches, and "from head to heel symmetry itself." Nor is it unusual to find a Patagonian weighing as much as two hundred and eighty-five pounds. With all their splendid physical characteristics, the race is degenerating "through the use of liquor." Moreover, with all their bodily strength, the people are said to be exceedingly cowardly.

An eccentric, wealthy gentleman stuck up a board in a field on his estate, upon which was painted the following: "I will give this field to any man who is contented." He soon had an applicant. "Well, sir, are you a contented man?" "Yes, sir, very." "Then what do you want with my field?" The applicant did not stop to reply.

On the average throughout the year, one railroad-train per minute leaves London. That would be five hundred and twenty-five thousand six hundred trains in the year.

The express system originated in 1839. One express messenger in New York travelled one million five hundred thousand miles in ten years.

A proposition to do away with the present steamboat system of the Mississippi designs the substitution of powerful tugs for steamboats, the passenger-boats being towed thereby.

Prussia exports linens, woollens, zinc, articles of iron, copper, brass, indigo, wax, hams, musical instruments, tobacco, wine, and porcelain.

Not the least serious loss to the French from the war is that of the timber which has been so ruthlessly wasted, and which will take many a long year to restore.

Sabastian Bach is said to have been the first pianist who discovered the use of the human thumb. Previous performers discarded the use of that member.

A thief who lately broke open a grocer's warehouse excused himself on the plea that he only went to take tea.

A laurel-wreath of gold has been voted by the ladies of Munich to the Emperor William, and a statue to Count Moltke.

To lady railroad travellers: For information respecting the last train apply to the leading dressmaker.

The wail of a Western poet: "'Tis sweet to court; but, oh! how bitter, to court a gal and then not git her!"

Father Hyacinthe wants to see more of the United States, and has announced his intention of visiting us during the present summer.

Miss Elizabeth Stuart Phelps, author of "The Gates Ajar," is about to be married to a young clergyman.

Henri Rochefort is suffering from consumption, and cannot, in the nature of things, live long.

The exportation of oysters for seed to England, is a new feature in the American oyster-trade.

Why are birds melancholy in the morning? Because their little bills are all over dew.

It requires two or three thousand tons of food each day for Paris.

The Museum.

IN the discussion of Darwinism, the advocates of that theory make a considerable point of the fact that certain species of butterflies almost exactly resemble in appearance the leaves of the plants to which they resort. This resemblance, or mimicry, as it is called, is, of course, a great protection from the birds which seek to devour the butterflies. Perhaps the most striking example of it is that of the leaf-butterfly, which is very common in the East Indies. The upper surface of these butterflies is very striking and showy, as they are of a large size, and are adorned with a broad band of rich orange on a deep-bluish ground. The under side is very variable in color, so that out of fifty specimens no two can be found exactly alike, but every one of them will be of some shade of ash, or brown, or ochre, such as are found among dead, dry, or decaying leaves. The apex of the upper wing is produced into an acute point, a very common form in the leaves of tropical shrubs and trees, and the lower wings are also produced into a short narrow tail. Between these two points runs a dark curved line exactly representing the midrib of a leaf, and from this radiate on each side a few oblique lines, which serve to indicate the lateral veins of a leaf. These marks are more clearly seen on the outer portion of the base of the wings and in the inner side toward the middle and apex, and it is very curious to observe how the usual marginal and transverse striae of the group are here modified and strengthened so as to become adapted for an imitation of the venation of a leaf. . . . But this re-

semblance, close as it is, would be of little use if the habits of the insect did not accord with it. If the butterfly sat upon leaves or upon flowers, or opened its wings so as to expose the upper surface, or exposed and moved its head and antennæ as many other butterflies do, its disguise would be of little avail.

We might be sure, however, from the analogy of many other cases, that the habits of the insect are such as still further to aid its deceptive garb; but we are not obliged to make any such supposition, since Mr. Wallace had the good fortune to observe scores of *Kallima paralekta*, in Sumatra, and to capture many of them, and vouches for the accuracy of the following details. These butterflies frequent dry forests, and fly very swiftly. They were seen to settle on a flower or a green leaf, but were many times lost sight of in a bush or tree of dead leaves. On such occasions they were generally searched for in vain, for, while gazing intently at the very spot where one had disappeared, it would often suddenly dart out,

Leaf-butterfly in Flight and Repose.

and again vanish twenty or fifty yards farther on. On one or two occasions the insect was detected reposing, and it could then be seen how completely it assimilates itself to the surrounding leaves. It sits on a nearly upright twig, the wings fitting closely back to back, concealing the antennæ and head, which are drawn up between their bases. The little tails of the hind-wing touch the branch, and form a perfect stalk to the leaf, which is supported in its place by the claws of the middle pair of feet, which are slender and inconspicuous. The irregular outline of the wings gives exactly the perspective effect of a shrivelled leaf. We thus have size, color, form, markings, and habits, all combining together to produce a disguise which may be said to be absolutely perfect; and the protection which it affords is sufficiently indicated by the abundance of the individuals that possess it. We copy this account of the leaf-butterfly and the accompanying illustration from Mi-vart's interesting "Genesis of Species" just published by D. Appleton & Co.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER XVII.—THE APPLE OF DISCORD.

MISS LESTER fulfilled her own prophecy, and remained in bed the better part of the next morning; but Katharine rose at a reasonable hour, and went below. As she paused at the foot of the stairs, debating in her own mind which one of the numerous doors around was likely to lead into the breakfast-room, a step sounded behind her, and a pleasant voice said:

"Good-morning, Miss Tresham. Merry Christmas to you!"

"Good-morning, Miss Vernon," answered Katharine, turning to face the speaker, who had come down the staircase in her rear, and was close at hand. "Merry Christmas to you! Is it not a beautiful day?"

"Delightful!" said Miss Vernon. "Let us go to the front door, and look at it."

To the front door they went, accordingly, and met the full brilliance of the sparkling winter morning—the floods of dazzling sunshine, the refraction of light from the gravel sweep, and the frost-gemmed trees and shrubs that stood out clearly in the transparent atmosphere.

"Glory to God in the highest, and on earth peace to men of good will!" sang Miss Vernon, softly, as she stood and looked out, shading her eyes with one hand, while the sunbeams turned her hair to shining gold.

"I like your translation better than ours, Miss Tresham; and, oh, I wish you would teach me to sing the Latin as you sang it last night! It seemed to me I never heard a language half so beautiful. You don't pronounce it as our university men do."

"No, indeed, I do not," said Katharine, smiling. "I call their pronunciation barbarous, and so does anybody who has ever heard the other. I'll teach you the 'Gloria' with pleasure, Miss Vernon."

"Thank you; I shall remember the promise. Do you know that, like Lord Byron, you have waked up this morning and found yourself famous—as far as it is in the power of Annesdale to bestow fame?"

"Not I."

"Well, it is true, nevertheless. Everybody is talking about your voice. Here come two of your audience now. Ask them if it is not so."

Katharine, whom the sunlight was nearly blinding, looked in the direction indicated, and perceived two gentlemen advancing along a side-path to the house. As they came near her, she saw that one of them was Morton Annesley, and the other a tall, stalwart, sunburnt person, who had been presented to her on the preceding evening as Mr. Seymour. Before she could answer her companion, they came up the steps, and, all smiling and slightly purple from the cold, were making their Christmas greetings. They had been to the stable to look at their horses; had found the morning charming, but rather cool; and were on their way back for breakfast—had the ladies been to breakfast?

"Not yet," said Miss Vernon. "We will take you in and give you some hot coffee as a reward for your exertions. What can there be so interesting in horses, I wonder, that men should go out and stand in the cold for the pleasure of looking at them? Mr. Seymour, I heard those hounds of yours making a terrible noise this morning. When are you going on a fox-hunt?"

"To-morrow morning at three o'clock, according to our present arrangement," said Mr. Seymour, smiling; and to Katharine, standing by, it was evident that this stout Nimrod was like wax in Irene Vernon's dainty hands, and before the glance of her sunny violet eyes.

"And may I go too?—Miss Tresham, did you ever go fox-hunting? It is the most delightful thing in the world.—Mr. Seymour, may I go too?"

"I am afraid it is impossible, Miss Irene."

"But why? Don't I often go, when I'm down in Apalaska?"

"Certainly you do. But it is different here. This is a rougher

country, and we may have to ride eight or ten miles before we start a fox—at least, Annesley says so."

"I think there is very little doubt of it," said Annesley. "Miss Irene, I am afraid there is no hope of your going; but I am sure Seymour will bring you the brush of the first fox that dies, and you can hang it at the side of your bridle.—By-the-way," he added, turning suddenly to Miss Tresham, "won't you try Ilderim, now that you are here? I should like it very much, and, if you would like it too, there is no possible reason to be urged against it."

"Mr. Annesley, I"—here she broke down, and laughed—"I really think you ought not to tempt me so. If I would like one thing more than another, it would be to ride Ilderim."

"Then, for Heaven's sake, why do you hesitate to do it?"

"Don't be profane, and I will tell you after a while. Now, we must go in to breakfast."

They went in, and found the breakfast-room bright and cheery, and full of the sound of clattering dishes and pleasant voices. It was on the east side of the house, and the bright sunlight was pouring across it in long lines of level light. Half a dozen round tables took the place of one long, solemn board, and at five out of the six sociable groups were drinking their coffee and eating their steak with healthy appetites. The four who came in now took their seats at the unoccupied table, and smiled and nodded in answer to the greetings given from all sides. Miss Vernon, in particular, came in for a large share of these.

"Irene, here are some oysters!" cried one young lady. "Do you know they came from Mobile packed in ice, and Mr. French says they were brought specially for you? Take some; they are very good."

"You are very good," said Irene, looking at Mr. French. "Is it possible they are fresh?"

"Taste them, and see," said Morton, setting a dish before her. "The cold weather stood our friend.—Miss Tresham, do you like oysters?"

"Who does not like oysters, Mr. Annesley?"

"A great many people here in the backwoods, I assure you. Ask Mrs. Dargan over there what she thinks of them."

"I think they are abominable, and not fit for a Christian to look at," said Mrs. Dargan, with a shudder. "I would just as soon eat frogs."

"There is nothing better than a good fricassee of frogs," said Mr. Langdon, who prided himself on being cosmopolitan in tastes and ideas. "You are right, too, Mrs. Dargan—there is something in the flavor not unlike oysters."

"I said nothing about the flavor!" cried Mrs. Dargan. "Goodness, Mr. Langdon! you don't suppose I ever tasted one of the things?"

"If you went to France, my dear madam—" began Mr. Langdon.

"I should be afraid to open my mouth after I got in the country, for fear I might be made to eat some of their dreadful concoctions without knowing it," interrupted the lady.

"Then let me advise you not to go to the country, for a fasting-tour would be any thing but pleasant.—Annesley, my good fellow, what is the best way to eat an oyster?"

"Each to his taste," answered Annesley, with a smile.

"Not by any means," said Mr. Langdon. "The best way, in fact, the only civilized way, is—raw. In that case, they only need a little pepper and salt."

In this vein the conversation flowed back and forth—trivial, but very easy and unrestrained, and occasionally sparkling with a touch of humor or pleasantry. Katharine liked it, as she liked soft fabrics, and rich rooms, and delicate perfumes; for, alas! Mr. Warwick was right, and she was by nature cursed with that sensitive appreciation of refinement and the appliances of refinement which makes life in the lower grades of society nothing more nor less than a positive torture. After a while, Mrs. Annesley came over and sat down by her.

"I suppose I must not include you, Miss Tresham, in the parties made up for church this morning?" she said, by way of excuse for her advent.

"No, I shall not go," answered Katharine, who thought the question quite unnecessary.

"Fortunately—should one say fortunately about such a thing?—gentlemen are not very devout," said the lady. "If they were, I hardly know how all these good people would be conveyed to hear Mr.

* ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

Norwood preach.—Irene, I believe I heard you promise Morton that he should drive you?"

"You heard me promise Mr. Seymour," said Irene, who saw Mrs. Annesley's schemes for throwing Morton and herself together, and always quietly managed to defeat them. "He asked me—or, no, I believe I asked him; but, whichever it was, I am to have the pleasure of going behind those beautiful grays of his."

"Miss Irene, you are utterly faithless," said Morton, laughing. "I shall ask Mrs. Raynor to console me for your desertion."

"She will tell you that George is afraid to trust her with your horses."

"I shall not ask George any thing about it. Yonder she is now."

He rose hastily, and went up to Mrs. Raynor, who entered the room at the moment. Mrs. Annesley watched him with a smile, then quietly took the vacant seat by Katharine. She was very gracious, and talked so pleasantly that the girl was half beguiled out of her unconscious distrust and dislike. But she noticed—even a duller woman would have noticed—how cleverly her hostess contrived that, in leaving the breakfast-room, she should be separated from Morton. It was only what Katharine herself had intended; but, notwithstanding this intention, she could not help resenting Mrs. Annesley's interference. However conscious we may be of our social drawbacks, it is not pleasant to have the perception of them thrust remorselessly upon us. More annoyed than she would have thought possible by such a trifling evidence of what she already knew very well, Katharine went upstairs; and while she was assisting at Miss Lester's toilet, and cultivating Spitfire's acquaintance, her name, if she had only known it, was the topic of conversation with two different groups below-stairs.

Most of the young ladies were engaged in putting on their wrappings for the drive to church; but in the drawing-room a council of elderly ladies was convened around the fire, and Mrs. Annesley found herself courteously but decidedly on trial.

"My dear Mrs. Annesley, I can understand why you wished to gratify Adela in bringing her here," said one of the vigilance-committee; "but, if I had been in your place, I really would have thought twice about it. She is a dangerous girl—I can see that—and with all these young men—"

"The young men can take care of themselves, I suppose," said Mrs. Annesley, smiling, but in her heart feeling any thing but amused.

"Indeed, I think they are twice as foolish as girls," said the first speaker, hastily. "You hardly ever hear of girls acting as many of them do. There was poor Harry Anderson—he married a governess, and she was so extravagant that she nearly ruined him. He did not know any thing about her family, either; and I hear that she had a whole set of disreputable relations who came and lived with him."

"A drunken father," said Mrs. Dargan, solemnly. "Poor Harry at last had to order him out of the house. Do you know any thing about Miss Tresham's family, Mrs. Annesley?"

"My dear Mrs. Dargan, how should I?" asked Mrs. Annesley, becoming less and less amused. "I don't vouch for Miss Tresham in any way. I am civil to her because she is under my own roof; but she is here in—well, I may almost say in a professional capacity."

"We know that," said another lady—the mother of the Mr. Talcott who had been attentive to Katharine the evening before. "But, then, is it right to throw temptation in the way of the young? It seems to me that *that* is the light in which to look at it. The girl is certainly pretty, and, what with her looks and her singing, she might easily turn the heads of—of some of these young men. I am not thinking of my own son," said the poor woman, who was thinking of nobody else; "but there are plenty others here, and—and I can see that they find her very attractive."

"She is an atrocious flirt, that is very clear," said Mrs. Dargan, sharply. "I read her at once, like a book; and I really wonder, Mrs. Annesley, that you did not see what efforts she has made to attract your son."

"Morton paid her some attention at my request," said Mrs. Annesley, with her heart sinking lower every minute. She carried it off very bravely; but really a terrible distrust seized upon her. Had she really done mischief, after all? In the effort to bring Katharine fairly within the scope of her power, had she thrown a firebrand into her party, and made Morton's infatuation the subject of the observation which it had hitherto escaped? Almost all who deal in schemes and stratagems, must sometimes know the dread of having overreached their own end—and, having once known it, they must be aware that

few dreads are more terrible. "Good Heavens! what do they find in her so attractive?" she said at last, almost impatiently. "She seems commonplace enough to me."

"Well, do you know, I think she is very pleasant," said a mild voice from the sofa, where the senior Mrs. Raynor sat—a gentle, pensive lady, all bundled up in a cashmere shawl. "She is a pretty creature, and her manners are so nice. She talked to me for some time last night, and I took quite a fancy to her. She told me a great deal about the West Indies, and I think the climate would certainly suit me. If George is able to leave home, I shall try it next winter."

The other ladies exchanged significant glances. Mrs. Raynor could afford to take a fancy to this girl, for both of Mrs. Raynor's sons were safely tied in the bonds of matrimony, and therefore not in a position to make fools of themselves. While, as for them—there was hardly one of them who had not some young man, some son, or nephew, or prospective son-in-law, for whose safety of head and heart she was at that moment quaking.

Meanwhile, the objects of all this solicitude, the young men aforesaid, were smoking their cigars in and around the front piazza, and, in their free-and-easy fashion, canvassing the governess, who, to them, simply stood on her merits as a woman. It may be as well to state that Morton was absent, for, if he had been present, the conversation would certainly have received a summary check.

"I believe I will send up and ask Miss Tresham to go to church with me," said Mr. Langdon, watching meditatively the elegant equipages which, one after another, swept up before the door. "My horses are not quite as fine as Seymour's, and my buggy isn't half as new as Annesley's; but, still, I think I'll ask her.—Here, Sam—go up to Miss Tresham's room, and give her my compliments—Mr. Langdon's compliments—and say—"

"You may spare yourself that trouble, Tom," said Talcott, who was standing near. "Miss Tresham isn't going to church."

"Did she tell you so?"

"No; I didn't ask her—but she told Mrs. Annesley so. I'd have asked her myself, if it hadn't been for that. But, then, I remembered—she is a Romanist, you know."

"How the deuce should I know?"

"You might have heard her say so—as I did. I asked her something about that song last night, and she told me she was a Catholic. I suppose that's how she came to know Latin. She must be amazingly clever."

"She is certainly amazingly pretty," said Seymour, laughing, while Langdon gravely smoked his pipe, and regarded the horses. "My test of beauty is, whether a woman will make any showing by the side of Irene Vernon. I saw them both together this morning, and Miss Tresham not only made a showing, but a very good one. Who is she? Where does she come from, anyhow?"

"You know Marks—the man who is cashier of the bank in Tallahoma?" said George Raynor. "Well, this girl is a teacher in his family. He picked her up somewhere, and they do say"—here the speaker looked significantly mysterious—"that one of our friends, not a thousand miles away, is seriously smitten."

"Who?—Talcott?" asked Langdon, looking round.

"I smitten!" cried Talcott, reddening up in a minute. "Why, good Heavens! I never thought of such a thing. She's very nice; and I got on very well with her last night—but I don't see how you could say such a thing as that, Raynor."

"There's something in a guilty conscience, Fred," said Raynor, laughing. "I was not even thinking of you. I was thinking of—well, it don't matter who. She is a pretty girl, there's no doubt of that," added he, candidly. "Flora tells me that Irene has taken quite a fancy to her, and that is remarkable, for Irene doesn't often take fancies—especially to women."

"She is too nice for a governess," said another smoker. "Talcott, you'd better go in for the prize. She wouldn't cost you much trouble, and that's a consideration."

"Stop that, Hal," said Seymour, gravely. "I can't bear to hear a woman talked of in such a strain. Governess or no governess, Miss Tresham is a lady, and should be treated as one. Now, I would sooner insult her to her face than behind her back."

"Who thought about insulting her!" demanded the other, flushing, and looking offended.

"You didn't, I suppose; but it is a bad habit to talk in that way, and, if I were you, I would break myself of it."

What the recipient of this frank advice would have replied, was a matter open to conjecture. He frowned, and his answer would probably not have been very amiable, if a group of brightly-dressed girls had not at that moment come down the staircase, and crossed the hall into the piazza.

Immediately all the bustle of departure began, and, before long, carriage after carriage rolled out of the open gates, and down the bright, sunlit road. Mrs. Annesley's was the last to leave, and, when her foot was on the step, she turned suddenly to one of the servants standing near.

"To-day is mail-day," she said. "Has anybody been to the post-office, Joe?"

It was at once evident from Joe's face—a good deal blank, and a little foolish—that such an idea as mail-day or post-office had never entered his Christmas-beset mind. Holding his cap between two fingers, he scratched his head with the others, as he replied: "I don't b'lieve anybody have thought about it, mistiss."

"Take a horse and go at once, then," said his mistress. "Don't forget it now—for I shall expect to find the mail when I get back."

"I sha'n't forget it, ma'am."

And, as Mrs. Annesley drove off, she had the satisfaction of seeing him take his way to the stable with laudable haste.

An hour later Katharine was crossing the hall, when a servant entered with a large and well-filled mail-bag slung across his shoulder. "Letters, ma'am?" he said, touching his cap, as if the announcement must necessarily interest the young lady. But she shook her head with a smile. "I am not expecting any thing," she said; and with that was passing on, when, through the open drawing-room door, Miss Lester's voice sounded.

"Did I hear something about letters, Miss Tresham? Oh, yes, there they are. Would you mind looking over them, and getting mine for me? I know, mamma must have written, and I hate to move—Spitfire is so comfortable, that I can't bear to disturb him."

To prevent Spitfire's being obliged to relinquish his position on his mistress's dress, Katharine made the messenger empty the mail-bag on a table near at hand, and began looking over the different letters. There were some for almost everybody, and she soon found Miss Lester's. As she was turning away with them, she noticed that one missive had dropped to the floor, where it lay face downward. Stooping to pick it up, she saw that, although it was a large, heavy letter, the address was to Mrs. Annesley—and, seeing this, she could not help looking at it a little curiously. There could be no mistake in the character, it was "business" all over, from the seal to the very post-mark, and did "not seem like Christmas," Katharine said to herself. Such a letter should not be opened until the great festival was over, she thought; but still she laid it on top of the pile, and, leaving it with its great broad face upward, went into the drawing-room to Miss Lester.

When the party came back from church, and filled the house with the gay sound of their voices, Morton chanced to be the first person to go up to the hall table and examine the mail. The large, double letter seemed to puzzle him too. He took it up and looked at it, much as Katharine had done, then laid it on one side as if for further examination, and tossed over the others.

"Here, Seymour—Langdon—Talcott," he cried, "here are letters for all of you, and for the ladies, too. Where have they all vanished to?—Miss Irene, don't you want to hear from home? Here are two letters with the Mobile post-mark on them.—Miss Alice, here is one for you.—Yes, Miss Mary, I am sure I saw your name a minute ago."

He was soon surrounded by an eager group, for it is surprising how everybody—excepting, perhaps, a jaded business man—is excited by the prospect of letters, how fond everybody is of receiving them, and how shamefully remiss about answering them. Those who had got letters, were sitting on the chairs nearest around, reading them, and those who had not, were standing about, looking very discontented, when Mrs. Annesley entered and walked up to her son, who was opening his own.

"Any thing for me, Morton?" she asked, as carelessly as possible.

Her son looked up with a start, and held the large missive toward her.

"A letter from Burns," he said. "I wonder what he is writing to you about? He ought to know that I don't like you to be troubled with business matters."

"I wrote to him, and this is merely a reply," Mrs. Annesley answered. "It is about my own business, Morton—you need not be afraid that I will meddle in yours," she added, a little bitterly; and before he could reply, she had taken the letter and passed on upstairs.

As soon as she was safely within her own room, she tore open the sheet of paper that in those days did duty for an envelope, and, without glancing at the lawyer's letter, drew forth the enclosure which it contained. She spread it on the table before her, but her excitement was so great that for a moment she could scarcely see—then a mist seemed suddenly to clear away, and, though she still trembled with eagerness, she was able to read the lines on which depended so much. The letter was addressed to Mr. Burns, by his agent in London, and ran thus:

"WM. F. BURNS, ESQ.

"DEAR SIR: In reply to your favor, I am enabled to say that I have called on Messrs. Rich & Little, and found them quite ready to afford me any information regarding Mr. Henry St. John. He is known to them as the friend and secretary of one of their clients—a wealthy Scotch gentleman; and, although they have never done business on his own account, they speak highly of him from personal acquaintance. With regard to the lady, however, they were decidedly reticent. When I pressed my inquiries on this score, I was checked very shortly, and reminded that a matter of private business could not be discussed with any but the person or persons immediately concerned, and that, if I wished information about Miss Tresham, I had better apply to Mr. St. John. I took the hint, and Mr. St. John's address, and went to Scotland to see him. When I reached the house to which I had been directed, I found it closed and deserted. The servants informed me that both the proprietor and his secretary were absent, and, it was supposed, had left the country. Being near Cumberland, I then went to Donthorne Place, and made my inquiries. Here I met with more success. The lady whom I saw answered my questions without any hesitation. Miss Tresham had been in her family for a year, and had given entire satisfaction. She had not been discharged, but had resigned the situation of her own free-will, and against the wishes of her employers. The lady knew nothing of Miss Tresham's antecedents, except that she was a West Indian, and had come to her very well recommended. She seemed much surprised when I asked her if she knew any thing of her after her departure from Cumberland, and replied at once in the negative. From none of the servants or hangers-on about the place could I obtain any more definite information. Miss Tresham seems to have been very well liked while she was in Cumberland, and to have left a good name behind her when she went away, but nobody considered her of sufficient importance to inquire about or take interest in after she passed out of their lives.

"I am very sorry that this information is so meagre, and that I have not been able to give you more satisfaction, but I have been stopped at every turn—first by the solicitors, then by Mr. St. John's absence, and finally by the complete manner in which all trace of Miss Tresham had vanished from Donthorne Place. If you wish any further inquiries prosecuted, let me hear from you without loss of time.

"Respectfully, etc.,

"T. W. WARD."

Mrs. Annesley read the letter to its end—her lips parted, and her breath coming more quickly, with every minute. When she finished she stopped a second—in blank astonishment, as it were—then let her face drop on her hands, while something like a dry sob rose in her throat. This was all! She had steadily worked herself into the belief that some terrible disclosure was to reward her exertions, some disclosure that would at once open Morton's eyes, and place Katharine in her power; and now this cruel letter came, and, after all the hope, all the expectation, left the mystery as complete as ever! Surely it was bitter! Surely it was hard! She paid no heed to the lawyer's letter lying unread before her. She knew so well what he said, that the mere thought of reading the curt, business-like sentences filled her with disgust. For a time she felt as if her whole plan, and, with her plan, the whole tissue of her life, had suddenly come to an end. If she could show him nothing worse than this, Morton would marry the girl, and then—

But she was not a woman to remain long in such a mood as this. Soon she came to herself, and the first proof which she gave of it was to take up the lawyer's letter and read it. "I will see what he has to say," she muttered. This was what Mr. Burns had to say:

"DEAR MADAM: Herewith you will find enclosed the letter from London of which I spoke in my last. I am sorry to say that my agent has not justified my opinion of him. The information which he sends, any child, who had been told to make the inquiries, could easily have acquired. He tells us no more than we knew before, and does not throw a single ray of light on Mr. St. John or Miss Tresham. I am very sorry, and a little ashamed to think that at my age I should have employed a man who could do no better than this.

"You ask for my opinion of the matter. I know too little yet to form or express an opinion, but if you decide to prosecute your inquiries, I would advise you to do so through certain channels of secret inquiry which are now established in all large cities, and employ agents so well trained in the work, that for a consideration—and, generally, it must be confessed, a very large consideration—it is possible to learn anything about anybody. This mode would be expensive but secure; and if you wish to track the secret down, in the shortest possible time, I would counsel you to let Miss Tresham alone, and follow Mr. St. John and his employer. It is evident to me that there is some close connection between them, and what you desire to know. May not Mr. St. John be acting for his employer in the matter? I merely throw out the suggestion. Trusting that you will let me hear from you on the subject, I am,

"Very respectfully,
"WM. F. BURNS."

When Mrs. Annesley put down this letter, she felt that her face was burning. It was the cool proposition of the lawyer, the cool words, "certain channels of secret inquiry," which had suddenly showed her where she was standing, and what she was doing. She said "Good Heavens!" all at once, as if she had received an unexpected blow; and then she was silent, and tried to look the situation in the face.

She was a selfish woman, and a woman whose whole heart was bound up in her children and their interests—bound up, not with the tender devotion that would make some women martyrs, but with a steady force that would have sacrificed all the rest of the world to them—but she was not at all the scheming *intrigante* of romance. If she proved merciless in the case of her cousin, it was not so much from that desire for Morton House which long indulgence had fostered, as from the rankling dislike born of early envy. With regard to these inquiries about Katharine, she had begun them, and from the first looked upon them as the purest matter of duty. As she told Adela, she had made up her mind that the girl was an unprincipled adventuress, and she would have thought it wrong to hesitate at any means which would remove her from Morton's life. To-day, for the first time, a feeling of dismay came over her. What was she doing? Was this indeed a thing which no man or woman of even the merest worldly honor should be guilty of? She was coolly advised to prosecute secret inquiries into the private life of people she had never seen, and the advice struck her with a sudden sense of shame and humiliation. "It is for him—for Morton," she said, as she had often said before; but somehow the words did not bring their usual reassurance and consolation.

This, however, was not the time for considerations like these. She remembered with a feeling of impatience that it was Christmas Day, that her house was full of guests, and that her own place was downstairs. She put the letters into her secretary, and rang sharply for her maid. But while she changed her dress, she was thinking of the great solemn dinner before her—the Christmas dinner *par excellence*, like which there was no other throughout the entire year—thinking of Katharine, thinking of the expostulating remarks she had heard that morning, thinking also of the letters she had read, thinking of the entire failure of her scheme, and wishing that she had not so uselessly thrown this apple of discord into the midst of her well-ordered party, but had left it in peace in Mr. Marks's garden.

"What on earth will come of it all?" she said to herself, as she slowly went down-stairs, and the sound of Katharine's voice rose from the back drawing-room, mingled with the rich, deep tones of the organ. Mrs. Annesley knew what sort of faces the ladies in the front

drawing-room were wearing, and she actually felt cowardly about going down to meet them. It would have been strange, and consoling, too, perhaps, if she had only known that, when she laid down her weapons, Fate took them up, and from that time forth ceased not to fight for her.

CHAPTER XVIII.—ST. JOHN.

As time went on, matters, from the ladies' point of view, grew decidedly worse instead of better. Perversely enough, the gentlemen persisted in paying attention to Miss Tresham, in stoutly maintaining that she was pretty, and in finding her very entertaining. No girl of the party could gather a larger circle of admirers round her, or keep them amused for a longer space of time—not even Irene Vernon, with all her beauty. How Miss Tresham managed it, nobody was able to explain; but that she did manage it was, to say the least, amply proved. "She must necessarily suffer by a comparison with Irene Vernon," Mrs. Annesley had said, with profound confidence in her own assertion. What words, then, can describe her dismay when she found that there were others besides Morton who had sufficiently bad taste to find a charm in those gray eyes and that pretty mouth, which Irene Vernon's regular features lacked?

"There is no use denying the fact," Miss Lester said, with a little play of the eyebrows, peculiar to herself, "Miss Tresham throws us all in the shade; and for my part I should like to know how she does it."

Mrs. French, to whom this speech was made, shrugged her shoulders with considerable impatience.

"She does it simply on the strength of being something new," she answered. "Men are such fools about a new face! They talk of the fickleness of women, when the fact is, that they would grow tired of Venus herself."

Whether or not this was a correct solution of the matter, it was at least certain that Miss Tresham made a sensation—a sensation not to be doubted, and which took herself as much by surprise as it could possibly have taken anybody else. She enjoyed it, and entered into it with great zest. As she had told Mrs. Gordon she was fond of pleasure, and here was pleasure of the best kind, mingled with that elixir of admiration which is the sweetest draught that can be put to the lips of youth. Mrs. Marks would hardly have recognized her quiet governess in the bright, handsome girl who laughed, and talked, and sang at Annesdale, and who, all of a sudden, developed a power of attraction that quite carried the young men out of their senses. The young ladies were piqued and puzzled, but they managed to console themselves with their own sworn admirers; while the elders looked on in amazement and indignation, too deep for words. Poor Katharine! If they had only known it, they need not have grudged her this short holiday of natural, youthful enjoyment. Even while her heart was lightest and her spirits at their best, a sudden dark cloud arose, and the sunshine went out of her sky for many a long day.

Rapidly and pleasantly the time flew by. Anybody who has ever been in a country-house of this description, knows how rapidly and how pleasantly time can fly on such occasions, yet how impossible it is to give any exact description of the enjoyment that helps its flight. People, as it seems, are doing a dozen things at once, and they all go to make up an harmonious whole. There are flirting couples behind the curtains of the bay-windows, in the shady recesses of the library, in the hall, on the piazzas, walking over the grounds—in fact, flirting is the chief amusement and grand order of the day. Then, there are groups around the piano, and small card-tables, and billiard-players, and people continually driving up in carriages, and riding off on horse-back; and servants coming and going, and dogs everywhere, and a perfect tide of life flowing here and there, and centring every day around the dinner-table. Usually in the morning, about three or four o'clock, there was an uproar of hounds, and horns, and horses, that roused every sleeper in the house, when all the gentlemen, with the exception of one or two who were considered hopeless sybarites, went fox-hunting—dropping in again, about mid-day, either flushed with success or dispirited by failure, but in either case quite ready to take up their respective flirtations just at the point where they had been left off.

On such a morning as this—a morning when the hunters were out and had not yet returned, and the ladies were wandering about aimlessly or yawning in each other's faces—Katharine sat by one of the

drawing-room windows trifling over some needlework, when Irene Vernon came up to her.

"Are you busy?" asked the young lady, abruptly. "If you don't mind leaving that work, suppose we take a walk? It is a lovely day."

Katharine did not mind leaving the work at all; so she put it down, got her bonnet and shawl, and in a few minutes was walking by Miss Vernon's side out of the front door. They went down the piazza steps together and turned into a path to the right, that, winding down among the shrubbery, soon led them out of sight of the house. Irene gave a sigh of relief when the last glimpse of the chimneys was shut out, and they had a wall of green on one side, and a fair outlook of rolling country on the other.

"I am so glad to get away," she said, frankly. "I lose all patience with those girls; they don't seem to have an idea what to do with themselves when the gentlemen are absent. They mope about, and are *ennuyées* and stupid to the last degree, and all because they are thrown on their own resources for a few hours. It is disgusting!" said the young lady, with an expression of face that quite suited her words. "It is really enough to make one ashamed of being a woman!"

"It is natural, I suppose," said Katharine.

"Why should it be natural?" retorted Miss Vernon, indignantly. "It is not natural at all—it is the way they are taught and trained. Men are not so," she went on, with an impatience that amused her listener. "You never hear of their pining and moping because there are no women about. They like each other's society a great deal the best; and they always take it when they can get it. It is only women who are so absurdly and disgustingly dependent—who can find no zest or amusement whatever in the society of other women. Heaven only knows why! I am sure I would rather be talking to you than to any man of all the party."

"Thank you," said Katharine, smiling. Then she added, archly, "Won't you even make an exception in favor of Mr. Seymour?"

"Why should I?" asked the young lady, carelessly. "He is a good fellow—dear, old Godfrey!—and I have known him all my life; but, excepting for that, he is no more to me than any other man. Is there anybody you would prefer as a companion?"

"Nobody at all," answered Katharine, still smiling. "Indeed, I should be at a loss to think of anybody, unless I chose Mr. Langdon, or Mr. Talcott, or that very singular Mr. Hallam, who makes me afraid he is going to snap my head off every time he begins to talk."

"Or Morton Annesley," said her companion.

Katharine started and gave a keen glance at the face beside her, but failed to read any thing there. Miss Vernon was walking along tearing a geranium-leaf to pieces, and did not even raise her eyes.

"I don't know why I should make an exception of Mr. Annesley," said Miss Tresham, a little distantly.

"I thought he was a friend of yours," answered Miss Vernon. "If I had a friend, I would not speak of him in such a tone as that."

"If you had a friend!" repeated Katharine, a little surprised. "Have you no friend, then?"

"Of my own making, independently of family liking and hereditary connection, and all that sort of thing? Not one. All my life I have wished that I might stand on my own merits and see if I could gain a friend who would like me for myself. But I have never done so, and, indeed, it would be quite useless, for, if I cannot attract people with so many aids to win their regard, what would I do without these aids? I should be simply hated—that is all."

"You are one of the last persons in the world I could possibly have expected to hear talk in this way."

"Because I am pretty and rich? Neither of those facts make me less unamiable or less unpopular. Not that I care for the unpopularity, but I should like to have one or two friends, and I have none."

She made the statement in a quiet, decided tone, and Katharine was astonished, and puzzled, and sorry all at once.

"Miss Vernon," she said, "I am sure you do many people great injustice."

"Of course I am not talking of my own family," said Miss Vernon, "They are fond of me, as one will be fond of one's own flesh and blood, let it be ever so disagreeable. And I am very disagreeable," she added, looking the young governess straight in the face.

"I have really been considering you very charming," said the other, trying to preserve an appearance of gravity.

"Then you are the first woman who ever did so," answered her

companion. "The most of them think me detestable, and, indeed, I don't wonder—my temper is so easily upset, and my tongue is so sharp. I try to keep it under control, but somehow I can't. I don't ever hear you make ill-natured remarks, Miss Tresham; and yet you are not silly either. How do you manage it?"

"I don't know that I often feel inclined to make ill-natured remarks; but, when I do, I don't give way to the inclination."

"And I always give way. Then, people think, 'How hateful she is!' and, honestly speaking, I don't blame them. As for my admirers, some of them like me for my face, and some for my fortune; but, if I were to try forever, I could not secure half as much genuine admiration as you have obtained, without trying, during the last few days."

"Miss Vernon, you do yourself as much injustice as you do other people. You are clever, and frank, and unaffected—what more could a woman wish to be?"

"I am sharp, and haughty, and ill-natured," said Miss Vernon, summing up her bad qualities with an utter disregard of this attempt at consolation. "If you knew me long enough, you would be repelled like everybody else. I really believe Godfrey Seymour is the only person who knows all my faults and likes me in spite of them; while I like him—poor, dear fellow!—as if—as if he was a great Newfoundland dog."

"No better?"

"Not a bit better."

She spoke decidedly, and Miss Tresham could not help feeling a little sorry for the gentleman who was liked in this canine fashion. "He deserves something better," she thought; but it was none of her business to say so, and they walked on silently, the bright winter day lying in still beauty all around them, birds singing over their heads, and a faint, purple mist softening the distant hills like a harbinger of spring. Again it was Miss Vernon who spoke first, and spoke abruptly:

"Miss Tresham, do you know it is a plan of our respective relations to marry Morton Annesley and myself to each other?"

"I—" Katharine was quite taken aback by this unexpected question. "Yes, I have heard something of the kind."

"A nice idea, isn't it?" said the young lady, with a smile that was rather too bright to be natural. "I don't think I ever heard any thing more absurd. Frank French is my cousin, you know, and so Adela and Flora took it into their wise heads that Morton and I would make a good match, without any regard to the trifling fact that neither of us ever had any fancy—any special fancy, that is—for the other. Of course, he was repelled by my temper, as everybody is, while I—well, I never thought of him at all. I should have been a fool if I had, considering that he never was more than civil to me. He is a charming gentleman, though," she said, looking at Katharine, "and any woman whom he loved would do well to marry him."

They were almost the same words that Mrs. Gordon had spoken, little more than a week before, and, hearing them thus the second time, they filled Katharine with a sudden sense of surprise and amusement, which it is impossible to describe. She understood perfectly what assurance it was that Miss Vernon wished to convey to her, and the humor of the situation overpowered for the moment every other consideration. It was strange enough that his own cousin, a woman steeped to the lips in the traditions of her class and the pride of blood, should have advised her to marry Morton; but for this young beauty, this girl, who, according to the vulgar melodramatic idea, should have been her "rival," to echo such advice! A comic vision of Mrs. Annesley's horror rose before Katharine, and almost made her laugh.

"I quite agree with you," she answered, as quietly as she had answered Mrs. Gordon. "The woman whom he loved, and who loved him, would do well to marry Mr. Annesley. But how is this? We have come round to the gates."

"By a longer route than the carriage-drive, but one just as sure," said Miss Vernon, smiling. "See! there is some one coming in. Shall we turn and go back the way we came?"

Before Katharine could reply, Spitfire, who had lately taken quite a fancy to her, and had condescended to follow her out, made a wild rush at the figure just entering the gate, barking with a degree of fury almost incomprehensible, considering the size of the body from which the sound proceeded. Notwithstanding his insignificant appearance, he quite startled and overpowered the new-comer. This person—a

tall, slender, well-dressed man—backed against the gate, and began kicking at his assailant with one foot, which proceeding, of course, irritated Spitfire to the extreme of canine wrath.

"Call him off! call him off!" cried Miss Vernon to Katharine. "He will bite the man, or the man will hurt him, and that would make Maggie furious, you know. Do call him off!"

Katharine called and called again; but Spitfire, who did not obey his mistress, was certainly not likely to obey her. He danced round the stranger like a dog that was possessed, and gave no sign of heeding. So Katharine went forward and addressed the other combatant, who kicked quite as furiously as Spitfire barked.

"Pray don't do that!" she cried. "He won't bite, I assure you, and—"

She stopped short. Miss Vernon, standing at a little distance, looking on, saw her suddenly put her hands to her face, and utter a low cry. The kicker dropped his foot, and, disregarding Spitfire, made a quick step forward.

"Katharine!" he said, eagerly—"my dear Katharine!"

But at the sound of his voice the girl raised her face, all white and drawn, and held out her hands, not to welcome, but to keep him back.

"You!" she said, hoarsely; "you!"

"Yes, I," he said, so much the more self-possessed of the two that it was evident this meeting was not entirely unexpected on his part. "I thought you would not be unprepared. I wrote to you not long ago. Did you not receive my letter?"

She made an effort to speak before she succeeded; then, with a sort of dry gasp, the words were articulated:

"Yes, I received it; but I thought—I hoped—that is, I was fool enough to think—to hope—that you might care for me sufficiently to leave me alone."

"To leave you alone, my dear Katharine?" His face expressed the liveliest surprise. "Am I not your natural protector, your—"

"Hush!" she said, so fiercely that he absolutely started back. "Let me hear none of that cant! What do you want with me, now that you have come?"

"I must see and speak to you," he said, a little sulkily. "Will you take me to the house?"

"To the house? to be asked who and what you are? My God, no! Wait here a moment; I will speak—"

She left him, and hastily followed Miss Vernon, who, with well-bred consideration, had walked out of ear-shot of the conversation. Hearing Katharine's step behind her, she paused and turned.

"So you found an acquaintance, Miss Tresham?" she began, with a smile, when the terrible pallor of the girl's face startled her. "Good Heavens! what is the matter?" she cried, in sudden alarm.

"Nothing—nothing," answered Katharine, striving to force a smile that only made her look more ghastly; "only I—I am obliged to ask you to return to the house without me. This gentleman is an acquaintance of mine, and I must stop to speak to him. You will excuse me, I am sure."

"Certainly I will excuse you," said Miss Vernon, trying hard to keep her surprise out of her voice. "But, if you will pardon me, had you not better take your friend to the house? I am sure Mrs. Annesley—"

"I cannot do that," said Katharine, nervously. "I could not think of taking such a liberty. Then, no privacy is possible in the house, and I must see this gentleman privately. My dear Miss Vernon, if you will only be kind enough not to say any thing—"

"Of course, I shall not say any thing," interrupted Miss Vernon, hastily.

Then she called Spitfire, and, without a single backward glance, disappeared down the path.

When the last flutter of her dress vanished from sight, Katharine turned and beckoned to the man, who was still standing where she had left him. He obeyed the signal with alacrity; and, as he walked quickly forward, she moved on in front of him, and did not pause until she had reached the most secluded part of the grounds—a deep, bosky dell, where a little brook ran, and where they were entirely safe from observation. There she turned and faced him—white, but by this time composed and rigidly braced, as it seemed, for any thing.

"Well," she said, with icy coldness, "what is it?"

"By Jove! my dear Katharine, your American sojourn seems to have improved the warmth of your affections," said her companion,

with a smile. "Is this the only greeting you have for me—me, who have come so far to see you?"

"St. John," she cried, passionately, "let me hear no more of this! I cannot, will not, bear it! You have already worked me all the harm that it is in the power of one person to inflict upon another. You are here now, in defiance of your most solemn obligations, to injure me further; and yet—and yet you dare to talk like this! For Heaven's sake, let me hear no more of it!"

"That is just as you please," said he, with a relapse into sulkiness.

Nothing was said after this for several minutes. The two figures stood silently facing each other—the leafless trees and dark evergreens all around them, and the limpid stream flowing at their feet. Katharine's bright winter costume made a beautiful "bit" of color on the somewhat sombre landscape—her companion being, in appearance at least, less interesting. Yet he was not an ill-looking man; on the contrary, many people would have called him handsome, and been justified in doing so. He was, in age, somewhere between twenty-five and thirty—certainly not younger than the one or older than the other—he had a slender, elegant figure, and a dark, well-modelled face—a face with a good complexion, dark eyes, thin lips, and a painfully-narrow forehead. The man was not a sensualist—no man with that mouth could have been—but a physiognomist, looking at him, would have said that he was selfish and unscrupulous, and in so saying would not have gone very far wide of the truth. It was Katharine who spoke first.

"You asked me if I received your letter. Did you get my reply?"

"It was impossible for me to have done so," he answered. "I left England immediately after writing that letter. Was there any thing of importance in yours?"

"Nothing," she answered, drearily. "I asked you to let me alone—that was all, I might have known how useless that was—I might have known that you never did, nor ever will consider any one but yourself. How did you find out where I was?" she added, turning upon him suddenly. "You gave me no explanation of that, and I don't understand how it was."

"There are a great many things you don't understand, my dear Katharine," said he, in a patronizing tone. "This must remain one of them. I found out where you were just as I should find it out if you were foolish enough to go and bury yourself and all your fine talents in the South Sea Islands. I have ways and means—believe me it is useless to attempt to hide from me. I thought I should never reach this place," he went on, with a shrug of the shoulders, "and when I at last arrived, and thought all my difficulties were over, I went to the woman with whom you live, and she told me—"

"What!" cried Katharine, starting. "You have seen Mrs. Marks?"

"Certainly I have," answered he, coolly, "and a dozen or so children, besides. It was she who told me you were here. Did you think I found it out by instinct?"

"And what did you tell her to account for your inquiries?" asked Katharine, almost wringing her hands. "Oh, St. John, you surely have not told her—"

"Nothing at all," said he, roughly. "Don't make a fool of yourself! Am I the devil, or do I look like him, that you should be so afraid of claiming connection with me? I told the woman—she looks like a respectable cook, by-the-way—that I was a friend of yours, from England. She was evidently very curious, but I thought that was enough for her."

"And what am I to tell her when I go back, and she speaks of you, as she is sure to do?"

"Tell her that I am your brother."

"I will not," cried she, indignantly.

"Well, whatever lie may be convenient, then. I am ready to play any part. We might compromise on uncle, since you object to brother, for I am afraid I am rather young to attempt the rôle of father."

"St. John, be serious," she cried, with something like a sob in her throat. "Don't you see that I cannot bear such wretched trifling. Oh! if you had ever cared for me in the least degree, you would never embitter my life like this!"

"If you had a grain of common-sense, you would not make such a fuss over nothing," said he, impatiently. "Have I not a right to

see you when and where I choose? I will go up yonder among your new associates and assert it, if you say so."

"If you dare!" said she, blazing out upon him, with sudden indignation. "Yes, if you dare! You have tracked me down, and I am willing to buy my peace of life at any price you choose to ask—short of this. St. John," she said, sitting down on a rustic seat near by, "this is too much for me. Tell me at once what you want—and—and let me go."

He walked away from her for a short distance, biting his under lip almost savagely; then he turned abruptly, and came back.

"You know what I want," he said. "It is always the same thing—the cursed need of money. Can you let me have any?"

"I can let you have the most of my two years' salary, which is in Mr. Marks's hands, if you will go away then, and leave me in peace."

"So you only care to buy my absence," he said, with a dark cloud coming over his face.

"Ask yourself how I can care for any thing else," she answered, sadly. "But such as the money is, you are welcome to it. I saved it for you, and meant to send it to you—so you are welcome to it."

He moved away, and took another turn—came back again and caught her arm.

"I would not touch a penny of it, if ruin was not staring me in the face," he said. "But, as it is, I see no other chance—not one."

"Has that man—that Fraser—thrown you off, then?"

"Curse him, yes—completely!"

"And you have only me?"

"I have only you, or you may be sure that I would not have come for any such greeting as this has been."

She rose suddenly and held out her hands to him.

"Forgive me, St. John," she cried, with a sudden pathos in her voice. "I did not understand. I thought you had come merely to disturb and make me wretched. I will do any thing in the world for you that I can—you know that. If you say so, I will go away with you, and we will try to live together, and to begin a new life, in some new place."

"And drag each other down, like a couple of millstones. That would be wise, indeed! No, I will only be cur enough to rob you of all your savings, and then I will go away and leave you in the peace you talk so much about. When can you let me have the money?"

"To-morrow—I cannot see Mr. Marks to-day. I will meet you in Tallahoma, or else you can come back here. I will show you a private way to enter the grounds, and this is a very retired place. I shall have to write a note. I suppose you are at the hotel?"

"Yes—registered as Mr. Johns. Don't forget that."

Katharine flushed. She had an instinctive horror of an alias, and this one seemed to her so unnecessary. "Who would have known the other name here?" she asked.

"Nobody, probably; but I believe in precautionary measures, always. Well, I shall look for a note to-morrow, appointing a place where I can see you again. I can tell you, by-the-way, that you are putting yourself in a very bad position by this assignation business. It would be much better, and much safer, to take me to the house yonder, and present me as a foreign friend."

"I cannot—I will not!" she cried. "It might be better, perhaps, but I would rather run more risk, and meet you where nobody has a right to question who and what you are."

"Just as you please. It is your own affair," said he, carelessly. "Are you coming to show me the private entrance you spoke of? I am sure to meet somebody about those large gates."

She went and showed it to him—quaking as she did so, lest some one should meet them; and when he was once safely beyond the boundary of the grounds, she gave a deep sigh of relief, and sped like an arrow toward the house.

[TO BE CONTINUED.]

BLINKEY.

A TALE OF THE SOUTHERN PINE-BARRENS.

A DISREPUTABLE-LOOKING personage, certainly!—as he sat there, awkwardly balanced upon the little gray donkey, with its disproportioned head, and meagre, half-starved quarters. I thought, indeed, that I had never seen a "harder" specimen of humanity. He

was tall, rawboned—in fact, a skeleton! The knuckles of his hand, closed about the reins of tarred rope, resembled huge, glistening knobs carved out of some substance as solid as stone. His forehead, slightly covered by a bloody handkerchief, was protuberant and angular to that extent that it impressed one with a sense of ghastly incongruity, a feeling as if he were contemplating a skull long due to the church-yard. This unsavory idea was intensified by the extreme hollowiness of the creature's eyes. They glittered and snapped continually in caverns of deepest gloom, under eyebrows shaggy, white, unresting, but, strange to say, with no visible lashes whatever. A great, tangled, dirty-gray beard rolled over a chest of Hercules (or what once must have been such), and some of the strands of hair, twisted into a string, were tied around the stem of a gigantic clay-pipe, which bobbed and dangled across the remnants of a coarse cotton shirt. The creature's *pants*—for of coat he had none—were truly of the order of "inexpressibles." They were so patched and overlaid, so seamed, and stitched, and variegated, horizontally, vertically, and transversely, that little if any of the original garment remained; while his cow-skin shoes, which might have fitted Goliath of Gath, added much to the unpleasant *grotesquerie* of his appearance. The extreme pallor of his complexion, especially noticeable in the drooping corners of the loose, half-opened mouth, was lit up startlingly by the more than Bardolphian ruddiness of a nose, into which all that remained to the man of genuine vitality seemed to have retired and concentrated itself.

I recognized this person as the *bête noire* of the entire neighborhood. His real name was Newton; but, the rustic mind being fond of nicknames, he had—from a peculiarity already mentioned—been dubbed "Blinkey," and by that name alone was he known, and, in a certain unenviable sense, admired, by a large circle of bumpkins. His story was not altogether a common one.

Once, the toothless, dilapidated scarecrow we have sketched had been a reputable young farmer, owning six hundred acres of the best corn-land to be found among the "pine-barrens," besides a fruitful orchard and considerable capital in stock. Shrewd, intelligent, thrifty, better educated than the ordinary "sand-lappers," and possessed (it was hard to believe it afterward) of a handsome, manly person, Edward Newton courted the prettiest girl in the county, who also happened to be the cleverest, married her despite the rage of a score of rivals, and carried his wife to "Berryford," where, in the cosy farmhouse, they lived a contented and tranquil life for many years. By hard, persistent labor, and sagacious manipulation of the soil, by drainage and the moderate use of fertilizers, Newton vastly increased the value of his land, and was just beginning to take his place as the rich squire, the agriculturist, *par excellence*, of the neighborhood, when an event occurred which wofully and forever changed his prospects.

One autumn morning the farmer was invited to a barbecue. The occasion was political and exciting, and the *locale* of the feast convenient. So Newton went, to be deafened for hours with stump-oratory, or besought by some maudlin statesman in embryo to "come up to the salvation of the country." Bored and weary, the luckless fellow took refuge for the first time in the whiskey-bottle! He got excited, elevated, tipsy, and at last furiously drunk. The liquor, instead of stupefying him, seemed to lend tremendous strength to his whole body. He felt like a Titan, capable of sustaining the weight of Atlas on his shoulders. His superfluous energy and power must be vented somehow. Naturally, therefore, he quarrelled with his best friend, provoked him to a fight, and thrashed the poor fellow until his nose looked like a magnified blue-bottle, and his eyes had wholly withdrawn themselves from public view. Exhilarated to a yet higher pitch by this benevolent triumph, Newton mounted his horse and rode homeward at a killing pace. Along the avenue to the farm he met his wife, who was out walking with his two pretty daughters.

Reining up as quickly as possible, he called her to his side.

Astonished at her husband's unusual condition, and not comprehending what he wanted, the wife did not move. Upon which Newton turned back to where she stood, pale and frightened, seized her about the waist, and lifted her bodily into a seat before him. Then spurring his horse again into a run, he attempted to make him leap the gate of the enclosure around his house. The animal did not refuse the leap, but he failed to clear the upper bars, and, rolling head-foremost along the turf on the other side, not only threw his riders, but crushed

them. Newton, little hurt, staggered at once to his feet, but the woman was killed outright. Her neck was broken!

They say that the farmer, when made fully aware of this result of his drunken folly, neither spoke nor wept. He simply walked home and went to bed. There the doctor found him on the next morning in a condition which seemed cataleptic. With wide-open, staring eyes and a rigid frame, he remained in this state for many weeks, taking no nourishment but what was forced between his lips. As quietly as he had gone to his bed, one day he left it! But the change in his appearance was fearful. His face resembled a parchment mask; his eyes, deeply sunken, had acquired that twitching, convulsive movement which subsequently suggested the nickname Blinkey, and his whole mien betokened an utter, stony hopelessness.

The very first thing he did was to send for a barrel of whiskey, which, set on end in the parlor, became thenceforth poor Blinkey's most familiar friend, or rather fiend!

There are some temperaments, says De Quincey, to which opium is as fire to tow. Likewise there are temperaments that, having once succumbed to the diabolic glamour of alcohol, can never again free themselves from the degrading spell.

Blinkey's, doubtless, was one of these, and, moreover, in his case remorse was added to a constitutional temptation.

Of course, he grew worse and worse with the progress of time. His business was utterly neglected; his lands ran to waste.

Of his fine stock of cattle, every head was sold at a ruinous loss. He kept, at certain seasons, open-house for all the blackguards and scamps in the county. With one of these, a good-looking, raffish, unprincipled adventurer, his eldest daughter eloped, carrying with her a large amount of money which the father had carelessly left within her reach.

Year by year Blinkey's property dwindled. Finally, he encroached upon his capital, and simultaneously took to gambling.

Needless to observe that his ruin was now consummated. Berryford house and Berryford lands were both brought to the hammer. Long previous to this, however, he had driven his remaining daughter from him with blows, because she, apparently a better girl than her sister, had refused to countenance an abandoned woman whom Blinkey had tried to force upon her society.

Ejected from the dwelling, no longer his own, the miserable sot retired to a log-cabin in the woods. Some valuables he managed to carry with him, for, during a year and more, he had the means of procuring his favorite liquor in seemingly-unlimited quantities. A fouler hole than that hut in the forest never existed on earth. Thither his female companion had followed him, and the two wretches would booze, and babble maudlin nonsense or bawl blasphemies until the superstitious country-people grew afraid of the place, declaring that the woman was a witch and the man a sorcerer, if not something worse.

Nearly eighteen months had passed since Blinkey had sought refuge in solitude, when a "track-raiser," or railroad workman, going after sunset to his home, found the dead body of Bet Lukin—as Blinkey's mistress was called—in a thicket near the latter's cabin.

Her throat was cut, and there were shocking bruises about her head and shoulders. Blinkey was arrested without delay, and in due time tried for murder. But the prosecution failed to prove him guilty, and he left the court-house free in law, but morally convicted of the crime by the judgment of all present.

Thenceforth, no wild beast, dangerous and pitiless, could have been more fearfully shunned by the "sand-lappers"—his neighbors—than this lost, lonely, miserable being. Not only his temper, but his powers, were supposed to be infernal. Did a cow contract some mysterious disease, and die, Blinkey had bewitched her; was a mule or horse incapacitated for labor, Blinkey was sure to be somehow at the bottom of the difficulty; did a sow lose her pigs in a manner at all unusual, who should be made responsible but Blinkey? Over matrons in a delicate situation, it was confidently asserted that he exercised at will the spell of "the evil eye." Had not two children with hare-lips, and a baby deficient in the orthodox number of toes and fingers, been born within a few months of each other, not a mile from his pine-wood den?

The people would have killed the monster, had they dared; but, not daring, they supported him instead. No farmer's wife ventured to refuse him food, when he came a-begging; and the stores of butter, eggs, bacon, milk, and honey, which he procured in virtue of his

wickedness, were sold by him, and the proceeds applied to the purchase of his favorite poison.

Such was the history, as I had heard it many a time, of the desolate, detested old man, who, mounted upon a mangy-looking donkey, and clothed in his mendicant's rags, rode up to our cottage-window upon the bright May morning with which this sketch begins.

The greeting I gave him was the reverse of cordial; but Blinkey, nothing daunted, opened his beggar's batteries on me with a whine that would have done honor to the training of the adroitest "professional" of his class in Cordova or Seville.

Shrewdly regarding me as out of the pale of those whom he could deceive or frighten, he appealed with the most loathsome servility to my compassion.

"What do you want?" I inquired, roughly—"any thing to eat?"

Oh, no! He had been sick; his stomach was *bad* ("not to be wondered at," I thought, "after fifteen or twenty years that might be counted as one long period of intoxication"); and he wanted a dram, just one dram, of whiskey.

"O Lord!" he howled, apparently in real pain; "I'm fit to perish, Mr. —, for a dram!" And Blinkey's watery eyes, farther down than ever in their sullen sockets, winked and twitched horribly. The truth is, I had no whiskey to give him; otherwise, I should certainly have granted his request, because I looked upon him as irreclaimable.

My assurance that there was no liquor in the house, he met with an evident and utter disbelief. He simply redoubled his importunity—conduct which provoked me to order him at once from the premises. Then Blinkey flew into a rage, and *such* a rage! It was almost *epic* in its violence and evident profound sincerity. Does the reader recall Charles Reade's description of the anger of Ghysbrecht van Sweeten, the Burgomaster of Tergou, when baffled in his plans, and insulted by the rough soldier Martin Wittenhaagen? Here is a part of it:

"The choleric old man was driven into a fit of impotent fury; he shook his fist at the soldier, and tried to threaten him, but could not speak for rage and mortification; then he gave a sort of screech, and coiled himself up in eye and form, like a rattlesnake about to strike, and spat furiously upon Martin's doublet.

"Once in the saddle, he seemed to gather in a moment unnatural vigor, and the figure that went flying to Tergou was truly weird-like and terrible—so old and wizened the face, so white the streaming hair, so baleful the eye, so fierce the fury which shook the bent frame that went spurring like mad, while the quavering voice yelled, 'I'll make their hearts ache! I'll make their hearts ache! I'll make their hearts ache! all of them—all!'"

Now, in its general outlines, this is an admirable picture of Blinkey's madness. He foamed at the mouth, choked and cursed alternately, and his figure, while he forced the donkey down-hill at a pace I never could have dreamed within the power of that decrepit beast, was the figure of the incensed burgomaster over again—*plus*, of course, the filthy rags.

Revolting as the incident seemed, it had its ludicrous side, at which I was quietly laughing, when our excellent washerwoman—who had seen Blinkey's exit, and heard his vituperations from afar—came up with a very pale face, and the clothes-basket quaking upon the top of her head.

She seemed to think that something terrible would happen to ourselves or our family. Never had she beheld Blinkey so infuriated; and Blinkey, if not the devil himself, was a very near relation of that evil-minded and malignant personage.

On the night following the encounter mentioned, I was seated alone in the library, puzzling over some complicated notes of an historical article which had been sent me for revision by a friend, when, about eleven o'clock, my notice was attracted by a great cackling of geese and clucking of hens in the poultry-yard. Supposing that Master Reynard was at his old nocturnal tricks, I took a gun from the corner, gently opened the back-door, and went into the yard to reconnoitre. A somewhat hazy moonlight made all objects indistinct; but, as I approached the scene of disturbance on tiptoe, both barrels cocked, I saw what appeared to be a human figure, bending over the hen-coops, and busily engaged, no doubt, in appropriating our bantams or high-bred shanghais. This spectacle provoked me, as only the year before our farmstead had been devastated by negro thieves. "And now," thought I, "the sly game has commenced again; but I'll make an example at once, and thus nip the mischief in the bud."

So I crept nearer to the busy figure, intending to surprise and capture the marauder, or, if he attempted escape, to use my gun *sans cérémonie*. It happened, however, through lack of caution, that the gun got entangled in the bushes, and the right-hand barrel was discharged accidentally in the air. To my amazement, the thief—for a thief it evidently was, since I could now detect a large canvas bag, into which the fowls were being hastily thrust—so far from displaying any fright at the loud discharge so near him, coolly proceeded in his work, as if nothing had occurred. Instinctively, without any further attempt at concealment, I rushed up to the coops, and was just on the point of grasping the culprit's shoulder, when the person turned, saw me, and, with a flash-like quickness, ran away.

It proved to be a *child*, a diminutive creature, but swift as any deer. I shouted at the top of my voice, commanding it to stop; but vainly, and, of course, to shoot at a child was an impossible barbarism.

As luck would have it, young nimble-legs, scudding away like the wind, encountered a deep hole, into which it disappeared so suddenly that I rubbed my eyes with a feeling of bewilderment akin to that of poor Caleb Balderstone, when the Laird of Ravenswood vanished in the Kelpies Flow. But the opportunity was not neglected. Hastening to the hole, I dragged out into the moonlight as queer a little object as ever, perhaps, wore the shape of humanity. Judged by its form, the creature might have been ten; judged by its face, it might have been a hundred years old. The latter was seamed, wrinkled, and puckered up, with a dead, dirty-white complexion, which looked ghastly by the uncertain light; the eyes, small, bright, and eager as those of a marmoset, examined my every movement and expression with a sort of animal watchfulness, a keen suspicion, not for an instant to be diverted. Upon its head, a man's slouched hat partly hid the long coarse locks of black hair; but, its only garment being a tattered homespun frock, I concluded that this odd little being must be a female.

"Have I been given over to a visitation of scarecrows," I reflected—"Blinkey this morning, and this anomalous little being to-night?"

"Who are you?" I asked, after a minute's pause, resting one hand on the prisoner's shoulder, and holding her firmly in front of me.

There was no answer; only the keen eyes grew keener, their watchful expression more vigilant.

"Who are you?" I asked again, in a louder tone; "and where do you come from?"

Silence still—but any thing like the increased sharpness of regard, the bright though fearful anticipation in those wonderful eyes, as if a sudden blow or some act of violence on my part were momentarily expected, I had never seen before, except in the eyes of some hunted beast or of a dog who awaits punishment for his misdeeds.

"Obstinate little devil!" I muttered, half angry and half amused. "Where could she have dropped from? The moon, perhaps. Certainly, she does resemble the portentous race of dwarfs who inhabit that satellite, if Edgar Poe's Dutch *savant*, who visited it, is worthy of belief."

Then, in a louder tone still, but as conciliatory as I could make it, "Don't be afraid, child," I said, "nobody shall hurt you; only tell the truth. Who sent you here to steal, and what's your name?"

I might as well have addressed a juvenile ape! Nothing responded but those weird, restless eyes. Growing impatient, I pulled the girl slightly toward me and shook her by the shoulders, though not violently. Whereupon she uttered a sound which, whether intended as a cry of rage or terror, actually chilled my blood. It was a sort of hoarse, inarticulate moan, deep and prolonged, and dying off into a wailing *diminuendo*, wholly indescribable.

Shocked and startled, I attempted no further conversation with the uncanny little savage, but took her to the kitchen, which was empty—our servants being absent—showed her a bed in one corner, and then, having secured the window outwardly and locked the door, left her securely imprisoned for the night.

The next morning early I paid a visit to my captive, but she was gone! Her exit had been made neither through the door nor the window—both of which remained secure—but by means of a plank or two ingeniously removed from the rickety, ill-constructed floor. My curiosity had been so thoroughly awakened as to who and what the little girl-thief could be, that her clever escape, instead of making me laugh, as it would have done under ordinary circumstances, provoked and annoyed me.

That day at breakfast I related the previous night's adventure to my wife.

"How very odd!" she exclaimed. "I must have been sleeping with unusual soundness, or of course the report of your gun would have roused me. My dear, you must make inquiries; you *must* find out who this poor little wretch is!"

"To oblige you," I replied, "yes—but the trouble will be wasted; I'm convinced that a band of trolls or fairies are somewhere in the neighborhood, and that the 'poor little wretch,' as you call her, is one of their unchristian company. Perhaps we had best leave such grewsome folk alone."

"Nonsense!" cried the lady behind the tea-urn, "if you don't make inquiries, why, then, I will. Ah!" (with a burst of excitement), "here comes the very person who can clear up the mystery. How lucky!"

And she pointed to the garden gate, which was being opened at the moment by an individual who knew and was known by every man, woman, and child, in the county—no less a dignitary than Jem Tudor, or "Buggy Jem," the pedler.

We have spoken of the "sand-lapper's" fancy for nicknames. Every man who had the slightest peculiarity of manner or person, was accommodated with a handle to his name in accordance with the idiosyncrasy. If nothing distinctive existed in these respects, the popular ingenuity took account of a man's goods and chattels, and was pretty sure to find among them some suggestive object. Thus, as Jem Tudor had, at a remote period of his career, owned a small "buggy," in which he drove about peddling, "Buggy Jem" was decided upon as his distinguishing title, and "Buggy Jem" he would assuredly be called to the end of the chapter.

He came in now with his pack—a short, wiry, bustling fellow, quick of eye and motion, with a ceaseless habit of elevating and depressing his shoulders after the fashion of the piston of a steam-engine, and a general terrier-like air of snuffing his way into a good stroke of business.

"Good-mornin', kurnul," said he; "good-mornin', Miss ——. It's mighty warm and dry now, ain't it? I've been wishin' for the last four mile to be shet of this here all-fired pack. It's heavy as a breedin' sow (beg pardon, Miss ——), and I'd be right pleased now to lighten it. Want to trade, kurnul?"

I shook my head, knowing too well the quality of "Buggy" Jem's goods to venture upon any commercial dealings with him. But my wife was less scrupulous, having a set purpose in view, and not unwilling to pay Jem if he allowed himself to be duly pumped. So the pack was unslung and opened upon a side table, displaying the usual assortment of cheap calicoes, bright but coarse stuffs, and gilded jewelry.

Pretending to examine these, madame—whose feminine tact and shrewdness upon great occasions and small I have had ten years' opportunity of admiring—rapidly questioned Jem as to his acquaintances in the vicinity.

"Did he know of any poor people who had in their family an odd, stunted little girl who was trained to steal; a cunning, quick-footed creature, particularly fond of appropriating fowls, eggs, etc.?" "Buggy Jem" considered. He assumed an expression profound as that of Talleyrand revolving in the depths of his mind the fate of Europe. But "No," he replied at length. "He couldn't say that he knew of any such family."

I then struck in and told him of my night's adventure, minutely and perhaps—for the fellow's wide-opened eyes of wonder tempted me—with one or two startling additions.

I had by no means finished, when he snapped his fingers exultantly, and declared that he knew "that darned little creatur' like a book!"

"Tell us all about her," we both demanded in a breath. "Buggy Jem" felt in his pocket, extracted therefrom a huge plug of tobacco, which he consigned to a mouth of corresponding size, and favored us with a long story, full of digressions and circumlocutions, the substance of which was this:

Six months ago, a party of wagoners had encamped one night in the pine-woods, not far from Blinkey Newton's cabin. Some hours after they had left, the following morning, Blinkey, passing accidentally by the embers of their fire, saw seated in the ashes a ragged little child, who was rocking herself to and fro and making unintelligible moans and strange gestures with her arms. He asked in his rough way "what ailed her," but could get no answer; so he whipped up

his mule, and was riding away when the child, sputtering and jabbering "more like an animal than a human," seized his stirrup and entreated, by unmistakable gestures, to be taken under his protection. Whether Blinky was touched by being for once voluntarily sought, or whether an unwontedly soft mood possessed him, who can say? but he took the girl in his arms and carried her to his uncouth home, where ever since they had lived inseparable. Abroad too she was continually with him, his very shadow in fact; but as nobody had ever heard her utter a comprehensible word, and as the oddity of her appearance bordered on the ape-like and horrible, all sorts of superstitious rumors were current as to who the creature was and whence she had come. Some swore it was what the Scotch used to call a "brownie," others said it must be a wood-goblin; only one old farmer, shrewder and more practical than his associates, "pooh-poohed" such reports with contempt, declaring the girl to be nothing more than a *daf-mule*, deserted in all probability by her parents, to whom she (poor thing!) had proved a burden. "Well done," I exclaimed, when this theory was broached, "You may stop there, Buggy; you've hit the true nail on the head at last!"

"Do you think so?" he inquired, dubiously, disappointed, it was plain, at so practical and commonplace a solution of the puzzle.

"Think so? I'm positive," said I; "every thing confirms that lucky guess. Indeed, now I remember, 'tis difficult to understand how I failed to come to the same conclusion myself." Depressed by finding the glare of the supernatural thus quenched, like a flaring rocket converted into a stick, Buggy Jem would have departed inconsolable, had not my wife taken pity upon him and purchased from his stock a number of articles of no possible present or future value to anybody. These she put aside with an air of solicitude which said, "Such treasures are beyond price!" The pedler was comforted, and went away whistling like "three-and-twenty blackbirds" rolled into one!

The next two or three weeks were passed in hard work upon the farm, and Blinky and his *protégée* had been forgotten, when one morning I found that our poultry-yard had been invaded with a vengeance! Not only were a dozen of the best breeds of our imported fowls missing, but as many more lay dead upon the ground, their necks scientifically twisted and their feathers scattered in every direction!

It flashed upon me after an instant's reflection that Blinky was responsible for this cruel devastation. He had doubtless been aided by his adopted child or goblin (who, by-the-way, had been fitted by general consent with the title of "Scrub," because, in her ragged scragginess, she was not unlike the common *scrub-oak* of the sand-barrens). At all events, I determined to find out what the worthy couple in question were doing. Therefore, a little after sundown that evening, I rode cautiously toward Blinky's cabin, and, having secured my horse in the surrounding wood, I peered about the premises, seeking information. While I lingered and looked vainly for some sign of life without, there flashed between the cracks of the log-hut a sudden ruddy light, and at the same moment a strain of music, inexpressibly sweet, delicate, and mournful, floated from that rude "shanty" out upon the "gloaming."

Approaching still nearer, I glanced through the interstices of the building, and beheld so *outré* and novel a spectacle that I couldn't help wishing that Doré was with me to perpetuate its details by his eccentric pencil. Seated in the blaze of a huge pine-knot, the inevitable whiskey-bottle within easy reach upon a deal table, was Blinky Newton, his expression a shade less revolting than common, while he played upon the violin with a skill, pathos, and harmony, that took me wholly by surprise. In better days, he had been fond of that instrument, and even the weight of the awful degradation now oppressing him could not destroy his passion for music.

He wielded his bow with marvellous effect, the hard lines of the ruined face softening by degrees, and growing almost tender at the humanizing tones his own hand elicited.

And crouching upon the floor, her chin supported on Blinky's knee, her weird, eldritch eyes raised to his, with a look half-inscrutable, half-devoted, the poor little dumb outcast Scrub could be seen, striving apparently to read her patron's thoughts and to catch the sounds which, by a sort of instinct, she knew he was making upon that odd wooden instrument at his shoulder. Once or twice she regarded the violin with an envious impatience, but, so subtle and evanescent was this expression, that scarcely could one detect it before, like a swift-

flitting cloud, it had passed, leaving the gentler look undarkened and undisturbed.

A coal-black cat, of gigantic proportions and baleful gaze—the completest representative conceivable of the traditional witches' cat—glowered from a corner of the hearth, lifting his ugly head occasionally, and arching his back, as if in protest against any thing so beautiful as his master's musical performance. "What a scene of moral contrasts!" I thought. "Harmonies, the truest and the purest, proceeding from that low, corrupt, unspeakably-depraved being, surrounded by evidences of his fall—sounds of heaven rising out of hades!"

Perhaps it is not possible for any man, though a prince in wickedness, utterly to destroy or stifle conscience. At all events, while I curiously watched him, some stray tone of his violin startled Blinky and overcame his softer emotions.

The bow drooped, and was then dashed from his hand; he began to shake and tremble violently from head to foot; a strange rage and terror possessed him. Glancing round with dilated eyes, he stared into the corners of the room, where fantastic shadows from the fire-light flickered and danced grotesquely. These shadows maddened him. To his diseased fancy they were evidently fiend-like. With a muttered, quivering curse he rose stiffly up, more like some figure moved by galvanism than the human will, and, thrusting his arms and hands outward, with the gesture of one who would keep off a mortal enemy, he slowly retreated sideways toward the door. The veins on his forehead were purple-black and swollen. Every nerve and muscle shivered in agony. His countenance was a living, writhing, palpable nightmare. But, as he glided rather than walked across the floor, Scrub, who had risen too, following with painful intentness his every motion, rushed on a sudden before him, uttering that deep, inarticulate, thrilling cry of hers; she seized his uplifted hands, clasped and kissed them with frantic affection, and besought him by her looks, as plainly as if she had spoken, to be quieted and to take comfort. Here was one in the world that loved him still! Blinky's haggard and haunted face relaxed. He comprehended her tender pantomime, and, quickly gathering the uncouth little comforter to his heart, sobbed and wept over her like a woman.

I turned quietly away and left the place. Somehow my eagerness to convict Blinky of theft, to arrest him, as it were, red-handed (for I felt convinced still that he had my poultry secreted on his premises), had completely evaporated; a profound compassion was the sole feeling I experienced now.

For a long time after this adventure I saw and heard nothing of the oddly-assorted pair. But, on a dismal afternoon in October, I was again honored by a visit from Buggy Jem, whose appearance at once impressed me by its unwonted gravity.

Indeed, he was more than grave. There was a perplexed, startled, one might almost say an awed expression in his sharp little pig's-eyes, which, dilating them unnaturally, gave to his whole face an aspect irresistibly grotesque.

"What's the matter, Jem?" I inquired.

Buggy Jem shut the door with mysterious care. He looked all around him, as if to make sure that no other person was present, and then, lowering his voice to a deep, solemn bass, remarked:

"Kurnul, ef ever a man seed the devil, I've seed the blasted cuss this day!"

"How? where?" I responded.

"Well, kurnul, I was a-passin' by that derved house of Blinky's on my way to Sixteen, when the biggest sort of jabberin' and howlin' just made me stop a spell and look in at the window. Wish I may die ef I didn't see thar at the old bed-head little Scrub a dancin', and yellin', and gallivantin', round a black figur sot up stiff and straight agin' the bolster, with a face yellow-white, like putty, and O Lawd! sich eyes, sich eyes!" And Buggy Jem lifted up his own eyes in amazement and horror.

I knew the fellow's inordinate propensity for exaggeration and even downright lying, but evidently he had, for once, witnessed a horrible spectacle of some sort; therefore, about sunset, I mounted my horse and rode over to Blinky's with a disagreeable presentiment of evil. Both the hour and the season appeared ominous and dreary. Low, wailing, funereal winds moaned among the tops of the swaying pines; huge masses of dark-gray clouds scudded threateningly overhead, while the dead autumnal leaves fell thick and fast along the solitary road.

Having reached the rude "clearing" before the cabin, I dis-

mounted and hitched my horse securely to the bough of a sapling. Then a curious sensation, not certainly of fear, but rather a mixed feeling of suspense and repulsion, took possession of me. I stopped, hesitating and anxious, when the silence was broken by an awful cry, not loud or shrill, but deep, guttural, husky, as from the throat of a person on the point of strangulation, followed by a long, inarticulate quaver, a hundred times wilder than the shrieks of an Irish wake or the hoarse-falling dirge of the bag-pipe.

"That is Scrub's voice," I muttered. "Can the old brute be torturing or killing her?"

Without a second's further delay I went up to the door of the hut and opened it. A stormy light from the west flooded the room, in the full glare of which rested the form of a man starkly outstretched upon the tattered bed.

Dressed in a suit of the finest black broadcloth, I might have supposed that some stranger had temporarily sought the hospitality of the cabin, but the rigid lines of the figure, and the sight of Scrub hovering about its head, moaning or crying her inarticulate cry with unearthly persistence, forbade such an idea as soon almost as it had arisen.

Going nearer, I could see the face distinctly but for a few minutes. Although I recognized it as Blinkey's, death had so transfigured the countenance that I stood gazing upon it with speechless astonishment and awe.

What! Could *these* be the features of the miserable outcast whose every word had been a curse, and whose breath was pollution? As the lurid sunset flickered over them, they seemed, despite their deadly pallor, to be alive—alive with the *dignity of a recaptured soul*, which, asserting itself even in the hour of dissolution, so elevated the ruined face as to impart to it an utterly-indescribable aspect of spirituality! It was not a contented or serene, far less a blissful expression. Rather it resembled the look of one who, in the sudden illumination poured upon him from the Eternal Throne, had at the same instant recognized the enormity of his own sins and the possibility of some future supreme purification. I could not help believing that, in the dreadful, glimmering vagueness of the "valley of the shadow of death," there had come to this man so much of mercy that the devils long possessing him had been cast out, and some ineffable hint of a redemption in the far eternities had been whispered to his heart! How, otherwise, could it be possible to explain the blended humility and majesty, the very abasement of humility, the supremest exaltation of majestic patience (strengthened for an expiation of ages), which then and there separated the countenance of that dead malefactor from all other faces I had ever beheld, quick or dead?

Meantime, with an impish motion, Scrub flitted to and fro near the bed, now peering keenly into the unclosed eyes of the corpse, and then throwing her lean arm upward with a gesture of pathetic abandonment as she uttered her strange shriek.

Once or twice she placed her hands firmly upon the shoulders of her dead protector, shaking him with a sort of fury; and, when nothing came of this—when no sign of life was manifest—the forlorn, distraught little creature seemed for a while paralyzed, and could only moan after the fashion of some animal in pain that was unendurable.

Regarding the careful manner in which Blinkey's body was attired, and the fine quality of the suit he had chosen for his grave-clothes, I conjectured that, feeling the approaches of death, he had determined to assert in *articulo mortis* the reputable position from which he had fallen, or perhaps, as the soul his vices had banished shuddered back toward its desecrated body, just previous to the everlasting separation of both, he desired—obeying an occult instinct—to array himself with cleanliness and decency.

The broadcloth suit itself had probably been preserved by accident among the few articles of personal property brought by its owner years before to the log-cabin in the woods.

As Blinkey had evidently been dead for two days and more, I saw the necessity of his being buried as soon as practicable. Accordingly I took the promptest measures to have the corpse legally identified, and, at a late hour of the night, I stood by the side of his open grave, which a couple of stalwart laborers had been hired to dig, prepared, in the absence of a clergyman, to read the funeral-service myself. This—choosing the magnificent ritual of the Episcopal Church—I proceeded to do, amid the surprised silence of my two workmen, and what seemed the apathetic despair of Scrub, who had followed

the body quietly to the place of sepulture, and was now with folded arms looking down upon it, not a muscle of her poor, wizened, ancient little face stirred by any perceptible emotion. The place chosen for the grave lay between a pair of gigantic pine-trees not far from the cabin-door, and on the summit of a steep desolate hill. Only the solemn starlight shone upon the scene. Shadows of bush, tree, and passing cloud, wavered across the sward, and now and then the voice of a distant night-bird sounded strangely from the tangled depths of swamp or thicket.

The service at length concluded, we prepared to lower the body into the grave; but, scarcely had we taken hold of the linen sheet which I had caused to be wrapped about its darker garments, when Scrub hurled herself upon it, and, with a grasp of absolute frenzy, endeavored to frustrate our purpose. I tried gently to draw her back, but the effort was fruitless. Persuasion, by means of every variety of pantomime, proved also vain; therefore, no choice was left us but to force the poor creature away as considerably and tenderly as we could. The grief of the dumb girl was so violent that finally she became insensible; whereupon we completed our task, and then, under the subdued light, and with a million weird-like whisperings of the forest-leaves in our ears, we left the dead to his long repose.

As for Scrub, borrowing a cart and donkey from one of my assistants, who meanwhile rode my horse, I placed the still unconscious child upon some fragments of hay that strewed the bottom, and slowly drove homeward.

The morning-star was shining brightly in the heavens, when I came to the enclosure about our cottage; and, paying the countryman for his cart, knocked loudly at the front door. My wife, looking, as I told her, provokingly pretty in her variegated *robe de chambre*, at once admitted me, surprised, of course, to find that I was accompanied by *such* an associate. But my story, briefly and earnestly told, reconciled her immediately to the presence of our guest. She rushed off for restoratives of a dozen different sorts, and in a short time we were pleased to see their effect in the partial restoration of the girl to consciousness.

Administering some weak brandy-and-water, we then put her to bed in a vacant room next the library, and left her, as we trusted, to repose.

"Oh," said my wife, with the tears in her eyes, "what a scene you have gone through with to-night! And that wretched child, *what* are we to do with her?"

"Well, my love, we must keep her for a few days at least; our neighbors are ignorant and superstitious, and would let her starve in the woods, rather than have the imp, as they think her, with any one of them."

It seemed, however, do as we might, that Scrub was destined to starvation. For the next sixty hours, not a morsel passed her lips. No persuasion could induce her to eat, though we tempted her with delicate fare.

Tossing and moaning, moaning and tossing on her cot, she grew so wan and haggard, that her usual resemblance to some old, old woman, became so intensified as to appear in the last degree abnormal and grotesque. But about midnight on the third day of this dangerous abstinence, I was awakened by a tremendous clatter, a dash of miscellaneous articles falling in the pantry beneath my chamber. Passing down-stairs with a candle, and appearing on the scene of tumult, there was Scrub coolly seated, like a goblin Marius, amid the ruins of plates, dishes, tumblers, wine-glasses, and saucers, with the breast of a roasted turkey in her lap, and a drumstick of the same luscious bird in the act of being ravenously devoured between her teeth. She had found her way, somehow, to the safe, which being locked, and resisting her efforts to open it, no doubt the half-famished little animal had dragged the cupboard down, burst the fastenings of the door, and thus secured for herself a meal, in the midst of the *débris* of quite a Carthage of crockery.

It happened to be moonlight; therefore she could see to conduct her depredations efficiently.

For a fortnight longer Scrub remained at our house, evidently a restless, unwilling guest. Repeatedly she tried to run away, but we kept a sharp eye upon her, and the tameless young Ishmaelite was always caught, and brought back kicking and struggling, or sullen as an outraged savage.

Once she managed to secure a bottle of our best Madeira, and imbibed the whole of it; consequently, she was made excessively drunk,

to the disgust of my wife, and the amusement of the servants, who encouraged her extravagant antics.

But Scrub's last feat procured her prompt and final banishment from among us.

One morning just after breakfast, a shrill treble was piped from the parlor, where Master Theo, aged eight, our only son and heir, had been sent to learn his reading-lesson. The tableau beheld, as we hastened to the rescue, was more lively than satisfactory. Theo lay sprawling on his back, two mottled legs convulsively *pawing* the air, while, bestriding the urchin's stomach, Scrub, entirely at her ease, was engaged in tattooing the victim's face with her hawk-like finger-nails.

This was too much. Master Theo's mother pounced upon the culprit, and for the first, and I am sure the last time in her life, her fair hands were employed in necessary chastisement.

The day after, Scrub was on her way to the city of F—, to be placed in the celebrated "Deaf and Dumb Asylum," there. A certain surplus sum, which my last work of fiction had unexpectedly brought me, I devoted to Scrub's benefit, and to the securing of extra medical attention to her case.

A month—two months—passed. All accounts received from the asylum of our poor unfortunate were the reverse of encouraging. She was, by turns, sullen and furious, perversely cunning, and openly outrageous. Nothing whatever could be taught her. "Indeed" (the principal of the institution wrote me), "I have never, in all my manifold experience, met with a human creature, to all appearance, so thoroughly *animal*. We are not merely discouraged, but disgusted and repelled."

Finally, during a spell of the severest weather known at the South for thirty years, in the latter portion, I think, of the month of January, news reached me that Scrub had evaded the watchful care of her guardian, and was nowhere to be found. The most rigid search, the widest advertisements, were without avail. As time crept on, it was generally concluded that the ill-fated little Bohemian had come to her death somewhere in the swamps or forests.

I myself began to entertain this opinion, when, in the following March, chance carried me, for the third time in the course of this narrative, to the vicinity of Blinky's cabin, which the superstitious fears of the "sand-lapping" gentry had left untouched. The weather continued unwontedly bleak and cold, the wind being sharp as a razor, and howling sometimes like a famished wolf. As the top of the old familiar hut came in view between the gaunt trunks of the pines, I suddenly drew rein to listen. What sound was that, feebly and flittingly borne upon the gale, and dying off with abrupt, spasmodic harshness? The sound of a *violin*, surely, but a violin played by some ignorant, inexperienced hand.

Instantaneously the thought flashed on me that I should find Scrub in her old home; that her hand, and no other's, held that uncertain bow. Indeed, I was not mistaken; for, upon once more peering through the cabin window, I saw the girl half-sitting, half-lying, along the filthy, disordered bed, nodding her head weakly up and down, with the violin at her shoulder, and imitating—though of course she could hear no sound—the motion with the bow-hand she remembered in Blinky's playing. Again, an angry sunset flooded the room, brought out into strong relief the squalid rafters festooned with cobwebs, the dusty, uneven floor, the few pieces of dilapidated furniture, and, above all, the elfin features of Scrub, many times more weird, uncanny, and elfin-like, than ever.

They were pinched and wasted grievously; a red, feverish spot burned in either cheek, and her eyes, once so small and keen, now looked unnaturally large and languid in their hollow sockets.

As I turned from the window to the door, she detected my presence—leaped from the bed, and strove to make her escape. But the poor wild thing had lost her former activity and strength. She fell just outside the threshold, panting like a wounded partridge, and lifting the dumb agony of her eyes to my face in a manner I could hardly endure. Lost, forlorn, bewildered little savage, coming, God only knew whence, tossed from billow to billow of a life which stunned and wearied her, there was *that* in her expression which plainly told me her release was near.

I could not doubt that the born nomad had wandered for weeks among the wildest, least-frequented localities (after quitting the asylum), stealing her food when she could, and going without it rather than risk the chances of recapture.

Nor could I doubt that some marvellous instinct, akin to the in-

stinct of birds or beasts, had led her through the hundred and odd miles that intervened between the city of F— and her former home in the pine-barrens. And the magnet that drew her on was a lonely, unhonored grave. Meanwhile, as I have said, Scrub lay panting and exhausted. Semi-starvation and exposure had done their work upon her. She had not the energy to resist when I took her in my arms, and laid her gently on the comfortless bed within.

"The child," thought I, "is not long for this world, but still a doctor might help her somewhat." So for a doctor I went. Our county Æsculapius had fortunately returned from his "rounds," and I at once secured his services. He examined Scrub's condition, and, as he did so, remarked: "There's no hope whatever—last stage, you see, of what we call galloping consumption. No use even to remove her; 'twould merely fidget the creature, and make her worse."

Convinced that he was right, I confined my philanthropic efforts to the more cleanly and comfortable arrangement of the bed, from which I felt assured that Scrub would never pass alive. All that night, having made a huge fire of hickory and pine knots on the hearth of the cabin, I watched the child's uneasy slumber. Every now and then, she would start from sleep, sitting perfectly erect, and looking around her with an eager, wistful gaze. The moonlight-shadows came and went across the floor, or crept up the walls, like impalpable tides of a soundless, mysterious sea. The wind, no longer blowing in mad, irregular gusts, moaned through chink and crevice, suggestive of the voice of some misguided spirit calling plaintively upon its fellows. And the rush of a neighboring stream blended with the voice of the wind, over which, occasionally, one could hear the deep, melancholy boom of a falling pine, cut through by the ruthless fangs of fire that had recently devastated the forest. Certainly a "growsome" scene—an hour weird and awful! Still, as the time slowly passed, I continued to brood over the flames that danced and wavered in numberless grotesque shapes, now taking the form of a huge volcanic eruption, and anon forming themselves into beautiful rivers flowing through lands of enchantment—a tropic sunlight irradiating the waves, or flashing upward in jets of purple and gold and amethyst. And so, gradually and unconsciously, I sank from reverie into slumber.

Hours after, the decay of the fire, and the cold wind that preceded morning, awoke me.

I looked round mechanically, rubbing my eyes with stupid surprise, when they rested on the patient's bed and found it empty. The cold moonlight shimmered across the coverlet, and the moaning of the wind now seemed articulate.

I staggered drowsily up, and remarked that the door—previously well secured—was wide open. Looking onward, I could recognize the site of Blinky's grave. A dark object, indistinctly outlined, rested upon the surface of the mound. What was it? Still in a half-dream, I approached the spot; and there, her wasted cheek lovingly pressed against the earth, her arms outstretched as to embrace the dead form beneath, lay the outcast child, as dead and cold as the corpse of him she sought. Outcast—yes; but outcast perhaps no longer! Who shall say that the loyal little heart, so stanch and faithful, through the mists of physical affliction and the perplexities of cruel want, to its one earthly friend, had not gone to the bosom of another and a celestial Friend, even the pitiful Christ, who said, "Suffer little children to come unto me, and forbid them not, for of such is the kingdom of heaven?"

PAUL H. HAYNE.

PARIS AFTER THE PEACE.

THERE are, probably, few points of view in Paris better known to the travelling public than the avenue which leads from the Arc de Triomphe to the main entrance to the Bois. It now bears the name of General Urich, the defender of Strasbourg; but to the world at large it is still known, and will be known for many a year, as the Avenue de l'Impératrice. As I write the name, the avenue rises before me as I have witnessed it on many a sunny afternoon. The great broad slopes of turf which line either side of the wide thoroughfare are gay with rich beds of flowers. It is the *retour des courses*, and all Paris has crowded out to see the race-course company drive back into the capital. The trim gravel walks are thronged with family parties of kindly *bourgeois* folk, accompanied by children and nurses innumerable; the riding-path is dotted over with cavalcades of horses; the

great central road is filled with treble lines of carriages, moving slowly to and fro—carriages of all kinds, from the lordly barouche to the humble *fiacre*; from the four-in-hand of the Jockey Club to the Victoria, in which *ces dames* display the marvels of their toilet. Every thing is bright, gorgeous, gay, to look upon. The huge imperial gendarmes, mounted on their iron-gray horses, patrol up and down, keeping the carriages in line. Then, when the avenue was at its fullest, and it seemed impossible to force a way through, the stream of carriages would part asunder, a cavalcade of wild-looking spahis, digging their horses' flanks with their cruel stirrups as they galloped on, would pass through the opening, and in an open barouche, escorted by outriders in green-and-gold liveries, Napoleon III., the "wise prince," as the world, after Mr. Disraeli, then called him, the Badinguet of to-day, would drive past, bowing listlessly to languid salutations. Such is the framework of the constantly-recurring pageant, familiar to me, as to all sojourners within the French capital, associated with the name of the Avenue de l'Impératrice. It has been my fortune to see most of the famous parks, drives, corsos, of which the Old and the New World can boast; and, according to my judgment, there is no promenade I have ever witnessed, which, in brilliancy and outward show, bears any comparison to the avenue to the Bois in the days of the second empire.

Let me recall it now as I saw it but the other day. The grass-covered slopes were covered over with *tentes d'abri*, by whose sides groups of soldiers sat around camp-fires, lounging sullenly. The flower-plots had been trampled under foot, the trees cut down for the most part. The villa-palaces which lined the avenue were closed and deserted. Not a puff of smoke could be seen rising from the chimney-tops. It was just the hour when Paris was wont to drive out to the Bois; but not a carriage was to be discovered from the Arc de Triomphe right down to the walls. An omnibus stood waiting by the gates; a solitary horseman galloped along the riding-path. The gorgeous gendarmes were replaced by two sentries in civilian dress, with broad red stripes down their velvet trousers, who strutted about with their hands in their pockets, their muskets leaning against a wall hard by. The grass-grown walls, which, in spite of the cannon mounted in the embrasures, looked in the old days so quiet and so peaceful, had changed their aspect. Your first thought, had you not known the truth, would have been that some great drainage-works were going on along the sleepy Boulevard de Lannes, which runs inside the ramparts, and had been suspended by a strike of the workmen. As you looked down, you saw that the banks were scored and furrowed with trenches, galleries, bomb-proof passages, and rifle-pits. Whether shells had actually fallen on this portion of the walls, or whether the destruction had been wrought during the removal of the guns, I could not learn. But the whole line of fortifications hereabouts had the look of works which had suffered from heavy fire. There was everywhere that air of wilful, wanton destruction which you see in places that have been knocked about by a bombardment. The solitude was oppressive; the silence of the scene painful. A company of raw recruits were being taught the goose-step in a small square leading out of the Boulevard Lannes. Hard by was a house belonging to an old friend of mine. I rang at the bell, but found the place deserted. The last time I had driven along the road, not a year ago, I remember having seen a group of children playing on the slopes of the walls by the mounted cannon, and thinking how peaceful the whole place looked. I climbed up the walls, and looked down upon what was once the Bois. For a space some half a mile in breadth from the walls there stretched a long, bleak expanse, reminding one of the clearings I have seen in the backwoods of the Western States. The avenues, bosquets, winding paths, banks, and arbors of the Bois had disappeared, and in their place was a plain covered with the stumps of trees, cut some foot or so above the soil. In the distance rose the dark belt of trees which still stands around the lake; and there, no doubt, before many months are over, the fashionable world of Paris will congregate once more; but the bared clearing between the walls and the entrance to the Jardin d'Acclimation will remain for many years as a reminiscence of the siege. For the moment its desolation was complete; a party or two of wood-cutters collecting the fallen branches from amid the stumps, an ambulance-cart with the red cross on its side, were all the moving things that supplied the place of the goodly company which was used to take its pleasure here day after day. The sky was dull, laden with snow-clouds, faint gleams of wintry sunlight flickered from time to time

over the dreary scene; the bare spaces where the guns used to stand added to the look of desertion which surrounded every thing; the ceaseless rat-tat of the drum, keeping time for the recruits' steps, sounded mournfully; half a dozen idlers like myself stood on the walls looking sadly at the solitude before them. Mont Valérien towered on the horizon above the Bois. All was cheerless, forlorn, desolate.

I have dwelt upon this scene because, in as far as I saw of Paris, it is the one sole position in the whole of the city in which the real presence of the war is forced upon you unmistakably. Outside the walls there is ruin and desolation enough to show that a great warfare has just been carried on. But, if you except the view from the walls adjoining the sometime Avenue de l'Impératrice, you might wander about the city for hours without coming on any thing which would show you that war had passed by there. I have no wish to accuse the correspondents who described the siege of Paris in our English papers of wilful exaggeration; but I think, after the wont of chroniclers sadly in want of matter, they generalized from individual incidents, and confounded what they heard was likely to take place with what they knew to have actually taken place. We heard a great deal about the devastation worked by the bombardment. If you want to know what shelling a town really means in earnest, you can acquire the knowledge easily enough at St-Denis or St-Cloud. You will not learn the lesson in Paris. You must walk for a long time and use your eyes sharply about the quarter—that of the Panthéon—where the shells fell thickest, before you see a trace of the bombardment. As far as I could see, there has not been a single street or public building in this quarter which has been materially damaged by the Prussian cannon. Whether dropping a few hundred shells into a crowded city is or is not a more wanton piece of destruction than a serious bombardment, is a point on which I do not care to enter; but of this I am sure, that, whatever the moral effect of the bombardment of Paris may have been, the material effect was absolutely insignificant. So, in like manner, there has been a strange amount of sensational reporting about the external injuries inflicted on Paris by its citizens. The trees which line the Boulevards are untouched; the Champs Elysées are just what they used to be; the Tuileries remain unshorn of their foliage.

Judging from what I see of things, I cannot but fancy that there may likewise have been a great deal of exaggeration about the actual horrors of the siege. Of course, it is impossible to prove a negative; and I cannot pretend to say that the spectacle of famished women gnawing bones like wild beasts, and such like incidents of siege-life in Paris, as portrayed by imaginative chroniclers of the Besieged-Resident order, may not have been witnessed in the streets of the capital. But I am convinced that such incidents were no more characteristic of the daily life of Paris during the siege than deaths by starvation at Bethnal Green are of the daily life of London. Putting together various accounts I heard from many people who lived through that time of trial, I have come to the following conclusions: The great mass of the working-class were by no means badly off. The men had for the most part their thirty sous a day as National Guards; the women and children had their rations; and, though there was much sickness, distress, and suffering, among the operatives, it was scarcely, if at all, greater than in any ordinary hard winter when work is slack. The well-to-do classes, who had money at their disposal, had laid up large stores before the investment began; and, though they also were exposed to great discomfort through the curtailment of their accustomed luxuries, they were as a body never brought face to face with actual want. The real pinch and stress fell almost exclusively on the class of small employés, clerks, shopmen, skilled artisans—in fact, on the whole class which lives by weekly wages paid for brain-labor. The sufferings of this "Mezzo Ceto" portion of the community were terrible; they had no wages or earnings to receive, they had no savings to invest in food; they were too independent to beg for alms, too feeble to hustle and struggle for rations with the crowd. It was among this class, which starved and pined away, died and made no sign, that the mortality was the heaviest; and I have no doubt that, if the true story of the siege could be written, it would reveal piteous cases of cruel misery, sad enough in all conscience, but confined, with few exceptions, to the intermediate class between the workman and the employer. If this theory of mine is correct, it serves to explain a good deal that is otherwise inexplicable in the history of the siege.

How was it, I am often asked, that the population of Paris, so

turbulent, hot-headed, and impatient of control, as its history in the past, and, alas! also in the present, shows it to be, exercised such wonderful self-restraint and moderation throughout their long isolation from the outer world. My answer is, that the governing class and the working-class alike never had their resolution tested by the dire extremity of hunger; and that the class which really bore the burden of the siege is the class which never makes barricades or *coups d'état*, but, under every administration, obeys the powers that be. Let me not be misunderstood as denying to the Parisians the claim of heroism. The resistance of the city would have been impossible, if, amid all classes, there had not been an almost superstitious devotion to the cause of Paris, a readiness to sacrifice personal considerations to the common good—a conviction that the honor of France was intrusted to their hands, and that Europe was watching to see how the trust would be discharged. That this national sentiment has its strong as well as its weak side, I should be the last to deny. I wish I could feel confident that, under like conditions, London would exhibit a like patience and resolution. But I am only stating facts when I declare that the heroism of Paris, be it great or small, was not subjected to the fiery trial of starvation.

And, if I am right in so thinking, I fancy that any patriotic Frenchman, no matter to which particular line of politics he belonged, would feel after revisiting Paris that his country had entered on a better era. The empire has fallen, and Paris has recovered much of the look she wore in earlier and simpler days. How long the reformation may last I do not pretend to guess. But, for the time, the reign of the Coedès and Cocottes is at an end. The Victorias have vanished, and the ladies with the indecorous, gorgeous toilets, which the small journals used to love to chronicle, have disappeared with them. I dare say there is vice and to spare still in Paris, but I am Philistine enough to think that vice, restricted, regulated, and kept in seclusion, is far less injurious to public morals than vice flaunting unrestrained about the streets. The *cafés* along the Boulevards are no longer crowded with public women, and the few you see about are quiet, not to say dowdy, in their costumes. While I was in Paris, a few returned *viveurs* gave a supper-party at the Maison Dorée, where the general portion of the guests belonged to the class which used to make the fortune of the *cabinets particuliers*; and late in the evening, the revel became so uproarious that the sound of the women's voices could be heard on the Boulevards. Forthwith a crowd assembled outside, and informed the landlord that the party must break up at once, or else the establishment would be attacked. At such a crisis as the present revival of the scandals of the empire was an insult to public feeling. And, with all respect for the exercise of individual liberty, it seems to me this manifestation of popular sentiment was not an unhealthy sign.

In like manner, though Paris had now been at peace for weeks, there was no symptom of the revival of the passionate pursuit of pleasure which distinguished the era of the empire. For the first time for a series of years there were no public balls on the night of the *Mi-Carême*. An edict was issued on the evening previous forbidding any masquerades on the night in question; but the edict was much criticised by the press, on the ground that nobody had proposed giving any entertainment of the kind. The only ball advertised was one at Salle Valentino; and that was scantily frequented. And, as far as I could learn, there was not a single casino or *salle de danse* permanently open in the whole of Paris. There were not half a dozen theatres open in the city; not a single new piece was even advertised. Of course this lack of public amusement was due in no small measure to the fact that almost all the public *entrepreneurs* are ruined, and that the theatre and casino-frequenting public is very short of money. I have no idea that the Parisians are likely to become Puritanical, or to be made forthwith moral and virtuous. Before many months are over, the tide of pleasure will doubtless be again in full flow; but I question it ever reaching the height it did under the reign of imperialism. It is no great credit to the Parisians that they should have no heart for merry-making, while the Prussians are within a couple of miles of Paris, and their guns still command portions of the city. It would, however, be an infinite discredit to the Parisians were it otherwise; and when I am told, as I often am, that they are indifferent to the calamities of France, I think it only fair to say that their outward demeanor was that of a population still stunned by a terrible misfortune.

But of all the changes in the aspect of Paris which most strike a visitor who has not seen the city since the days of the empire, the greatest is one which it is easier to appreciate on the spot than to describe at a distance. I know not how better to express it than by saying that the life has somehow gone out of Paris. It is not only that the streets are half empty, that carriages have wellnigh disappeared, that the shop-windows are bare of wares, that trade is obviously at a stand-still, that house after house is shut up, that there is no building going on, that beggars are to be met with everywhere; there is besides all this an unavoidable impression forced upon you as you wander about the city, that Paris has outlived its prime. Much of this impression may be owing to the circumstances of the moment, but still even when order is restored under a settled government, I question if the recovery of Paris will be a very rapid, or even a very thorough one. Beneath the empire Paris was developed by artificial means. The wondrous aggrandisement and embellishment of the city were out of all proportion to the natural growth of the country, marvellous as that growth was. And the artificial stimulus afforded by the imperial system being removed, the grandeur of Paris has, I think, collapsed for many a year to come. Except in the improbable event of a Napoleonic restoration, any government likely to be established in France must rely more upon the provinces than upon the capital. The desire exhibited by the great majority of the Bordeaux Assembly, elected as it is by universal suffrage, to remove the seat of government from the banks of the Seine, was not merely an ebullition of provincial jealousy or reactionary partisanship, but was the expression of a wide-spread, popular conviction that the virtual supremacy of Paris is fatal to the welfare of France. While France remains a nation, Paris must, in my judgment, remain its permanent capital. But the government of the future will have no motive to maintain, still less to augment, the importance of Paris; and therefore I see no prospect that in our days Paris will ever recover her pristine grandeur. That her loss may prove the gain of France, must be the wish of all who, like myself, believe that the existence of France as a prosperous and powerful community is essential to the welfare of Europe.

EDWARD DICKY.

YOSEMITE.

WE give, in this week's JOURNAL, two illustrations of the famous scenery of the Yosemite Valley, in California, drawn by Mr. Fenn from photographs by Anthony. This wonderful chasm is situated on the Merced River, in the southern portion of the county of Mariposa, and one hundred and forty miles a little southeast from San Francisco. It is on the western slope of the Sierra Nevada, midway between its eastern and western base, and in the centre of the State, measuring north and south. It is a narrow gorge, eight miles in length, from a half to a mile in width, and enclosed in frowning granite walls rising with almost unbroken and perpendicular faces to the dizzy height of from three to six thousand feet above the green and quiet vale beneath. From the brows of the precipices in several places spring streams of water, which in seasons of rains and melting snows form cataracts of beauty and magnificence surpassing any thing known in mountain-scenery.

This valley was discovered in the spring of 1851 by a party under command of Major James D. Savage, in pursuit of a band of predatory Indians, who made it their stronghold, considering it inaccessible to the whites. Its name, "Yosemite," pronounced as if terminating in y, was given to it in the belief that it was the Indian term for grizzly-bear. Several Indian names have been given to prominent rocks and falls in the valley, but, as these are difficult of pronunciation, and as it is doubtful if these savages ever had names for such objects, these have been discarded, and the more appropriate and definitive names of our own language adopted, with a few exceptions.

A few years since this section was granted by the United States Government to the State of California, and it will be forever preserved for public use. It is becoming a great resort for tourists, and, as it becomes better known, and the means of access are improved, the interest in it will be greatly increased. The most interesting time for a visit is in May or June, when the streams are full and the falls produce their grandest effects.

It is difficult to find comparisons to give an impression of the

PICTURESQUE AMERICA.—YOSEMITE VALLEY, FROM MARIPOSA TRAIL.

PICTURESQUE AMERICA.—THE YOSEMITE FALLS.

grandeur of the scenery or of the lofty precipices surrounding the valley. If the reader crosses the continent on the Pacific Railroad, let him imagine, when on the loftiest mountain-pass, that it be cleft in twain to the level of the sea, and from the base he can look up four thousand feet to the summit of El Capitan, or six thousand feet to the glistening crown of the South Dome. If from New England, let him reflect that its loftiest peak—Mount Washington—raises its head only to the height of one of these giant rocks. But this grandest scenery of the world cannot be described.

The great gorge is not the only object that calls the visitor to this section. The vegetable productions are in keeping with the majestic rocks and giddy water-falls. Surrounding it, at distances of from ten to fifty miles, are numerous groves of the great trees which have so astonished the world. These have been principally examined by Whitney and his corps of geologists, and their number is unknown. Those of Calaveras are more accessible and better known, but, large as they are, many are found in the Southern groves exceeding them in size. Whitney measured one of one hundred and six feet in circumference and two hundred and seventy-six feet high. Another, lying prostrate, has been burned so hollow that one can ride on horseback in the cavity for a distance of seventy-six feet and have ample room to turn around. The big trees of this section are not in a single grove, as in Calaveras County, but are scattered through an extensive region at an elevation of from six to seven thousand feet above the sea. One collection, known as Mariposa Grove, lies within about five miles of the road leading from Mariposa to Yosemite, and from this fact has become a great resort for visitors. There are in the grove about six hundred large trees of from thirty to one hundred feet in circumference and from two hundred and thirty to three hundred and twenty-five feet in height. These are of the *taxodium* family, and bear the general name of *Sequoia*, in honor of the Cherokee chief who made an alphabet for his tribe, but are distinguished by the specific name of *gigantia*. This grove is the property of the State of California, and will be preserved as a public resort. The grove is reached from Mariposa or Yosemite by leaving the trail at Clark's, a station about midway between the two places, and taking an easy road to them about five miles distant. Other groves are in the vicinity, and the Indians report still others, with larger trees, farther in the mountains, which white men have never seen.

The tour of the Yosemite and Big Trees is one of unparalleled interest, requiring some preparation and endurance to make it, but is made without danger and at a slight expense. The railroad and stages convey one over a great part of the distance, and saddle-horses and experienced guides conduct one the rest. A good hotel is found in the valley, and comfort and health, as well as novelty, reward the traveller.

THE DESCENT OF MAN.

FROM "BLACKWOOD," FOR APRIL, 1871.

(*Darwin loquitur.*)

"MAN comes from a mammal that lived up a tree,
And a great coat of hair on his outside had he,
Very much like the Dreadnaughts we frequently see—
Which nobody can deny.

"He had points to his ears, and a tail to his rump,
To assist him with ease through the branches to jump—
In some cases quite long, and in some a mere stump—
Which nobody can deny.

"This mammal, abstaining from mischievous pranks,
Was thought worthy, in time, to be raised from the ranks,
And, with some small ado, came to stand on two shanks—
Which nobody can deny.

"Thus planted, his course he so prudently steered,
That his hand soon improved and his intellect cleared;
Then his forehead enlarged, and his tail disappeared—
Which nobody can deny.

"Tisn't easy to settle *when* man became man;
When the monkey-type stopped and the human began;
But some very queer things were involved in the plan—
Which nobody can deny.

"Women plainly had beards and big whiskers at first;
While the man supplied milk when the baby was nursed;
And some other strong facts I could tell—if I durst—
Which nobody can deny.

"Our arboreal sire had a pedigree too;
The Marsupial system comes here into view;
So we'll trace him, I think, to a great kangaroo—
Which nobody can deny.

"The kangaroo's parent, perhaps, was a bird;
But an ornithorhynchus would not be absurd:
Then to frogs and strange fishes we back are referred—
Which nobody can deny."

Thus far Darwin has said; but the root of the tree,
Its nature, its name, and what caused it to be,
Seem a secret to him, just as much as to me—
Which nobody can deny.

Did it always exist as a great institution?
And *what* made it start on its first evolution?
As to this our good friend offers no contribution—
Which nobody can deny.

Yet I think, that, if Darwin would make a clean breast,
Some botanical views would be frankly confessed,
And that all flesh is grass would stand boldly expressed—
Which nobody can deny.

The loves of the plants, so deliciously sung,
Must have softened his heart, when his bosom was young,
And the "Temple of Nature" has prompted his tongue—
Which nobody can deny.

But, now, if in future *good breeding* we prize,
To be cherubs and angels, we some day may rise;
And, indeed, some sweet angels are now in my eyes—
Which nobody can deny.

If this is our wish, we must act with due care;
And in choosing our spouses no pains we should spare,
But select only those that are wise, good, and fair—
Which nobody can deny.

Yet however he came by it, man has a soul,
That will not so submit to despotic control,
As to make monks and nuns of three-fourths of the whole—
Which nobody can deny.

The bad may be pretty, the good may be plain;
And sad matches are made from the lucre of gain;
So, perhaps, as we are we shall likely remain—
Which nobody can deny.

After all, then, I ask, what's the object in view?
And what practical good from this creed can ensue?
I can't find in it much that's both useful and new—
Which nobody can deny.

Our old friend Lucretius * explained long ago
How the fittest survive and the weak are laid low;
And our friends of the farm must a thing or two know—
Which nobody can deny.

* Lucretius, v. 887-877.

I would ne'er take offence at what's honestly meant,
Or that truth should be told of our lowly descent;
To be sprung from the dust I am humbly content—
Which nobody can deny.

But this groping and guessing may all be mistaken,
And in sensitive minds may much trouble awaken,
So I'll shut up my book, and go back to my *Bacon* *—
Which nobody can deny.

THE DERBY DAY.

IF there is one pastime or amusement peculiarly conducive to the tastes of John Bull, it is horse-racing; or a day in which he thoroughly enjoys himself, it is, *par excellence*, the "Derby Day." Then is the time to see him in all his glory. He throws business to the winds, shakes off his cloak of *ennui*, and gives himself up solely and entirely to pleasure.

This is about the only day in the year, of course excepting the usual forlorn Sunday, in which you can perceive a palpable difference in the streets of London. West End and East End, it is easy to be seen that something unusual is taking place. Cast your eye down Fleet Street, Cheapside, Ludgate, Ratcliff Highway, Holborn, or the New Cut, it will be easy to tell that there is not the usual amount of traffic. Again, you can with ease and comfort stroll along Regent Street, old Bond Street, or Piccadilly, without risk of a catastrophe; through St. James's Park, or Rotten Row, without being crushed to death by the carriage of some dowager-duchess, or trampled to death by the fiery steed of a pretty horse-breaker. Yes, London is completely turned inside out. Then, where is everybody gone? We have not to wonder long, for, from all quarters of the vast metropolis, throngs upon throngs of pleasure-seekers are wending their way to Epsom, or, in other words, "going to the Darby." If you were to question many of them as to what they were going to see, they could not tell you, except that some kind of racing would take place, but "when, where, or how," they had not the most remote idea.

Yes, without doubt, Derby Day is the great event of the London year, and it is looked forward to with eagerness and expectancy by all parties, from the royal prince, in his splendid equipage, and surrounded by outriders and an escort of dragoons, down to Joe the costermonger, in his donkey-cart—all look forward to the day with a profound relish.

There is, however, unfortunately a dark side to this picture. As a rule, betting runs higher, and more money is placed on the "favorite" for this race, than any other during the season. Many of the flower of the English nobility have been utterly ruined by this foolish system of "plunging." Take, for example, the late Marquis of Hastings, who lost fabulous sums in 1867, when the favorite was nowhere, and a rank outsider, Hermit, the property of Mr. Henry Chaplin, won the race at sixty-six to one. And there is many another marquis, duke, and baronet, who has squandered his fortune and estates on the turf, and, in all human probability, there will be until the end of time. The English nation are proverbial for their love of betting, but, win or lose, they take it all in good part.

Let us accept the invitation of Lord Tearaway and Sir Harry Whipecord, and make one in their splendid turn-out. Our road lies through Kennington, Clapham, Ewell, Cheam, and Morden. What excitement and confusion as we drive along! The road is lined with vehicles of every description, and all are trying to get ahead of each other. But good temper and merriment prevail. Every one seems bent on enjoying himself to the utmost.

After a hot and dusty ride, the Downs are in sight, and, wending our way to the paddock, we pay the usual "half a sov.," and are admitted. There is still the old tree in the centre, which has witnessed

* Certainly the Darwinian theory, though it may be interesting as a theory, is a considerable encroachment on Baconian principles, which require that no theory should be adopted without an adequate induction from facts much more direct and complete than any that the Darwinians have yet discovered—if, indeed, they have discovered any fact at all that infers the possibility of the transformations which they promulgate.

The "Botanic Garden," the work of old Erasmus Darwin, was more popular in its day, and is less popular now, than it deserves to be. His "Temple of Nature," a posthumous publication, announces in "pompos rhyme" nearly the same views of evolution as those now in vogue.

many a defeat or triumph of the favorite. Here is to be seen many a country squire, looking well and hearty; many a fine old English gentleman, who never makes his appearance in the London world except on this occasion. Here are the same old shed-grooms who, ruminate and shake their heads, each with his private piece of information about the various animals, worth about as much as the blade of grass they are so continuously sucking. Here also are the various trainers, whose names are as household words to the sporting portion of the British aristocracy, and who are superintending their charges or making their criticisms.

Having feasted our eyes upon the cracks, and making up our minds which is to win, we wend our way to the course. The grandstand and enclosures are, as usual, thronged with distinguished personages. See, there is the future King of England with his lovely princess, surrounded by her maids of honor, who are almost as lovely as herself. There also is the Prime-minister of England standing by the side of his great political opponent, the illustrious author of "Lothair." But on this occasion all ill-feeling is cast aside, and they are talking together of the great event.

But hark! The bell has rung. They are about to start. All is intense excitement. The prince mixes with the peer, the peer with the peasant; lords and costermongers—all are looking toward one great goal. "Fordham wins!" "Go it, Blue Gown!" "Johnny Daley, Johnny Daley!" "Hurrah! Jimmy Grimshaw has won!" Up goes the flag. The race has been run in less than two and a half minutes. Thousands of pounds have been won—thousands have been lost. The rich has been made poor—the poor man rich. "Telle est la vie!" Little or no interest is taken in the minor events of the day, so we propose to wend our way homeward.

The "return" is the time to see the road to advantage. The foot-paths are crowded with suburbanites, all anxious to participate in the fun. And, of a surety, it is great fun. Many of the inmates of the carriages are dressed in a most grotesque manner. Huge noses, dolls stuck in the hats—any thing and every thing to cause merriment. All along the line, and especially by Clapham Common, bags of flour, rotten eggs, and other available articles, are thrown about. But this is a picture that must be seen to be believed. It cannot be portrayed in writing. So, "with the milk in the morning," come home those who were bent on having a spree, and thus ends the "Darby Day," the day of days to a Britisher.

S. ROMNEY ANDERSON.

THE MASSACRE IN THE PLACE VENDOME.

THERE was an hour on Wednesday, March 22, 1871, when every thing in Paris came to a dead stand-still. The city had received a shock. Omnibuses stopped—shops were shut—streets deserted—business suspended—the Bourse and the banks closed—and a thrill of terror ran through the inhabitants. "Have you heard what has just taken place?" said a friend to me; "a frightful massacre in the Place Vendôme!"

I could scarcely believe it, but it was too true! A body of unarmed, inoffensive citizens, in number about two thousand, had formed a procession, and were carrying a banner on which was inscribed, "Appel aux Amis de l'Ordre." After walking down the Boulevards, they entered the Place Vendôme by the Rue de la Paix. Here were posted, in great numbers, the rebel National Guards, whose hands were already stained with the cold-blooded murder of Generals Clement-Thomas and Lecomte. They barred the progress of these "friends of order." The latter tried to force their way. Upon this the command was given to fire. And immediately the cowards, who had run like sheep before the Prussians, fired, point-blank, into a dense body of their unarmed fellow-citizens, whose only crime was the making a pacific demonstration, and shouting "Vive la république!" "Vive l'ordre!" Immediately some fifty killed or wounded lay weltering in their blood. Among these were a banker, an American gentleman, a newspaper editor, an officer, etc., etc. The former, Monsieur Hottin-guer, was in the act of raising a wounded man, when he was shot through the lungs and arm. The crowd fled in all directions, carrying everywhere the tidings of this terrible onslaught.

At once doors and windows are closed. The Bourse, the shops, the *cafés* are speedily emptied, shutters fly up as if by magic, the "rappel" is sounded, and the surrounding streets are occupied by the

Garde Nationale, and terror spreads through Paris. Meanwhile, about a dozen unrecognized bodies of the murdered citizens were carried off to the morgue; on their way, the people meeting the mournful procession take off their hats, tears filling their eyes, and indignation their hearts, as they mutter, "Assassins," "brigands!" Shortly after the scene I have just described, I entered the Rue Castiglione, and, walking up to the sentry guarding the entrance to the Place Vendôme, was met with a stern refusal. I asked for the commanding officer, and showed him a card stamped with "Société Anglaise de Secours aux Paysans." Whereupon he allowed me to pass, sending a soldier with me. The agitation among the National Guards was still great. The man accompanying me declared a shot had first been fired at them; this, however, is untrue. He showed me the place of slaughter. The street and side-pavement were covered with blood. The *concierge* and servants of the house opposite the spot were mopping up the clotted gore. Every face was pale with terror. One tall, fine-looking man I specially noticed, who was greatly agitated, the drops of perspiration standing on his forehead as he muttered, "C'est affreux!—affreux!" I soon reached the guard keeping the entrance of the Rue de la Paix. Just at this moment an enormously stout man, like an English innkeeper, was being hustled by the crowd, and cries of "Prussien!" "espion!" were raised. Four or five National Guards surrounded and shoved him into the open space, where the officer on guard was appealed to. I must say the man behaved with the greatest *sang-froid*; for, though shoved and dragged, he still kept his hands in his pockets, and a cigar in his mouth, merely opposing his assailants by the *vis inertiae* of his own weight. He was marched off between National Guards. I was then allowed to pass the sentry, and found myself in the seething crowd, which I was glad to get through as soon as possible. They were mostly men in blouses, with savage and scowling faces, hideous with ferocity, beings that appear like stormy petrels on the wild waves of revolution. At the corners of the streets, groups were gathered, discussing the frightful event. Evidently the sympathy of most was with the murdered men. *Liberté, Egalité, Fraternité*, had received a terrible illustration. At this moment Paris is held by a body of brigands. One has often heard of travelling-parties falling under their power; but, for a city of two millions of inhabitants to be held in daily and nightly terror by a body of insurgents who have seized the Hôtel de Ville, the Mairies, the gates of Paris, and all the public offices, setting aside the government just elected by universal suffrage, is a sight the world has never before beheld! The rebels of Belleville and Montmartre, though numbering only one-tenth of the National Guard, have overawed the peaceable inhabitants and shopkeepers of the Boulevards and Rue de Rivoli, and the emasculated manhood of Paris. The end of this tragedy must soon come. Whether the government, backed by the provinces, and joining with the friends of order, can suppress these audacious rebels, with whom too many of the line have fraternized, or whether the Prussians will reënter Paris, will be a question settled ere this meets the eye of the reader. Red republicanism has given us its own interpretation of its motto. *Liberty* for themselves, is tyranny for others. *Equality*, is appropriating by violence their neighbors' honest earnings; and *Fraternity*, is to shoot down a brother whose views differ from their own! The position of France at this moment is reading a lesson to the world. That lesson is this—that the strength and prosperity of a nation are in proportion to its moral virtues. Decay begins within. The fall or collapse of a nation, whether from internal convulsion or external war, is the last stroke of the tempest bringing down the tree already rotten at the heart. The rampant spirit of red republicanism, riding rough-shod over established government and social order, is the same infidel spirit which, at the close of the last century, paid public worship to a courtesan dressed up as the Goddess of Reason. Individual judgment will take place hereafter, but national judgment takes place in *time*. Where religion, the observance of the Lord's-day, social virtue—honor, truth, morality—sink below the waves, can you wonder at an army being demoralized, or the manhood of a nation perishing and drawing down into the vortex its greatness and glory? It has been well said by no less a personage than the Archbishop of Paris: "The whole nation needs a moral change, to which misfortune does not yet appear to have led us. It is suffering from the vices which are dear to it, and which it does not consent to abandon. Love of labor, respect for law, the sentiment of duty, moderation, the spirit of concord, religious faith, the principles of virtue, do not return to the hearts of our people, and do not inspire social life as a whole.

Light and frivolous, we are more occupied in talking loudly, than in acting with constancy; and more occupied, indeed, in offering to act, than in arriving at durable results. There is neither study nor discipline—reflection is too much for us, the law weighs heavily on us, difficulties irritate us, we only admit convenient doctrines, in order that we may compose a doctrine still more convenient. Yet we have under our eyes a spectacle well fitted to awaken in us the ardor of a generous patriotism—to make us feel the need of seeking a refuge of moral grandeur. Around us are heaped up ruins which neither private nor public fortune can for a long time repair; fire, destruction, pillage, sadden and desolate thirty departments; our ancient standards, charged with so many victories, are now covered with mourning, and the foreigner marches insolently over the body of our mutilated country. . . . May God be persuaded by our supplications, and send us His spirit of counsel and wisdom, of strength and piety, that France may know what she wishes—may wish what she really wants, and do what she ought. May she be quickly healed of her wounds, which are chiefly moral ones, and return to religious belief; and, in consequence, to the practice of solid virtues, which are the real strength, the repose, and honor of a nation!"

EDWARD FORBES.

HELIOTROPES.

"True as the dial to the sun."—BARTON BOOTH.

NOWHERE in all Nature do we see the utter dependence of life on the bright, warm rays of the sun more clearly exhibited than in the large class of flowers which awake with the great orb, follow its course in the heavens, and sink into deep sleep when the night gains the victory. Early in the morning our white water-lily rises slowly from its dark couch below to the surface of the water, turning its chaste calyx toward the east; at noon it looks straight up, fully unfolded, and at night it once more closes its beautiful petals, turned to the west, and then sinks silently into the deep. But it is not only the poetical nymphæa, which thus pays allegiance to the sun; even less highly-gifted flowers, the very herbs of the field, acknowledge their dependence, and the wanderer, who in the evening approaches a blooming meadow from the east, sees not a single blossom on the green carpet, all the tiny, bright cups and clusters looking steadfastly toward the west. Nor is it the position only by which blossoms show their worship; the opening and closing of their petals also keeps pace with the progress of their great lord on high; every flower is in slow but steady motion; it has an hour of fullest unfolding, and another moment, twelve hours later, of complete closing. It is true the hour differs, but it returns generally with such unerring regularity that Linnæus could easily compose his flower-clock of plants, each of which opened its flowers precisely at a given time. It need not be said that, of course, temperature, moisture, and other climatic influences, frequently interfere with this punctuality. Some flowers are so sensitive to moisture in the air, that they close before the rain begins, and thus, like a certain marigold, serve as an unfailing barometer. Others close from excessive sensitiveness to light, whenever the sun hides for a few minutes behind dark clouds, and the majority of all flowers fall asleep during an eclipse of some duration. Even the leaves of composite plants partake of this marvellous susceptibility; a visit to our gardens in a dark night shows, by the help of a lantern, a number of locusts (acacias), the common clover, and the wood-sorrel, sleeping fast, with all their leaves folded up, as we close our eyelids. A strange feature in this sensitiveness is the capricious diversity among plants, of which some close and go to sleep—not at night, but in the heat of midday, while others bloom only at night, fearing the ardent rays of the sun, and, like the nymphæa, lotos, or the night-blooming cereus, unfolding their matchless beauty only to the chaste moon.

Plants which turn their fair faces consistently toward the sun, are known as heliotropes, aside from other features which assign them to certain families and classes. In olden days this curious habit of theirs was attributed to an occult sympathy between flowers and sunlight, as another sympathy of the same kind bound up other flowers with moonlight. Even Decandolle spoke only of "a stronger attraction of the sun on one side and a constant increase of evaporation," which caused the stem to twist and the flower to turn. But the connection is far more intimate, since even color and taste depend on the

bright light of the sun. Many plants, opening in the morning, are white till noon, when they turn red, and at times they assume even a third shade at night; others which have an acid taste at an early hour, taste sweetish when the day is advanced, and the whole process of life in plants must, therefore, depend upon light. Spectral analysis, the great discoverer of our day, has established the fact that the blue and violet rays of the prism alone produce these movements in plants, while the red and green rays merely profit by the newly-assumed position to further the activity of life, the coloring, the growth, and the maturing of the seed. Plants raised under a bell of red glass look healthy, but do not grow toward the light; under a blue bell they follow the rays of light, but remain stunted and etiolated.

Generally all plants exhibit a violent longing for light, and only a few, like ivy, ferns, and selaginellæ, turn with the night-blooming flowers toward the shade. Experiments have been made to test the power employed by plants for the purpose of reaching the light, when purposely kept in the shade, and the results have been astounding. Leaves of the vine twist, and turn, and stretch their leaf-stalks beyond all expectation, in order to catch some rays of the sun; the powerful stems of the sunflower show the same magic power; marigold and scabiosa, dandelion and chervil, all follow the sun with unwearied fidelity, and exhibit almost marvellous energy in their efforts.

This mysterious sympathy between plants and the great luminary that gives them life and beauty, and the power of unceasing regeneration, has from the beginning excited the imagination of men. It was this which led to the worship of the lotos in Egypt, and a kindred plant in India. The philosopher Proclus taught distinctly that the former, by opening its fair flower as the sun rose in the heavens, and by closing it when night came, proved its worship of the great God not less than man did by folding his hands and moving his lips in silent prayer. Hence all Egypt abounds with pictures and sculptures representing Horus sheltered by the gigantic blossoms of the *nymphaea stellata*. To the Indians the *nymphaea* was a symbol of creation, and Brahma, the Creator, floated in its magnificent calyx. Sir William Jones tells us, not without deep emotion, how great was his astonishment when he saw a native of Nepal bow low before the sacred flower which happened to stand in his office.

Ovid has a different account of the origin of heliotropes. He tells us of a fair daughter of the sea-god, Clytia, whom Apollo loved beyond all mortals and immortals. But in an evil hour he forgot her and gave his heart to another nymph, whom he deceived by assuming the form of her mother. Clytia, the Bright, filled with jealous rage, betrayed the poor child's sin to her parents, who buried her alive; but then came remorse, and nine days she remained crouching on the ground without food or drink, brooding over her sorrow and her misdeed. She never moved, only following the sun-god with her tearful countenance from morn till night; at last her fair form withered and wasted away, shrinking into a pale, sad-looking plant with a violet-shaped flower, where her face had once shown; and, although held fast by the root, the flower to this day never ceases to gaze at the great god in the heavens, preserving the ancient, unchanging affection.

What flower the poet may have meant, is not known. Pliny believes it to be the heliotrope of our day, "which," he says, "even on cloudy days, follows the course of the sun, so great is its affection for the great orb! At night the sky-blue flower closes as if overcome by its longing for the sun." Modern botanists believe that the poet had in his mind a more modest flower, often called sun-rose (*Helianthemum roseum*), with recumbent stem and flowers, not unlike the violets.

In Northern Europe, however, a far less poetical plant has been substituted. Here botanists almost unanimously designate the common blue chicory as the true representative of heliotropes. It was known of old already as the *Sponsa Solis*, the sun's bride, because it faithfully follows the sun all day long, even when the latter is hid behind dark clouds, and at night closes its petals. Legends, however, abound here also, telling of a faithful but forsaken maiden, who, in her lover's absence, still instinctively followed the sun day after day, hoping at every hour to see him return who had won her heart and broken it forever. The strange fact that an ant running over its blue petals turns them red in an instant—long looked upon as a miracle of Nature, but now ascribed to the acid of the insect—was happily explained as the maiden's blush in rare moments of returning consciousness, when she was ashamed of thus betraying to the world her unrequited love.

It is hardly necessary to add that no ancient writer could have meant the flower which in our day is proverbially taken as the representative of the heliotropes, the sunflower, since this gigantic plant, the flowers of which not unfrequently measure a foot in diameter, is a native of our own continent, and did not reach Europe till late in the sixteenth century. In vain did lovers of Ovid, in vain did poetical minds like Madame de Genlis, deny its American origin; botanists soon established the fact beyond all dispute, and a Spanish physician, Monardes, is quoted as the first author who, in 1583, spoke of the new plant. Unfortunately, besides, the sunflower is by no means as faithful in its allegiance to the sun as a true heliotrope ought to be; for wherever a number of them are found collected, as is now frequently the case in large plantations, used as safeguards against malaria, there are always a number of rebels to be seen, whose broad, staring faces turn everywhere else but toward the sun. The fact is that the flower owes its name to its resemblance to pictures of the sun in ancient art, and not to its imitation of genuine heliotropes.

The great naturalist Kircher was, therefore, utterly astray, when he proposed in his learned work a new, unerring clock, consisting of a kind of sundial, floating on the surface of a pond, with a hand to be guided by the regular motion of a sunflower.

Its enormous size and the almost incredible number of seeds, which furnish a rich, golden oil, made it soon a favorite with painters, who loved to introduce it in pictures of Paradise. As it reached Europe at a time when symbols and emblems were all the rage, it was, of course, soon pressed into service, and appeared everywhere in seals and devices. Turning toward the sun, as an emblem of perfect fidelity, with the motto "*Je suis*," it became in strange self-condemnation, the favorite of courtiers, and, best of all, held by the hand of a youth with bandaged eyes, it personified instinct.

As among men, so there are among plants also some which say:

"Let others hail the rising sun;
I bow to that whose race is run."

Heliotropes sometimes turn from the sun as anxiously as their sisters turn toward the great luminary, and we all know the beautiful jasmine of the Orient, which opens its fragrant snow-white blossoms only when the sun has disappeared in utter darkness, and drops the short-lived offspring with the first blush of morning. Hindostan immortalizes, in this shrub, the sad tree of botanists (*Nyctanthes arbor tristis*), a fair daughter of the land, whom the sun-god loved passionately, but only to deceive and leave her after a short period of ineffable happiness. She ended her life in despair, and her body was burned according to the custom of the land; from the ashes, however, sprang up the new tree, whose flowers ever since shun the sun, and cannot bear its bright light. So true it is that—

"the meanest flower that blows can give
Thoughts that do often lie too deep for tears."

SCHÉLE DE VERE.

SONNET.

ADDRESSED TO WILLIAM MORRIS, AFTER READING HIS "L'ENVOY" IN THE THIRD VOLUME OF HIS "EARTHLY PARADISE."

IN some fair realm unbound of time or space,
Where souls of all dead May-times, with their play
Of blissful winds, soft showers, and bird-notes gay,
Make mystic music in the flower-bright place—
Yea, there, O poets! * radiant face to face,
Keen heart to heart, beneath the enchanted day,
Ye meet, each hearkening to the other's lay,
With rapt, sweet eyes, and thoughts of Old-World grace:
"Son," saith the elder bard, "when thou wert born,
So yearned toward thine my spirit's fervency,
Flame-like its warmth on thy deep soul was shed;
Hence the ripe blood of England's lustier morn
Of song burns through thee; hence alone on thee
Fall the rich bays which bloomed round Chaucer's head!"

* Chaucer and the author of "The Earthly Paradise."

TABLE-TALK.

THERE is nothing conceivable more stale than an old newspaper or an old magazine. We refer to them for a date or a fact that has passed out of memory, but we hide them in garrets and out-of-the-way corners, we burn them, we sell them to the ragman and the trunk-maker. They had served us; they had contributed to our pleasure or our knowledge, and died, as truly as the plant that last year gave us fruit, or the summer that gave us beauty. Yet how much labor they have cost! How much genius lies forgotten between covers once brilliant, now faded and defaced! You will find in them verses by the first poets of the age, and essays by the most brilliant writers. But these can no more save them from the oblivion that awaits them than did the spices with which the old Egyptians stuffed their mummies save them from decay. And this is true, too, of books, though their life is not so ephemeral. The shelves of a library are like the grim shelves in the Catacombs of Paris, where you will see the skulls and bones of dead and forgotten generations that once had a life and possessed the world. The soul of books, like the spirit that once moved these nameless bones, will not be confined; and, when it has once departed, there is no cunning art that can bring it back. For every generation is a portion of the world's life, and the written thought a portion of that life expressed. And the newspaper, the magazine, and the book, which does not record the sympathies, the beliefs, the hopes, the fears, the aspirations, and the failures of the generation that produced them, is already dead. How difficult we find it to sympathize with the literature of a hundred years ago! The questions, the hopes, the follies, with which it dealt have been all disposed of by time. We like to know what men of that day thought and what they read, not from any sympathy with their intellectual life, but because we are curious to know what manner of men they were, how they dressed, how they lived, and how they died. They took with them their realities and their illusions, which had perplexed, or amused, or deceived them, to be succeeded by others not less perplexing and deceitful. At first sight it seems a hard fate that the world into which each generation comes must be to it an untried and experimental one; that it should find nothing settled, nothing stable. But a closer view proves this arrangement of things a most beneficent one. It gives to each age a distinctive character, a spirit, a life of its own, which it must develop and satisfy, and at last give up. How miserable would the world be if it were otherwise! How dreadful it would be for any of us to be always young, always the victim of illusions, of ignorance, and of passion! or always burdened with the cares, the anxieties, the responsibilities of middle life! How much more dreadful for the world if the monstrous theological doctrines that confound our age must be the plague of every succeeding age; or if the question of the rights of women in the state, or the question of human servitude, were to be the riddle, the perplexity of all genera-

tions! It is well, it is even necessary, that each generation, as does each man when he quits the world, should carry with it its questions, should only leave to its successor the simple duty which the Indian performs for his dead mate, the placing by its side, in its eternal resting-place, its weapons of hunting and of war. And what a world of trouble this saves us! We are not compelled, we are not even expected, to spend our lives with our ancestors, to keep alive their spirit, to enter into their lives. Leaving the dead to bury their dead, we are compelled to confront the Present and the Future. The field is unincumbered, ready for the new-comer. The new generation is the master of its own destiny as completely as if there had not been a hundred generations before it.

— The search for the picturesque, which soon will animate so many summer tourists, is often an unnecessarily fatiguing one, in consequence of a certain cardinal error which almost universally prevails among those who admire, or affect to admire, fine scenery. This error is the notion that the best prospects are obtained from the highest mountain-peaks. If simply extent of view be the object of the mountain visitor, then of course the higher his altitude the more sweeping is his survey. But prospects from very high mountain peaks lose in vastness of distance all individuality of form, all grouping and massing, all the variety of shade and color that gives to landscape its best charm. A vast space of country, when viewed from a great height, becomes nothing more than a map, dotted with forests, traced with rivers, and marked with scattered villages. The very same view will often have a much greater charm when seen from points halfway up the mountain. The forests then have form, and beautiful play of light and shade; the rivers, glancing through their willow-lined banks, reflect in lovely contrast tree and sky; and the villages, now well massed, show spire and gable through rich embowerings of green. And then any prospect is the more pleasing when seen with good foreground objects. Often, when ascending a mountain-road, the traveller is enchanted with a view of the valley below him, seen through arching trees, which proves a disappointment when spread out bald and map-like under what is called a more commanding position. Scenery is better revealed, like a woman's beauty, by being partially concealed; and, like a woman, it is coy, changeable, and even capricious. A view, delightful in the glancing lights and mellow shadows of a low sun, is meaningless in the downward rays of noon-day. One must not rush staring and precipitately upon a scene that he would enjoy; he must advance with deference and care; he must select with knowledge and taste his point of view, and he must understand the supreme art of enjoying more by attempting less. In every mountain-district there are guides or informants who, in their rude ideas of landscape art, invariably insist upon sending or leading the tourist to the spot that will show him the greatest space with the least real beauty. Let the lover of mountain scenery obey his own better instincts; and, searching out the less familiar and yet

more accessible rocks, have the genuine pleasure of a truly noble picture, instead of the wide, meaningless map the popular resort would lay out before him.

— The *Hartford Evening Post* has some sensible remarks on the evident increase of popular interest in science and in scientific speculations. It does not see in this tendency of the multitude any real danger to religion, and thinks there has been much unnecessary alarm on the subject. It is only an indication of growing culture, and of a laudable thirst for truth. The circle of scientists is no longer limited or exclusive; demonstration is not confined to the laboratory or lecture-room; and crowds throng the auditorium, and watch with intense interest the progress of investigation and discovery. Such men as Darwin, Huxley, Lyell, Herbert Spencer, and Lubbock, have made large contributions to the literature, and wonderfully enriched the thought of the age; and it is a sign of growing thoughtfulness, as well as of increasing earnestness in the search for truth, that their utterances are received and pondered by so vast an audience. But the listeners are not all disciples, by any means. So far as the explorers go by chart and compass, and bring their results to the test of actual demonstration, the seekers after truth readily go with them, and accept their teachings; but, when they venture into the unknowable and undemonstrable, the very mental constitution which has brought the audience together forbids their following when the clew of demonstration is lost. They may wonder at the temerity or applaud the intrepidity of the venturesome scholar; but they cease to follow. They may suffer themselves to be taken to the edge of demonstration, but not beyond; from the open sea of speculation they draw back. Whatever danger there may be in following the vagaries of speculative reasoners—danger of tossing up and down and toying with their fallacies and fancies, until the mind assimilates them—there is certainly none in following the demonstrations of science.

— A paragraph, copied from one of our foreign exchanges, to the effect that the Queen of Portugal is about to quit her husband, on account of his brutal treatment of her, has called out a contradiction from *The Washington Patriot*, whose editor was for several years United-States minister at Lisbon. *The Patriot* says—we have no doubt, truly—that “the King of Portugal is one of the most amiable of men, and in every sense devoted to the queen. As a tender husband and father, his life has been unexceptionable, and won golden opinions from his subjects and from the representatives of foreign governments, who have had an opportunity to know, with some degree of familiarity, his private habits and character. There is not a particle of truth in this or any other report of his alleged ‘brutality.’ The very reverse is true. The queen has suffered with a serious ailment for several years, which at times excites her nervous system to a dangerous degree. She is under constant medical treatment, and has been sent to the waters of Germany several times, but without permanent advantage. Superadded to these causes, the Portuguese court is not particu-

larly brilliant, and the internal condition of the country is bad from misgovernment, owing to the complete failure of the parliamentary experiment after the English model. It has been suggested that the return of the queen for a time to her native scenes and associations might perhaps produce a healing effect, and restore the calmness which nervous excitement often disturbs. And this is probably the only basis for an exaggeration which ascribes to the young queen a purpose of leaving her royal husband for harsh treatment."

— The rule regarding talk, "When you have nothing to say, say it," applies equally to writing. When you really have something to write about, do not peck and scratch round the subject like a hen; pounce upon it boldly like an eagle. Almost every article presented by unpractised writers to magazines—no matter how admirable the subject—drifts to leeward for one or two pages before the writer gets steerage-way on his thoughts, and the reader finds out where he wants to sail to. This fault could easily be avoided by proper revision. Cut out all that does not bear on the subject discussed; every useless adjective; every ineffective repetition of the same idea. Then consider whether you have said what you wanted to say in the best language at your command. If not, write on till you feel satisfied. Then condense and prune. Do not seek for striking metaphor or sprightly epigram, to decorate your article. If such occur naturally, they may be put in, but with caution. Consider whether you really gain anything by them; whether they really add force to your writing, or merely flatter your vanity at the time. Afterward, when all is done in the way of argument, you may here and there carefully add an apt quotation or pungent witticism, to attract attention and make some important sentence snap, like the cracker on a coach-whip. Remember, too, all the time, that facility in composition, as in all other accomplishments, can only be obtained by practice and perseverance.

"True grace, in writing, comes by art, not chance;
As they move easiest who have learned to dance."

— Our illustration on the first page of this number, from a painting by Zamacois, tells its own story pretty plainly, as do all the works of this eminent artist. The official in charge of a park has caught a youngster prowling about the grounds, and, suspecting him of plunder, makes him turn his pockets inside out, and show that he has "nothing in the hands, nothing in the pockets." The high position which Zamacois holds in contemporary French art is due to his wit and satire, to his brilliant coloring, and to something of the *bizarre* in his works. He sought his subjects generally in the sixteenth and seventeenth centuries, and in the life of monks, and friars, and priests in modern Italy. He is a painter of character rather than a creator of the beautiful, and seeks to express the comic rather than the ideal. But he is almost unrivalled among modern artists for his exquisite skill and perfect finish, as well as for a richness of coloring, of which, of course, our en-

graving can give no hint. It is now only a few months since art circles were pained and surprised by the announcement of his death.

— The author of the popular novels "Red as a Rose is She," "Cometh up as a Flower," and "Not wisely, but too well," is now known to be Miss Rhoda Broughton. Her next novel, which bears the singular title of "Good-by, Sweetheart," will commence in *Temple Bar* in June, and in the *JOURNAL* early in July.

Literary Notes.

MESSRS. CARLETON & LANAHAN have given to the American public a translation of M. Ernest Naville's "Problem of Evil," a work which has attracted no little attention abroad. M. Naville is an eloquent defender of evangelical religion, and his present work, which is in the form of lectures, treats a profound subject in an animated and popular manner.

"The Prince of Pulpit Orators" is an attempt to give a portraiture of the famous Methodist preacher Whitefield by means of a series of anecdotes and incidents. A book of this fragmentary character, if not of the highest nature, will often arrest the wearied attention, and pleasingly occupy an hour, when more pretentious volumes would be unsuitable.

The book-publishers in Madrid display an unusual activity just now. Two hundred new novels and a large number of historical and scientific books have been published in Madrid, Seville, and Barcelona, in the course of the last twelve months. The nineteenth edition of Jernan Caballero's novels is announced, and the twenty-third of a small volume containing a collection of Castellar's speeches.

"Money in the Garden" is the title of "a vegetable manual, prepared with a view to economy and profit," by Mr. P. T. Quinn, a practical gardener of great experience, whose former work, "Pear-culture for Profit," is already of standard authority. The present book has the valuable characteristics of thoroughness, condensation, and reliability.

Charles Victor Hugo has left the complete manuscript of the second volume of "Victor Hugo, *raconté par un témoin de sa vie*," the first volume of which was written by Victor Hugo's wife and published in 1863. Victor Hugo, however, desires that the second volume shall not be published until after his death.

Hermann Grimm, the German novelist and art critic, who served in the Prussian landwehr in the war against France, and was wounded at Saint-Privat, has arrived at his home in such feeble health that his death is looked for at an early day. His "Life of Michael Angelo" has been translated into five different languages.

The publisher of the Berlin *Kladderadatsch* (Punch) has recently been offered for that paper one hundred and fifty thousand thalers, but he refused to sell it. Twenty-three years ago *Kladderadatsch* was started by three young journalists, who had barely money enough to get the first number printed.

The Danish Government, having heard that Hans Christian Andersen intended to travel in the southern states of Europe, offered him for that purpose the sum of five hundred dollars, but Andersen declined it, say-

ing that he did not intend to leave Denmark any more.

The Schiller-Stiftung in Germany pays life pensions, ranging from one to five hundred thalers, to twenty-two eminent German authors or their widows and orphans, and granted sums of from fifty to five hundred thalers to needy authors in the year 1870.

"The Wonders of Engraving" is the latest volume in Scribner's "Library of Wonders," and contains not only a history of the art, but an interesting description of the various processes, with curious and singularly well-executed engravings.

Napoleon's recent pamphlet on the military reorganization of France is merely a reproduction of his essay on the Prussian army, published many years ago in the fifth volume of his complete works, with a new introduction.

A bookseller in Warsaw announces a new weekly periodical, to be called the *Polyglot Treasury*, and which will contain articles in seven different languages.

Julian Schmidt and Rudolph Gottschall, the two foremost literary critics of Germany, pronounce Gustav Freitag and Fritz Reuter the most gifted novelists of their country.

Professor Albert, of Vienna, has made important discoveries in regard to the spectral analysis, which will shortly be published in the *Austrian Chemical Journal*.

There are at Pesth, in Hungary, nineteen publishing-houses, most of which do a very large business.

Gustav Freitag, the author of "Debit and Credit," has in press a new novel, which will be entitled "On the Frontier."

Twenty-two hundred and eighteen books and pamphlets were published last year in Italy.

Magazines and reviews in eighteen different languages are published in Vienna.

A life of Sainte-Beuve, by his intimate friend Count Nieuwerkerke, is announced at Brussels.

Scientific Notes.

Is the Interior of the Earth solid or fluid?

ALTHOUGH the doctrine that the earth is a molten sphere, surrounded by a thin crust of solid matter, was once almost universally taught by geologists, there have of late years been brought forward several arguments to the contrary, which, apparently, are more in favor of its being a solid, or nearly a solid, mass throughout; and these arguments are fully entitled to our consideration, as our object is not to defend any particular theory, but to arrive, as nearly as we can, at the truth. I will, therefore, in the first place, proceed to scrutinize all which has been brought forward in opposition to the older hypothesis, and then to consider whether any other explanation yet advanced is more in accordance with the facts of the case.

First of all, we are to answer the question as to whether it is possible for such a thin crust to remain solid, and not at once to become melted up and absorbed into the much greater mass of molten matter beneath it? This latter would doubtless be the case, if the fluid mass had any means of keeping up its high tempera-

ture, independently of the amount of heat it actually possessed when it originally assumed the form of an igneous globe. The question, however, in reality, answers itself in the negative, since it is evident that no crust could even commence to form on the surface, unless the sphere itself was at the moment actually giving off more heat, from its outer surface to the surrounding atmosphere, than it could supply from its more central parts, in order to keep the whole in a perfectly fluid condition; so that, when once such a crust, however thin, had formed upon the surface, it is self-evident that it could not again become melted up or reabsorbed into the fluid mass below.

This external process, of solidification due to refrigeration, would then continue going on from the outside inward, until a thickness of crust had been attained sufficient to arrest, or neutralize (owing to its bad conductivity of heat), both the cooling action of the surrounding air and the loss of more heat from the molten mass within; and thus a stage would soon be arrived at when both these actions would so counterbalance one another, that the further cooling down of the earth could be all but arrested; a condition ruling at the present time, since the earth-surface, at this moment, so far from receiving any, or more than a minute amount of heat from the interior, appears to depend entirely, as regards its temperature, upon the heat which it receives from the sun's rays.

We have next to consider the argument that, if the earth's exterior were in reality only such a thin covering, or crust, like the shell of an egg, to which it has often been likened, such a thickness would be altogether insufficient to give to it that stability which we know it to possess, and that, consequently, it could never sustain the enormous weight of its mountain-ranges, such as, for example, the Himalayas of Asia, or the Andes of America, which are, as it were, masses of rock piled up high above its mean surface-level.

At first sight, this style of reasoning not only appears plausible, but even seems to threaten to upset the entire hypothesis altogether. It requires but little sober consideration, however, to prove that it is rather, so to speak, sensational in character than actually founded on the facts of the case; for it is only requisite for us to be able to form in our minds some tangible idea of the relative proportion which the size of even the highest mountain bears to that of the entire globe itself, to convince us, if such a crust could once form and support itself, that it could with ease support the weight of the mountains also. The great Himalayan chain of mountains rises to a maximum altitude of thirty-one thousand eight hundred and sixty feet, or six miles above the level of the sea; and, if the earth could be seen reduced in scale down to the size of an orange, to all intents and purposes it would look like an almost smooth ball, since even the highest mountains and deepest valleys upon its surface would present to the eye no greater inequalities in outline than the little pimples and hollows on the outside of the skin of an ordinary orange. If this thin crust of the earth can support itself, it is not at all likely to be crushed in by the, comparatively speaking, insignificant weight of our greatest mountain-chains; for, in point of fact, it would be quite as unreasonable to maintain such a disposition, as to declare that the shell of a hen's egg would be crushed in by simply laying a piece of a similar egg-shell upon its outside.

That a very thin spheroidal crust, or shell, enclosing a body of liquid matter, such as an ordinary fowl's egg, does possess in itself an

enormous degree of stability and power to resist pressure from without, is easily demonstrated by merely loading a small portion of its surface with weights, as long as it does not give way under them. Even when placed on its side (or least strong position), it is found that a portion of the shell, only one quarter of an inch square, will sustain several pounds weight without showing any symptoms of either cracking or crushing; or, in other words, this simple experiment indicates that, if the external crust of the earth were but as thick and strong in proportion as an egg-shell, it would be fully capable of sustaining masses, equal in volume and weight to many Himalayas, piled up one atop of another, without any danger whatever to its stability. — *Extract from a Lecture by David Forbes, F. R. S.*

To the Editor of Appleton's Journal:

On page 440 of *JOURNAL* for April 15th, Mr. Boyle, in his wonderful essay upon "Scenery of the Moon," inquires: "What has become of the water which must have formerly existed upon its surface?" and he infers a permanence in the quantity of that element upon our planet. Please allow me to ask a question related to this subject, from another stand-point: Whence came the water which is now a constituent of the rocks of the earth's crust?

Hitchcock's "Geology," 32d edition, p. 93, gives analyses of twenty-seven kinds of rocks, showing granite to contain 8 per cent. of water, and an average proportion of it in all rocks to be about 2.6 per cent. Here is certainly a hint of a process of absorption and secretion of water broad enough to affect the destiny of both earth and moon.

During the fused or heated condition of our planet no moisture could in any possible condition exist within it; and, with no reason for supposing it to have been increased or diminished, we may assume that the water as well as the oxygen then present must have been forcibly held aloof from the surface in a slowly-diminishing volume, governed strictly by the increasing receptivity of the planet by cooling.

The present volume of water about the earth Mr. Dana estimates to be equal to an envelope two miles in thickness, and if the cooled crust is but fifty miles in depth, and be supposed to have secreted but two per cent. of its bulk of water, we may confidently assume an earlier condition in the progress of our cycle, when the watery envelope was certainly five thousand feet deeper than to-day, and as certainly predict the entire absorption of the moisture of the surface of the earth when its crust shall have doubled its present thickness.

This reduction is incessant, probably of uniform rate, and follows natural laws. Water presses downward, and invades every pore and cavity of rock with the persistence of five thousand pounds per square inch upon the mean depth of ocean-bed (ten thousand feet). There is a line of fierce strife within the surface where water steadily and successfully attacks, and where fire desperately and fitfully repels, with sorties at times, as volcanic eruptions, of frightful energy, which follow some new and deeper encroachment of the water.

All force and action are parts of an effort to reach an exact balance, or equilibrium. "All matter must oxidize or crystallize." Perhaps the crystallization of all gases and liquids into the solids for which they have affinities will be the completion of the grand cycle of terrestrial forces and matter.

M. Poisson, quoted by Dana, asserts that the earth is millions of years in losing one degree of its internal heat, and, as the absorption of moisture follows only upon that reduction, a

cycle of years which should complete the process, could only be stated by an array of figures outrunning human comprehension.

That the moon had formerly an atmosphere and seas, is little doubted. The spectroscope shows it to have the same mineralogical character as the other planetary bodies, suggesting corresponding elements and life. That it is now utterly barren and void of surface-moisture, is generally believed; and it is assumed that, by reason of its lesser size, it has only so much sooner passed through the several mechanical stages of a destiny which is at once the type and prophecy of the earth's ultimate condition of exhaustion and rest.

W. D. H.

Liquid for Electric Batteries.

According to Dr. Bradley, there is a wide difference in the composition of these liquids. We subjoin some of the most approved admixtures:

One consists of 800 grammes water, 50 grammes bichromate of potash, 50 grammes sulphuric acid, and 2 grammes chromic acid.

McCracken liquid: 1 pound bichromate of potash, 1 gallon of water, 8 pounds sulphuric acid.

Poggendorff liquid: 3 pounds bichromate of potash, 4 pounds concentrated sulphuric acid, 8 pounds (1 gallon) water.

United States Telegraph Company's liquid: 5 gallons water, 6 pounds bichromate of potash, 1 gallon sulphuric acid.

Western Union Telegraph Company's liquid: 18 pounds water, 1 pound saturated solution of bichromate of potash, 1 pound sulphuric acid.

Newton's solution for destroying organic matter: 12 fluidounces water, 1 fluidounce sulphuric acid, 1 ounce bichromate of potash.

Remedy for Festering Wounds and Cancers.

Professor Böttger recommends gun-cotton, saturated with a solution of permanganate of potash, put up in the form of a poultice, and held over an open wound by a bandage, as the best disinfectant for bad odors that can be conveniently applied. The strength of the solution of permanganate, best adapted for the purpose, is one part, by weight, of dry salt in one hundred parts of water. Ordinary cotton cannot be taken, as it readily decomposes; but gun-cotton is permanent, and not liable to explosion when in a moist state.

Foreign Items.

THE Queen of Prussia noticed last year that a good deal of her valuable jewelry disappeared in a mysterious manner, and all efforts to discover the thief proved fruitless. It was finally ascertained that one of her little grandchildren had taken the diamond rings and bracelets and concealed them among its toys in order to play with them. It is believed in Berlin that this affair had something to do with the suicide of the queen's master of ceremonies, who shot himself some time ago at Berlin, and for whose suicide no satisfactory reasons have as yet been given.

Among the princesses of Europe, the Empress of Russia, and the Princess Frederick Charles, are the best painters, the Princess of Wales the best performer on the piano, the Queen of Holland the best poet and author, the Crown-Princess of Prussia the best manager of fairs and public festivities, the Empress of Germany the best conversational-

ist, the Empress of Austria the best-looking lady, and the Queen of Denmark the best housewife. So says Madame Rattazzi in one of her recent novels.

Leverrier, the great French astronomer, is lying hopelessly sick of consumption, at Toulon. An acquaintance, who visited him recently there, spoke to him about the injustice of the Paris *savants*, who denied that Leverrier had rendered any services to science while at the head of the Imperial Observatory. "Oh," exclaimed Leverrier, with a bitter smile, "I have no doubt they will soon deny that I discovered the planet Neptune!"

A deputation of citizens from Kiev, having recently requested of the Czar Alexander II. an enlargement of the liberties of the press, the emperor replied to them quite angrily that, ever since his accession, he had facilitated the appearance of new journals, and that, while in 1855, Russia had less than a dozen periodicals, there were now over three hundred, and that the country had all the freedom of the press it needed.

The death of M. de Germiny, for many years president of the Bank of France, deprives that country of its ablest financier. After the downfall of the empire in September, 1870, Gambetta offered him, in spite of his imperialist proclivities, the portfolio of finance, but Germiny declined it. He began life as a journalist, but soon became a very successful speculator at the Bourse, and died a millionaire.

One Gogny, in Paris, announces in the papers that he has been engaged for two months past in organizing in that city a club, whose members would have to visit every day the leading *cafés*, and insult there the German guests; he also calls upon all travelling agents and drummers to join a league whose members would bind themselves not to stop at any hotels in France where Germans would be admitted.

A new play written by Victorie Sardoun has been rejected by the managers of the Théâtre Français, to whom he offered it. They wrote him that they considered it best not to have any of his plays represented for some time to come. This made him so indignant that he replied that henceforth he would not allow any of his plays to be performed at the Théâtre Français.

Anthony Probsthaher, the last survivor of Lützow's famous raiders of 1813, and who carried the mortally-wounded Theodor Körner, the German poet and dramatist, out of the range of the French bullets, celebrated, a few weeks ago, his golden wedding at Fuerstenberg in Germany, where he is director of the city lyceum.

A man in Berlin, who made a great deal of money last year by selling what purported to be autograph letters of the prominent statesmen and generals of Germany, France, and England, has been sentenced to six months' imprisonment, it having turned out that he himself wrote most of the letters.

The hall in the palace at Versailles, where the French National Assembly now holds its sessions, is the one in which Louis XIV. held his grand receptions, and where the Gardes du Corps, under Louis XVI., held the banquet which led to the compulsory return of the royal family to Paris.

The *tantômes* which Verdi has thus far received from the managers of various Euro-

pean opera-houses for his "Trovatore," amount to two hundred and eighty-nine thousand one hundred and twelve lire, or over nine times as much as Mozart received for all his operas.

Justus von Liebig has asked the King of Bavaria to grant the sum of three hundred thousand florins for the construction of a new chemical laboratory in Munich, and the king has consented. This new laboratory will be the largest of its kind in Europe.

Raimbeau, Napoleon's equerry, who, in 1867, saved the life of the Emperor Alexander II. of Russia by his presence of mind, at the time when Bereowsky, the Pole, fired at the czar, has been appointed lieutenant-colonel in the Russian cuirassiers of the guard.

It is believed on the Continent that the fashionable watering-places in Germany will be crowded this season as never before. At Carlsbad, Baden-Baden, Kissingen, Homburg, and Ems, it is even now difficult to secure eligible quarters.

Paris has at present no public executioner, M. Heidenrix having resigned that position during the siege of the city, and the minister of justice having refused to appoint his successor. During his official career Heidenrix beheaded fourteen persons.

Mirès, the famous French banker, whose death at Marseilles was reported some time ago and afterward denied, was believed to be the wealthiest man in France next to the Rothschilds and the Duke de Lhuynes.

An assassin recently attacked M. Katkoff, editor of the *Moscow Gazette*, and by far the ablest journalist in Russia, and wounded him severely. Political hostility was the cause of the attack.

Assy, the secretary of the great Workingmen's League, *l'Internationale*, and who planned the revolt of the red republicans of Paris, is himself no working-man at all, but the son of a nobleman.

Urbano Rattazzi, the Italian statesman, has purchased the Villa Zanfrini in Rome, where he will henceforth reside permanently. He is believed to be the wealthiest of the prominent public men of Italy.

Prince Charles of Roumania has become so unpopular in his country that he does not venture any more to go to the theatre at Bucharest, for fear of being insulted by the audience.

They say in Paris that the civil list of Louis Napoleon owes the Rothschilds three or four million francs, and that the ex-emperor has informed them that he is at the present time unable to pay that debt.

They say that a son of Napoleon I. and Mademoiselle Georges, the celebrated actress, who died several years ago in poverty at Paris, is one of the custodians in the National Library in that city.

Don Francisco de Assisis, consort of ex-Queen Isabella of Spain, is so tired of living abroad that he has applied to King Amadeo for permission to return to Spain.

The youngest daughter of Giacomo Meyerbeer, the composer of "The Huguenots," has been married to a grandson of Scribe, the French dramatist.

The Austrian Archduke Charles, the victor of Custoza, is affected with an eye-disease, in

consequence of which he has been unable to read and write for over a year past.

Madame Miramon lives with her children at Brussels, in the house formerly occupied by Victor Hugo, and in which he wrote the first part of "Les Misérables."

The Emperor of Austria has declined the invitation of the Emperor of Germany to be present at the triumphant entry of the German troops into Berlin.

Hedwig Raabe, and Niemann, the greatest living tenor, have not been married, as some journals have reported, but both are coming to the United States.

Lamartine's niece, the last member of the family of the great French poet, and who nursed him so faithfully during his last sickness, is dead.

Thiers has consented to pay a large pecuniary indemnity to the family of the Prussian Lieutenant Hart, who was unjustly shot as a spy in Paris during the recent war.

The fifty horses of the Emperor Napoleon, which were captured after the capitulation of Sedan, have been distributed among the sovereigns of the various German states.

The Italian Antiquarian Association solicits contributions for a fund to be devoted to a more thorough pursuit of the excavations at Pompeii.

The grand-duke of Mecklenburg-Schwerin has given the sum of one thousand thalers to the widow of every Mecklenburg soldier killed in France.

Bismarck is now a prince. The Emperor William intended to make him Prince of Strasbourg or Alsace, but Bismarck preferred to be simply called Prince Bismarck.

An illegitimate son of Bernadotte, afterward King of Sweden, is first violinist of the orchestra at the Scala Theatre in Milan. He calls himself Ponte Corvo.

The Prussian protest against the anti-Jew orders of the Royal Consistory has been signed by nearly one hundred and fifty thousand electors.

Gervinus, who died some weeks ago at Heidelberg, left his family in very humble circumstances.

The daughters of Proudhon, the famous French socialist and philosopher, eke out a scanty living at St.-Denis as *blanchisseuses*.

Strousberg, the "railroad king" of Prussia, has settled with his creditors, and has again control of all his property.

During the siege, Paris had seventeen daily papers, after the armistice twenty-nine, and during the rouge revolt sixteen.

Archbishop Darboy, of Paris, is a nephew of the celebrated Royer-Collard, and a distant relative of Casimir Périer.

The Masonic Grand Lodge in Paris has rescinded the resolution expelling the Emperor William from the order.

Count von Beust has won a suit for defamation against an editor who had charged him with being an inveterate gambler.

A great-grand-daughter of J. G. von Herder, the eminent German author, is living in very humble circumstances at Weimar.

Emilio Castellar, the great Spanish orator

and republican leader, recently lost his mother and three sisters.

Gambetta will remain a year in Spain, in order to recover his health.

Nine cities in Germany and two in Italy have Lincoln Streets.

Dr. Nélaton, the celebrated French surgeon, has removed to London.

Emmanuel Geibel, the German poet, is lying dangerously sick at Lubeck.

The new tutor of the sons of the Viceroy of Egypt is an American.

Miscellany.

Christian Names.

TO the various Teutonic tribes—the Saxons, Angles, and Jutes—which came over to this country (England) in the fifth and sixth centuries, and which were at length fused into the Anglo-Saxon race, we owe our really national names. A great variety of personal titles existed among the Anglo-Saxons; for, while their language in general became in course of time accommodated to a common standard, the names applied to individuals among them retained all their original dialectic varieties. These older Teuton titles are now, however, to be sought rather in the lists of our surnames than in those of our personal appellations. But of the names which were of strictly Anglo-Saxon origin, and which were mostly compound words, many have continued to be employed largely at baptism down to our own time; and these, too, in their transit across the period when surnames were gradually spreading downward from the higher to the lower classes, passed freely into family denominations. *Eduard* will at once occur to the reader as among the foremost names of the division we are now considering. *Edward* seems to have been unfailingly popular ever since the period of Saxon rule. It has originated several surnames, one of which, viz., *Edwards*, has belonged to great numbers of persons. The registrar-general has shown that this cognomen stands number twenty as regards commonness among the surnames of England and Wales. The family names *Tedd*, *Edson*, *Edkins*, and *Eduardson*, are also derivatives of the baptismal name *Edward*; so again, perhaps, are *Edison*, *Eddy*, and others. *Edward*, as a personal title, is now proportionately much more frequent in Wales than in England, just as the surname *Edwards* is far commoner there than here. To cite other cases in which Anglo-Saxon titles have come down to us in a probably unbroken line of usage, there is *Alfred*, with its corresponding surnames, *Alfred*, *Alfrey*, *Alverd*, *Albert*; *Edmund*, with a still larger family of derivatives; *Cuthbert*, which is represented in at least three forms among hereditary titles; and *Edgar*, appearing, we believe, only in its original shape in the lists of surnames. To these, many others might, of course, be added; but we need not multiply examples.

The Normans made popular in England an entirely new set of Teutonic Christian names, and among them are to be found many that are now oftenest employed as personal designations. Most prominent of all is the name *William*—that of the Norman Conqueror himself. We shall presently give the reader a notion of the relations in which some of our more ordinary Christian names stand to each other in the matter of frequency; for the present, it is suf-

ficient to say that, of men's names, *William* is in all probability borne by a larger number of persons in England and Wales than any other. It is not uninteresting to note the meaning of the word on which this our principal male title is based. *Willi* was one of the three primeval Teuton deities who together performed the creation of mankind. He was a personification of *will*—not only of inclination (*voluntas*), but of *impetus* also. Among an enterprising and determined race, such as ours, therefore, the name *William* is fittingly conspicuous. But, unfortunately, it must be confessed that its frequency in England denotes no general reference at the time of its importation to the original signification of its root; on the contrary, that frequency merely represents an inclination, universally shown among the vanquished Anglo-Saxons, to imitate the titles that were fashionable in the families of their victors. *Henry* is another still common name of Norman introduction—*Harry* being, as Miss Yonge says, "its right native shape," and the surnames derived from this form of the word (viz., *Harries*, *Harris*, *Harrison*, *Parry*) belonging to a much larger number of people than the derivatives of *Henry*, which latter way of spelling is only an imitation of the French mode, *Henri*. *Robert* is also a title imported at the time of the conquest, and one which continues to be prominent. *Walter*, again, dates from the same era as its introduction among us, but is now considerably less used than the preceding name; while *Gilbert*, and many other Norman titles which are of common occurrence in "Doomsday Book," have in our day fallen into the background as Christian names.

The crusading period gave us *John*, which now competes, and in some years it would seem successfully, with *William* for predominance among the baptismal names of men. As a patronymic (i. e., in the form of *Jones*) it has outrun *William* (or *Williams*) completely, and dares to dispute with *Smith* the honor of naming more individuals among our countrymen than any other family cognomen. *John* was, of course, in the first instance, employed in reference to its saintly associations; but, once naturalized in this connection, it soon ceased to express religious feeling, and was simply given to the son because his father bore it.

Passing on through the later middle ages, we come upon another saintly title, which now appears to be more prevalent in this country than any other, either male or female. This is *Mary*. The adoration of the Virgin Mother in pre-Reformation days has made a mark upon our nomenclature which no subsequent sentiment, whether Puritanic or otherwise, has been able to efface. *Mary* is an existing surname, and the baptismal title appears, at least, to have created other surnames, as *Marrian*, *Mariott*, *Marryat*, *Maryon*, etc.; but some doubt hangs over the derivation of these words, and it has been supposed, indeed, that *Mary* as a family title owns no connection with the personal name, but that it may be identical with the ancient Anglo-Saxon word *mære*, signifying a horse.

Thomas Law.

One of the most notable of the social celebrities of Washington, in the early part of this century, was an Englishman named Thomas Law. He was a younger brother of Lord Ellenborough, who had succeeded Lord Kenyon as Lord Chief Justice of the King's Bench, being raised to the peerage on his accession to the dignity of Lord Chancellor of England, a second brother being Bishop of Bath and Wells. Mr. Law's early life was passed in In-

dia with Lord Cornwallis, holding there a high civil trust, which he discharged with signal ability, receiving, on the resignation of his office, many gratifying testimonials to the beneficence of his rule. Infected by the spirit of liberty then moving all nations, Mr. Law's enthusiasm was roused in favor of republican institutions, and, inspired with ardent admiration for the character of Washington, he came to America; having, however, no political affinities whatever in this country. He attracted much attention from his fine person, aristocratic connections, and undoubted genius, and also from his wealth, which, accumulated in the golden days of India, was dissipated chiefly through building-speculations, for which he had a mania; while he was also generous—prodigal, indeed—in good works, as in the hospitalities dispensed at his country-seat near Washington. Mr. Law married Miss Anne Custis, sister of the well-known George Washington Parke Custis, of Arlington, the adopted son of Washington; but his numerous peculiarities unfitted him for domestic life. His eccentricities were many—one of his habits being to carry in his hand a piece of dough, which he constantly manipulated, the loss of which would cause him to lose the thread of his story. His absence of mind was at times inconvenient, being obliged, when asking on one occasion at the post-office for his letters, to confess that he did not remember his name; but a few moments afterward, meeting a friend who saluted him as Mr. Law, he hurried back, gave his address, and received his mail. Another more embarrassing instance of his distract faculties occurred at Berkeley Springs, where, after a bath, forgetting to dress, he appeared in the crowded grove *in puris naturalibus*, scattering consternation among the promenaders.

Impromptu.

A certain poet (Pierre Dupont), wishing to visit M. Victor Hugo, and not knowing him, wrote the following *impromptu* on his card, and sent it up to the great romancer:

"Si tu voyais une anémone,
Langueuse et près de périr,
Se demander, comme une aumône,
Une goutte d'eau, pour fleurir;

"Si tu voyais une hirondelle,
Un jour d'hiver te supplier,
A ta vitre battre de l'aile,
Demander place à ton foyer—

"L'hirondelle aurait sa retraite,
L'anémone sa goutte d'eau.
Pour toi que ne suis-je, O poète!
Ou l'humble fleur, ou l'humble oiseau?"

Let us try to translate it:

"Should some anemone implore—
When languishing and like to die—
A drop of water to restore
Its fragrance, as thou passest by;

"Or should some trembling swallow beat
Its wing against thy wintry pane,
And ask some hospitable heat
To warm it back to life again—

"That swallow would not beat unheard;
That flower would bloom beneath thy care:
Why am not I or flower or bird,
To win, O poet, entrance there?"

M. M.

Poisonous Fishes.

The noxious properties of some fishes are supposed to be dependent on the nature of their food. Munier, in a letter to the well-known naturalist, Sonnerat, written nearly a century ago, states that in Bourbon, and in Mauritius, none of the genus *Scarus*, or parrot-fishes, which in those islands are called by the popular names of *vielle*, or old wife, perro-

quet, etc., are eaten between December and the beginning of April, being regarded as unwholesome during that period, because they then eat large quantities of coral-polyps. This statement is in part confirmed by Commerçon, who, regarding the cataubleu (*Scarus capitaneus*), says that it gnaws the coral, and is consequently looked upon as a suspicious article of diet, both in the Ile-de-France and in Bourbon. The natives of Bombay are said to reject another species of *Scarus* (*S. harid*) for the same reason. Other forms of animal life, as the beautiful medusa, or jelly-fish, known as the stephanomia, and the well-known Portuguese men-of-war, or physalia, when eaten by fishes, seem also to render the latter unfit for human food, probably on account of their acrid and irritating properties. Risso describes a Mediterranean fish, called Courpata by the Nice fishermen, which cannot safely be eaten at the periods during which it feeds on this medusa, and the sardine of the Antilles (*Harengula humoralis*), is so poisonous, after feeding on the physalia, as to occasion death in a few minutes. The common herring is sometimes very unwholesome, although perhaps scarcely poisonous, in consequence of its living on certain minute worms, which are occasionally so abundant in the North Sea as to give a red tint to the water. Notwithstanding the abominations greedily devoured by eels, these fishes may generally be eaten with impunity. There are, however, occasional instances in which they prove deleterious, and M. Virey, in describing a case in which a whole family were attacked with violent pains and diarrhoea, a few hours after eating eels taken from a stagnant castle-ditch, near Orleans, refers to several similar accidents.

Raw Silk.

The following table gives the estimated production of raw silk in the several silk-producing countries of the world:

Chinese Empire.....	\$81,200,000
Japan	17,000,000
Persia	5,000,000
Asia Minor.....	5,200,000
Syria.....	1,800,000
Toorkistan (Chinese).....	400,000
Toorkistan.....	1,400,000
Corean Archipelago.....	100,000
France.....	25,600,000
Italy.....	39,200,000
Turkey in Europe.....	7,000,000
Spain and Portugal.....	3,200,000
Pontifical States.....	1,300,000
Greece.....	840,000
Morocco	300,000
Austria.....	1,280,000
India.....	24,000,000
America.....	80,000

Total.....\$214,900,000

Holker Hall.

Holker Hall, one of the stately seats of the Duke of Devonshire, near Ulverstone, has been destroyed by fire, with a fine library, and nearly the whole of a valuable collection of paintings. The pecuniary loss is over two hundred and fifty thousand dollars; but what gives the occurrence more interest than this trifling damage to the duke's immense estate is the fact that this was one of those grand old mansions whose associations reach far back in the history of England. It was the family mansion of the Prestons in the reign of Elizabeth, and passed from them to the Lawthers. The duke himself was staying at the hall when the fire occurred, and succeeded in saving one choice painting by having it cut from the frame, which was too large to be passed through a window.

Varieties.

S^T. JEROME mentions a widow who married her twenty-third husband, who, in his turn, had been married to twenty wives. A woman named Elizabeth Massi, who died at Florence in 1786, had been married to seven husbands, all of whom she outlived. She espoused the last at the mature age of sixty. When on her death-bed, she recalled the good and bad points in each of her husbands, and having impartially weighed them in the balance, she singled out her fifth spouse as her favorite, and desired that her remains might be interred near his. The death of a soldier is recorded in 1784, who had five wives, and his widow, aged ninety, wept over the grave of her fourth husband.

The reports concerning the cotton-factory at Augusta, Georgia, are gratifying, and show the encouraging prospects of Southern manufacture. This factory has been gradually extending its operations, till now it runs 15,000 spindles and 600 looms, and consumes 130 bales of cotton per week. The average daily product is 524 yards per loom, or 25,000 yards in all, making some eight million yards yearly. At its organization the company had \$200,000 capital, which, by its earnings, has increased to \$600,000. The par value of the stock is \$100, on which it has paid for five years past an annual dividend of twenty per cent. The stock is now worth \$155.

Queen Victoria has been noted for affably bowing without a moment's cessation in her state progresses through the city. A London correspondent of the *St. Louis Republican* says this bowing is all a deceit. "There is a curious contrivance attached to the seat of the royal carriage, by whose means the royal body is gently swayed as in the act of bowing, while in reality the said body lolls comfortably and makes no exertion whatever." Some Yankee has but to invent a hand-shaking machine, to earn the eternal gratitude of all American public men.

The following little nursery-rhyme deserves to be incorporated into "Mother Goose's Melodies:"

"There was a little girl,
And she had a little curl
That hung right down on her forehead;
And when she was good
She was very good, indeed,
But when she was bad, she was horrid."

Von Moltke can speak every dialect and language of Europe.

A resident of Salem, Mass., is very angry with some young jovial friends of his who, the other day, for the sake of the joke, caused him to be annoyed by a long procession of callers, including two expressmen, a man with a load of wood, another with furniture, a third with a bundle of hay, a colored barber, a grocer with a can of oil, and finally a hearse and two carriages to attend his funeral.

It is said that Boston, Worcester, Lawrence, and Fall River, the four largest towns in Massachusetts, are no longer genuine Yankee communities, as none have so many native-born inhabitants as foreigners. In Boston, for instance, out of 248,866 inhabitants 158,116 have either or both parents of foreign birth.

They have temperance insurance societies in Georgia, which are somewhat original. Each member pays five dollars as an initiation-fee and five dollars dues each month. At the end of the year the money is divided among those who have remained faithful to the pledge.

A live cat was found in the mail-bag at a town in Maine one day last week. The postmaster made diligent search through all the United States postage-laws to ascertain the amount of postage on the animal, but found nothing touching the case.

North Carolina has "an old man of the mountains," who lives about forty miles from Greenville, and has reached the age of one hundred and forty-three years. At the time of Braddock's defeat he was twenty years old, and had a wife and three children.

Gladstone is reported to be in straitened financial circumstances. He has recently been

forced to sell most of his private property to meet his obligations, incurred, it is stated, by his liberal mode of entertaining.

A Washington man has won five hundred dollars by eating a partridge every day, between 9 and 10 A. M., for a month. According to the terms of the wager, he could eat any thing else he liked.

The Western States are, one after the other, abolishing the old rule of paying women school-teachers less than men for the same services. This is simple justice.

Philadelphia has six thousand manufacturing establishments of all kinds, which give employment to one hundred and twenty thousand men, women, and children.

It is said that out of twenty-one millions of Italians, seventeen millions are still unable to read or write.

A lady at Schenectady advertises her fugitive husband, and declares she will pay no more of his debts.

A conclusive argument against suicide is, that it is the height of impoliteness to go anywhere till you are sent for.

In the reign of Francis I., more than one hundred thousand witches are said to have been put to death.

Blot says, wrinkles are produced by the want of a variety of food. That's a new wrinkle.

The assertion is made that more than one-half the hotels of the country are kept by natives of New Hampshire and Vermont.

About six thousand women have so far signed the memorials to Congress, asking that suffrage should not be extended to their sex.

The Girard College in Philadelphia is said to be the best specimen of Grecian architecture in the world.

About fifteen million dollars' worth of artificial flowers are used annually in America. They are chiefly made in France.

A young lady of Cincinnati last year made twelve hundred dollars profit out of her sewing-machine.

Is it proper to say of an artist just verging on delirium tremens, that he is putting the finishing touches to a colossal bust?

Mlle. Henrietta d'Angeville, the first lady who ever made the ascent of Mont Blanc, died at Lausanne, lately, aged seventy-seven.

A merchant should always have a partner, if he wishes to conduct his business on a "firm" basis.

Brigham Young is said to have lost twenty-seven mothers-in-law in five years.

"The mob of Paris rings the neck of France."—*Dr. O. W. Holmes.*

Seventy-eight women are now regularly ordained preachers in the United States.

A tea-totaller—The man who drinks nothing but tea.

Net-proceeds—Fish.

Strange faces—Masks.

A military air—A pla-toon.

The Museum.

WE give this week an illustration representing a Kaffre chief in his full war-uniform. He bears on his left arm a great war-shield, the color, when white, denoting that he is a married man. The long, slender feather which is fastened in his head-ring is that of the South-African crane, and is a conventional symbol of war. The whole person of the chief is nearly covered with barbaric ornaments. His apron is made of leopards' tails, and his knees and ankles are decorated with tufts made of the long, flowing hair of the Angora goat. Twisted strips of rare furs hang

from his neck and chest, while his right hand holds the long knob-kerrie which is so much in use among the Zulu warriors. The councillors who stand behind him are appalled with nearly as much gorgeousness as their chief, all wearing plenty of feathers on their heads. The different-shaped head-dresses which these subordinates wear indicate the regiments to which they belong. This group is engraved from a photograph of a famous Kaffre chief, Goza, and his two principal councillors. The Kaffre warriors are divided into two great groups—namely, the married men and the bachelors, or, as they are popularly called, the “men” and the “boys.” But each of these great groups, or divisions, if we may use that word in its military sense, is composed of several regiments, varying from six hundred to a thousand or more in strength. Each of these regiments inhabits a single military *kraal*, or garrison-town, and is command-

Kaffre Chief in his War-dress.

ed by the head man of that *kraal*. Moreover, the regiments are subdivided into companies, each of which is under the command of an officer of lower grade; and so thoroughly is this system carried out that European soldiers feel almost startled when they find that these savages have organized a system of army-management nearly identical with their own. The regiments are almost invariably called by the name of some animal, and the soldiers are placed in them according to their physical characteristics. Thus, the Elephant Regiment consists of the largest and strongest warriors; then, the Lion Regiment is composed of men who have distinguished themselves by special acts of daring; while the Springbok Regiment would be formed of men noted for their activity. There are twenty-six of these regiments in the Zulu army, and they can be easily distinguished by their uniform.

PATENT DAMPENING TABLETS,

For Copying Letters and Legal Documents.

R. HOE & CO.,
29 & 31 GOLD ST., NEW YORK.

STARR & MARCUS,

22 JOHN STREET, UP STAIRS,

OFFER AN

UNEQUALLED ASSORTMENT

OF THE

Gorham Mf'g Co. STERLING SILVER-WARE,

Comprising all their newest and most desirable patterns in Dinner, Tea, and Dessert Services, as well as Table Silver of endless variety. The experience of forty years, as Practical Silversmiths, has won for the goods of their manufacture a REPUTATION UNAPPROACHED BY ANY OTHER HOUSE.

The Gorham Factory possesses all the newest and most ingenious labor-saving machinery, employing hundreds of hands, skilled in designing, modelling, and finishing, thereby PRODUCING IN LARGE QUANTITIES, ON THE MOST ECONOMICAL BASIS, goods beautiful in design, and of unsurpassed finish, which are guaranteed of sterling purity by United States Mint Assay.

A complete assortment of Gorham Electroplate on Nickel Silver, at prices established by the Company.

RALPH THE HEIR.

By ANTHONY TROLLOPE.

[“RALPH THE HEIR,” SUPPLEMENT No. XXII.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF APRIL 29.]

CHAPTER LII.—Continued.

“Neeft has gone mad lately,” said Captain Fooks, with a good-natured determination to stand by his friend in misfortune.

“But how about the girl, Newton?” asked his lordship.

“You may have her yourself, Poll—if she don’t prefer a young shoemaker, to whom I believe she’s engaged. She’s very pretty, and has got a lot of money—which will suit you to a T.” He tried to put a good face on it; but, nevertheless, he was very hot and red in the face.

“I’d put a stop to this if I were you,” said another friend, confidentially, and in a whisper. “He’s not only telling everybody, but writing letters about it.”

“Oh, I know,” said Ralph. “How can I help what a madman does? It’s a bore, of course.”

Then he sauntered out again, feeling sure that his transactions with Mr. Neeft would form the subject of conversation in the club billiard-room for the next hour and a half. It would certainly become expedient that he should travel abroad.

He felt it to be quite a relief when he found that Mr. Neeft was not waiting for him at his chambers. “Adolphe,” he said, as soon as he was dressed, “that man must never be allowed to put his foot inside the door again.”

“Ah—the Apollo gone! And he did it express!”

“I don’t mind the figure—but he must never be allowed to enter the place again. I shall not stay up long, but while we are here you must not leave the place till six. He won’t come in the evening.” Then he put a sovereign into the man’s hand, and went out to dine at Lady Eardham’s.

Lady Eardham had three fair daughters, with pretty necks, and flaxen hair, and blue eyes, and pug noses, all wonderfully alike. They ranged from twenty-seven to twenty-one, there being sons between—and it began to be desirable that they should be married. Since Ralph had been in town the Eardham mansion in Cavendish Square had been opened to him with almost maternal kindness. He had accepted the kindness; but being fully alive to the purposes of matronly intrigue, had had his little jokes in reference to the young ladies. He liked young ladies generally, but was well aware that a young man is not obliged to offer his hand and heart to every girl that is civil to him. He and the Eardham girls had been exceedingly intimate, but he had had no idea whatever of sharing Newton

Priory with an Eardham. Now, however, in his misery, he was glad to go to a house in which he would be received with an assured welcome.

Everybody smiled upon him. Sir George in these days was very cordial, greeting him with that genial esoteric warmth which is always felt by one English country gentleman with a large estate for another equally blessed. Six months ago, when it was believed that Ralph had sold his inheritance to his uncle, Sir George when he met the young man addressed him in a very different fashion. As he entered the room he felt the warmth of the welcoming. The girls, one and all, had ever so many things to say to him. They all hunted, and they all wanted him to look at horses for them. Lady Eardham was more matronly than ever, and at the same time was a little fussy. She would not leave him among the girls, and at last succeeded in getting him off into a corner of the back drawing-room.

“Now, Mr. Newton,” she said, “I am going to show you that I put the greatest confidence in you.”

“So you may,” said Ralph, wondering whether one of the girls was to be offered to him, out of hand. At the present moment he was so low in spirits that he would probably have taken either.

“I have had a letter,” said Lady Eardham, whispering the words into his ear—and then she paused. “Such a strange letter, and very abominable. I’ve shown it to no one—not even to Sir George. I wouldn’t let one of the girls see it for ever so much.” Then there was another pause. “I don’t believe a word of it, Mr. Newton; but I think it right to show it to you—because it’s about you.”

“About me?” said Ralph, with his mind fixed at once upon Mr. Neeft.

“Yes, indeed—and when I tell you it refers to my girls too, you will see how strong is my confidence in you. If either had been specially named, of course I could not have shown it.”

Then she handed him the letter, which poor Ralph read, as follows:

“MY LADY: I’m told as Mr. Ralph Newton, of Newton Priory, is sweet upon one of your ladyship’s daughters. I think it my duty to tell your ladyship he’s engaged to marry my girl, Maryanne Neeft.

“Yours most respectful,

“THOMAS NEEFIT,

“Breeches-maker, Conduit Street.”

“It’s a lie,” said Ralph.

“I’m sure it’s a lie,” said Lady Eardham, “only I thought it right to show it you.”

Ralph took Gus Eardham down to dinner, and did his very best to make himself agreeable. Gus was the middle one of the three, and was certainly a fine girl. The Eardham girls would have no money; but Ralph was not a greedy man—except when he was in great need. It must be supposed, however, that on this occasion he made up his mind to marry Gus Eardham. But, as on previous occasions, he had been able to hold all the Eardhams in a kind of subjection to himself, feeling himself to be bigger than they—as hitherto he had been conscious that he was bestowing and they receiving—so now, in his present misfortune, did he recognize that Gus was a little bigger than himself, and that it was for her to give and for him to take. And Gus was able to talk to him as though she also entertained the same conviction. Gus was very kind to him, and he felt grateful to her.

Lady Eardham saw Gus alone in her bedroom that night. “I believe he’s a very good young man,” said Lady Eardham, “if he’s managed rightly. And as for all this about the horrid man’s daughter, it don’t matter at all. He’d live it down in a month if he were married.”

“I don’t think any thing about that, mamma. I dare say he’s had his fun—just like other men.”

“Only, my dear, he’s one of that sort that have to be fixed.”

“It’s so hard to fix them, mamma.”

“It needn’t be hard to fix him—that is, if you’ll only be steady. He’s not sharp and hard and callous, like some of them. He doesn’t mean any harm, and if he once speaks out, he isn’t one that can’t be kept to time. His manners are nice. I don’t think the property is involved; but I’ll find out from papa; and he’s just the man to think his wife the pink of perfection.” Lady Eardham had read our hero’s character not inaccurately.

CHAPTER LIII.

THE END OF POLLY NEEFIT.

RUMORS, well-supported rumors, as to the kind of life which Mr. Neeft was leading, reached Alexandria Cottage, filling Mrs. Neeft’s mind with dismay, and making Polly

very angry indeed. He came home always somewhat the worse for drink, and would talk of punching the heads both of Mr. Newton and of Mr. Ontario Moggs. Waddle, who was very true to his master's interests, had taken an opportunity of seeing Mrs. Neeft, and of expressing a very distinct idea that the business was going to the mischief. Mrs. Neeft was of opinion that in this emergency the business should be sold, and that they might safely remove themselves to some distant country—to Tunbridge, or perhaps to Ware. Polly, however, would not accede to her mother's views. The evil must, she thought, be cured at once. "If father goes on like this, I shall just walk straight out of the house, and marry Moggs at once," Polly said. "Father makes no account of my name, and so I must look out for myself." She had not as yet communicated these intentions to Ontario, but she was quite sure that she would be supported in her views by him whenever she should choose to do so.

Once or twice Ontario came down to the cottage, and when he did so, Mr. Neeft was always told of the visit. "I ain't going to keep any thing from father, mother," Polly would say. "If he chooses to misbehave, that isn't my fault. I mean to have Mr. Moggs, and it's only natural I should like to see him."

Neeft, when informed of these visits, after swearing that Moggs junior was a sneaking scoundrel to come to his house in his absence, would call upon Moggs senior, and swear with many threats that his daughter should have nothing but what she stood up in. Moggs senior would stand quite silent, cutting the skin on his hand with his shoemaker's knife, and would simply bid the infuriated breeches-maker good-morning, when he left the shop. But, in truth, Mr. Moggs senior had begun to doubt. "I'd leave it a while, Onty, if I was you," he said. "May be, after all, he'll give her nothing."

"I'll take her the first day she'll come to me—money or no money," said Moggs junior.

Foiled ambition had, in truth, driven the breeches-maker to madness. But there were moments in which he was softened, melancholy, and almost penitent. "Why didn't you have him when he come down to Margate?" he said, with the tears running down his cheeks, that very evening after eating his rump-steak in Mr. Newton's rooms. The soda-water and brandy, with a little gin-and-water after it, had reduced him to an almost maudlin condition, so that he was unable to support his parental authority.

"Because I didn't choose, father. It wasn't his fault. He spoke fair enough—though I don't suppose he ever wanted it. Why should he?"

"You might have had him then. He'd 've never dared to go back. I'd a killed him if he had."

"What good would it have done, father? He'd never have loved me, and he'd have despised you and mother."

"I wouldn't 've minded that," said Mr. Neeft, wiping his eyes.

"But I should have minded. What should I have felt with a husband as wouldn't have wanted me ever to have my own father in his house? Would that have made me happy?"

"It 'd 've made me happy to know as you was there."

"No, father; there would have been no happiness in it. When I came to see what he was I knew I should never love him. He was just willing to take me because of his word—and was I going to a man like that? No, father—certainly not." The poor man was at that moment too far gone in his misery to argue the matter further, and he lay on the old sofa, very much at Polly's mercy. "Drop it, father," she said. "It wasn't to be, and it couldn't have been. You'd better say you'll drop it." But, sick and uncomfortable as he was on that evening, he couldn't be got to say that he would drop it.

Nor could he be got to drop it for some ten days after that—but on a certain evening he had come home very uncomfortable from the effects of gin-and-water, and had been spoken to very sensibly both by his wife and daughter.

By seven on the following morning Ontario Moggs was sitting in the front parlor of the house at Hendon, and Polly Neeft was sitting with him. He had never been there at so early an hour before, and it was thought afterward by both Mr. and Mrs. Neeft that his appearance, so unexpected by them, had not surprised their daughter Polly. Could it have been possible that she had sent a message to him after that little scene with her father? There he was, at any rate, and Polly was up to receive him. "Now, Onty, that'll do. I didn't want to talk nonsense, but just to settle something."

"But you'll tell a fellow that you're glad to see him?"

"No I won't. I won't tell a fellow any thing he doesn't know already. You and I have got to get married."

"Of course we have."

"But we want father's consent. I'm not going to have him made unhappy, if I can help it. He's that wretched sometimes at present that my heart is half killed about him."

"The things he says are monstrous," asserted Moggs, thinking of the protestation lately made by the breeches-maker in his own hearing, to the effect that Ralph Newton should yet be made to marry his daughter.

"All the same I've got to think about him. There's a dozen or so of men as would marry me, Mr. Moggs; but I can never have another father."

"I'll be the first of the dozen any way," said the gallant Ontario.

"That depends. However, mother says so, and if father'll consent, I won't go against it. I'll go to him now, before he's up, and I'll tell him you're here. I'll bring him to his senses if I can. I don't know

whatever made him think so much about gentlemen."

"He didn't learn it from you, Polly."

"Perhaps he did, after all; and if so, that's the more reason why I'd forgive him."

So saying, Polly went up-stairs upon her mission. On the landing she met her mother, and made known the fact that Ontario was in the parlor. "Don't you go to him, mother—not yet," said Polly. Whereby it may be presumed that Mrs. Neeft had been informed of Mr. Moggs's visit before Polly had gone to him.

Mr. Neeft was in bed, and his condition apparently was not a happy one. He was lying with his head between his hands, and was groaning, not loudly, but very bitterly. His mode of life for the last month had not been of a kind to make him comfortable, and his conscience, too, was ill at ease. He had been a hard-working man, who had loved respectability and been careful of his wife and child. He had been proud to think that nobody could say any thing against him, and that he had always paid his way. Up to the time of this disastrous fit of ambition on Polly's behalf, he had never made himself ridiculous, and had been a prosperous tradesman, well thought of by his customers. Suddenly he had become mad, but not so mad as to be unconscious of his own madness. The failure of his hopes, joined to the inexpressibly bitter feeling that in their joint transactions young Newton had received all that had been necessary to him, whereas he, Neeft, had got none of that for which he had bargained—these together had so upset him that he had lost his balance, had travelled out of his usual grooves, and had made an ass of himself. He knew he had made an ass of himself—and was hopelessly endeavoring to show himself to be less of an ass than people thought him, by some success in his violence. If he could only punish young Newton terribly, people would understand why he had done all this. But drink had been necessary to give him courage for his violence, and now as he lay miserable in bed, his courage was very low.

"Father," said Polly, "shall I give you a drink?"

Neeft muttered something, and took the cold tea that was offered to him. It was cold tea, with just a spoonful of brandy in it to make it acceptable.

"Father, there ought to be an end of all this—oughtn't there?"

"I don't know about no ends. I'll be down on him yet."

"No you won't, father. And why should you? He has done nothing wrong to you or me. I wouldn't have him if it was ever so."

"It's all been your fault, Polly."

"Yes—my fault; that I wouldn't be made what you call a lady; to be taken away, so that I'd never see any more of you and mother!" Then she put her hand gently on his shoulder. I couldn't stand that, father."

"I'd make him let you come to us."

"A wife must obey her husband, father. Mother always obeyed you."

"No, she didn't. She's again me now."

"Besides, I don't want to be a lady," said Polly, seeing that she had better leave that question of marital obedience; "and I won't be a lady. I won't be better than you and mother."

"You've been brought up better."

"I'll show my breeding, then, by being true to you, and true to the man I love. What would you think of your girl, if she was to give her hand to a—gentleman, when she'd given her heart to a—shoemaker?"

"Oh, d— the shoemaker!"

"No, father, I won't have it. What is there against Ontario? He's a fine-hearted fellow, as isn't greedy after money—as 'd kiss the very ground I stand on he's that true to me, and is a tradesman as yourself. If we had a little place of our own, wouldn't Ontario be proud to have you there, and give you the best of every thing; and wouldn't I wait upon you, just only trying to know beforehand every tittle as you'd like to have? And if there was to be babies, wouldn't they be brought up to love you? If I'd gone with that young man down to his fine place, do you think it would have been like that? How 'd I've felt when he was too proud to let his boy know as you was my father?"

Neeft turned on his bed and groaned. He was too ill at ease as to his inner man to argue the subject from a high point of view, or to assert that he was content to be abased himself in order that his child and grandchildren might be raised in the world.

"Father," said Polly, "you have always been kind to me. Be kind to me now."

"The young 'uns is always to have their own way," said Neeft.

"Hasn't my way been your way, father?"

"Not when you wouldn't take the captain when he come to Margate."

"I didn't love him, father. Dear father, say the word. We haven't been happy lately—have we, father?"

"I ain't been very 'appy," said Neeft, bursting out into sobs.

She put her face upon his brow and kissed it. "Father, let us be happy again. Ontario is down-stairs—in the parlor now."

"Ontario Moggs in my parlor!" said Neeft, jumping up in bed.

"Yes, father; Ontario Moggs—my husband, as will be; the man I honor and love; the man that will honor and love you; as true a fellow as ever made a young woman happy by taking her. Let me tell him that you will have him for a son." In truth, Neeft did not speak the word—but when Polly left the room, which she presently did after a long embrace, Mr. Neeft was aware that his consent to the union would be conveyed to Ontario Moggs in less than five minutes.

"And now you can name the day," said Ontario.

"I cannot do any such thing," replied Polly; "and I think that quite enough has been settled for one morning. It's give an inch and take an ell with some folks."

Ontario waited for breakfast, and had an interview with his future father-in-law. It

was an hour after the scene up-stairs before Mr. Neeft could descend, and, when he did come down, he was not very jovial at the breakfast-table. "It isn't what I like, Moggs," was the first word that he spoke when the young politician rose to grasp the hand of his future father-in-law.

"I hope you'll live to like it, Mr. Neeft," said Ontario, who, now that he was to have his way in regard to Polly, was prepared to disregard entirely any minor annoyances.

"I don't know how that may be. I think my girl might have done better. I told her so, and I just tell you the same. She might a' done a deal better, but women is always restive."

"We like to have our own way about our young men, father," said Polly, who was standing behind her father's chair.

"Bother young men!" said the breeches-maker. After that the interview passed off, if not very pleasantly, at least smoothly—and it was understood that Mr. Neeft was to abandon that system of persecution against Ralph Newton to which his life had been devoted for the last few weeks.

After that there was a pretty little correspondence between Polly and Ralph, with which the story of Polly's maiden life may be presumed to be ended, and which shall be given to the reader, although by doing so the facts of our tale will be somewhat anticipated. Polly, with her father's permission, communicated the fact of her engagement to her former lover

"HENDON, Saturday.

"DEAR SIR: Father thinks it best that I should tell you that I am engaged to marry Mr. Ontario Moggs—whom you will remember. He is a most respectable tradesman, and stood once for a member of Parliament, and I think he will make me quite happy; and I'm quite sure that's what I'm fitted for." Whether Polly meant that she was fittest to be made happy, or fitted to be the wife of a tradesman who stood for Parliament, did not appear quite clearly.

"There have been things which we are very sorry for, and hope you'll forgive and forget. Father bids me to say how sorry he is he broke a figure of a pretty little man in your room. He would get another, only he would not know where to go for it.

"Wishing you always may be happy, believe me to remain,

"Yours most respectfully,

"MARY ANNE NEEFIT."

Ralph's answer was dated about a fortnight afterward.

"—, CAVENDISH SQUARE, June 1, 186—.

"MY DEAR POLLY: I hope you will allow me to call you so now for the last time. I am, indeed, happy that you are going to be married. I believe Mr. Moggs to be a most excellent fellow. I hope I may often see him—and sometimes you. He must allow you to accept a little present which I send you, and never be jealous if you wear it at your waist.

"The pretty little man that your father

broke by accident in my rooms did not signify at all. Pray tell him so from me.

"Believe me to be

"Your very sincere friend,

"RALPH NEWTON."

"I may as well tell you my own secret. I am going to be married, too. The young lady lives in this house, and her name is Augusta Eardham."

This letter was sent by messenger from Cavendish Square, with a very handsome watch and chain. A month afterward, when he was preparing to leave London for Bray-boro' Park, he received a little packet, with a note as follows:

"LINTON, DEVONSHIRE, Wednesday.

"DEAR MR. NEWTON: I am so much obliged for the watch, and so is Ontario, who will never be jealous, I'm sure. It is a most beautiful thing, and I shall value it, oh! so much. I am very glad you are going to be married, and should have answered before, only I wanted to finish making with my own hand a little chain which I send you. And I hope your sweetheart won't be jealous, either. We looked her out in a book, and found she is the daughter of a great gentleman with a title. That is all just as it should be. Ontario sends his respects. We have come down here for the honeymoon.

"I remain, yours very sincerely,

"MARY ANNE MOGGS."

CHAPTER LIV.

MY MARY.

BOTH the invitations sent by Patience Underwood were accepted, and Sir Thomas, on the day named, was at home to receive them. Nothing had as yet been done as to the constructing of those cases which he so suddenly ordered to be made for his books; and, indeed, Stemm had resolved to take the order as meaning nothing. It would not be for him to accelerate his master's departure from Southampton Buildings, and he knew enough of the man to be aware that he must have some very strong motive indeed before so great a change could be really made. When Sir Thomas left Southampton Buildings for Fulham, on the day named for the dinner, not a word further had been said about packing the books.

There was no company at the villa besides Sir Thomas, the three girls, and the two young men. As to Clarissa, Patience said not a word, even to her father—that must still be left till time should further cure the wound that had been made—but she did venture to suggest, in private with Sir Thomas, that it was a pity that he who was certainly the more worthy of the two Ralphs should not be made to understand that others did not think so much of the present inferiority of his position in the world as he seemed to think himself.

"You mean that Mary would take him?" asked Sir Thomas.

"Why should she not, if she likes him? He is very good."

"I can't tell him to offer to her, without telling him also that he would be accepted."

"No—I suppose not," said Patience.

Nevertheless, Sir Thomas did speak to Ralph Newton before dinner—stuttering and muttering, and only half-finishing his sentence. "We had a correspondence once, Mr. Newton. I dare say you remember."

"I remember it very well, Sir Thomas."

"I only wanted to tell you—you seem to think more about what has taken place—I mean as to the property—than we do—that is, than I do."

"It has made a change."

"Yes; of course. But I don't know that a large place like Newton is sure to make a man happy. Perhaps you'd like to wash your hands before dinner." Gregory, in the meantime was walking round the garden with Mary and Clarissa.

The dinner was very quiet, but pleasant and cheerful. Sir Thomas talked a good deal, and so did Patience. Mary also was at her ease, and able to do all that was required of her. Ralph certainly was not gay. He was seated next to Clarissa, and spoke a few words now and again; but he was arranging matters in his mind; and Patience, who was observing them all, knew that he was preoccupied. Clarissa, who now and again would forget her sorrow and revert to her former self—as she had done in the picture-gallery—could not now, under the eye as it were of her father, her sister, and her old lover, forget her troubles. She knew what was expected of her; but she could not do it—she could not do it at least as yet. Nevertheless, Patience, who was the engineer in the present crisis, was upon the whole contented with the way in which things were going.

The three girls sat with the gentlemen for a quarter of an hour after the decanters were put upon the table, and then withdrew. Sir Thomas immediately began to talk about Newton Priory, and to ask questions which might interest the parson, without, as he thought, hurting the feelings of the disinherited Ralph. This went on for about five minutes, during which Gregory was very eloquent about his church and his people, when, suddenly, Ralph rose from his chair and withdrew. "Have I said any thing that annoyed him?" asked Sir Thomas, anxiously.

"Is it not that, I think," said Gregory.

Ralph walked across the passage, opened the door of the drawing-room, in which the three girls were at work, walked up to the chair in which Mary Bonner was sitting, and said something in so low a voice that neither of the sisters heard him.

"Certainly I will," said Mary, rising from her chair. Patience glanced round, and could see that the color, always present in her cousin's face, was heightened—ever so little indeed; but still the tell-tale blush had told its tale. Ralph stood for a moment while Mary moved away to the door, and then followed her without speaking a word

to the other girls, or bestowing a glance on either of them.

"He is going to propose to her," said Clarissa, as soon as the door was shut.

"No one can be sure," said Patience.

"Only fancy—asking a girl to go out of the room—in that brave manner! I shouldn't have gone, because I'm a coward; but it's just what Mary will like."

"Let me get my hat, Mr. Newton," said Mary, taking the opportunity to trip upstairs, though her hat was hanging in the hall. When she was in her room she merely stood upright there, for half a minute, in the middle of the chamber, erect and stiff, with her arms and fingers stretched out, thinking how she would behave herself. Half a minute sufficed for her to find her clew, and then she came down as quickly as her feet would carry her. He had opened the front door, and was standing outside upon the gravel, and there she joined him.

"I had no other way but this of speaking to you," he said.

"I don't dislike coming out at all," she answered. Then there was silence for a moment or two as they walked along into the gloom of the shrubbery. "I suppose you are going down to Norfolk soon?" she said.

"I do not quite know. I thought of going to-morrow."

"So soon as that?"

"But I've got something I want to settle. I think you must know what it is." Then he paused again, almost as though he expected her to confess that she did know. But Mary was well aware that it was not for her to say another word till he had fully explained in most open detail what it was that he desired to settle. "You know a good deal of my history, Miss Bonner. When I thought that things were going well with me—much better than I had ever allowed myself to expect in early days, I—I—became acquainted with you." Again he paused, but she had not a word to say. "I dare say you were not told, but I wrote to your uncle then, asking him whether I might have his consent to—just to ask you to be my wife." Again he paused, but after that he hurried on, speaking the words as quickly as he could throw them forth from his mouth. "My father died, and of course that changed every thing. I told your uncle that all ground for pretension that I might have had before was cut from under me. He knew the circumstances of my birth—and I supposed that you would know it also."

Then she did speak. "Yes, I did," she said.

"Perhaps I was foolish to think that the property would make a difference. But the truth of it is, I have not got over the feeling, and shall never get over it. I love you with all my heart—and, though it be for no good, I must tell you so."

"The property can make no difference," she said. "You ought to have known that, Mr. Newton."

"Ah—but it does. I tried to tell you the other day something of my present home."

"Yes—I know you did—and I remember it all."

"There is nothing more to be said—only to ask you to share it with me."

She walked on with him in silence for a minute; but he said nothing more to press his suit, and certainly it was her turn to speak now. "I will share it with you," she said, pressing her arm upon his.

"My Mary!"

"Yes—your Mary—if you please." Then he took her in his arms, and pressed her to his bosom, and kissed her lips and forehead, and threw back her hat, and put his fingers among her hair. "Why did you say that the property would make a difference?" she asked, in a whisper. To this he made no answer, but walked on silently, with his arm round her waist, till they came out from among the trees, and stood upon the bank of the river. "There are people in the boats. You must put your arm down," she said.

"I wonder how you will like to be a farmer's wife?" he asked.

"I have not an idea."

"I fear so much that you'll find it rough and hard."

"But I have an idea about something." She took his hand, and looked up into his face, as she continued. "I have an idea that I shall like to be your wife." He was in a seventh heaven of happiness, and would have stood there gazing on the river with her all night, if she would have allowed him. At last they walked back into the house together—and into the room where the others were assembled, with very little outward show of embarrassment. Mary was the first to enter the room, and though she blushed she smiled also, and every one knew what had taken place. There was no secret or mystery, and in five minutes her cousins were congratulating her.

"It's all settled for you now," said Clarissa, laughing.

"Yes, it's all settled for me now, and I wouldn't have it unsettled for all the world."

While this was being said in the drawing-room—being said even in the presence of poor Gregory, who could not but have felt how hard it was for him to behold such bliss, Sir Thomas and Ralph had withdrawn into the opposite room. Ralph began to apologize for his own misfortunes—his misfortune in having lost the inheritance, his misfortune in being illegitimate; but Sir Thomas soon cut his apologies short. "You think a great deal more of it than she does, or than I do," said Sir Thomas.

"If she does not regard it, I will never think of it again," said Ralph. "My greatest glory in what had been promised me was in thinking that it might help to win her."

"You have won her without such help as that," said Sir Thomas, with his arm on the young man's shoulder.

There was another delicious hour in store for him as they sat over their late tea. "Do you still think of going to Norfolk to-morrow?" she said to him, with that composure which in her was so beautiful, and, at the same time, so expressive.

"By an early train in the morning."

"I thought that perhaps you might have stayed another day now."

"I thought that perhaps you might want me to come back again," said Ralph—"and, if so, I could make arrangements—perhaps for a week or ten days."

"Do come back," she said. "And do stay."

Ralph's triumph as he returned that evening to London received Gregory's fullest sympathy; but still it must have been hard to bear. Perhaps his cousin's parting words contained for him some comfort. "Give her a little time, and she will be yours yet. I shall find it all out from Mary, and you may be sure we shall help you."

[TO BE CONTINUED.]

APPLETONS' JOURNAL

OF LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 112.—VOL. V.]

SATURDAY, MAY 20, 1871.

[PRICE TEN CENTS.]

A STRANGE BORDER.

IT is the melancholy fate of most cities to be befringed by impurities and disagreeables of one character or another; to fray out into barely habitable dinginess in the matter of dwellings and door-yards; to melt away by slow degrees into noisy regions of machinists'

iron paths emerging from banks of green, miles away, glistening and intermingling as they come; into dripping docks redolent of scourings and opaque fluctuating washings; into various landings rich in new associations, and new beginnings reflected upon by heavy-eyed, grate-

A SCENE IN THE OUTSKIRTS OF NEW YORK.

shops, where grime and smoke abound; into wide, salty marshes, cropped and uncropped, ditched and staked; into dreary tracts of gravelly barrenness, diffuse of quivering heats or blinding with pathless snows; into tumultuous river-sides with adjacent towering, unclean hives for the wretches of the quarter; into low burrowings for the villains and debauchees of everywhere; into focuses of straggling

ful foreigners; into a general indefiniteness, an uncomfortable, unrefreshing state of beginning and ending; into a seeming hopeless inability to be any thing but an incorrigible, tiresome waste.

All assemblages of human habitations thus wear their skirts, from hamlets of six houses to the Londons of as many hundred thousands. They all sweep outward much to the same purpose,

varying only perhaps in the build of structures or the dress and volubility of the inevitable haunting dust-assorters. But our country affords at least one great sample of a new element in the power of disorder without being barren of all the rest of the catalogue. What we allude to is the singular character of the northern outlying portions of the city of New York. It is a broken, unkempt, dismantled area, upon which habitations appear to have been showered by an untasteful architectural pepper-box. It is a place of rocky asperities and high, hard, barren, stony outcroppings, bursting out upon every hand and at every distance, as if the great city below had, by its weight, in some manner gradually pressed the substance of the soil to the surface as it advanced. Its principal power seems to be the generation of fierce heats, which are gathered up by the full breezes from the lower grounds and are blown at the multitudinous settlers of the vast region, scorching and embrowning them.

It is everywhere; it obstinately and suddenly chokes off streets while in full burst for somewhere, while others it strangles at their conceptions, and derisively bears upon its silicious, glittering front, their numbers, much as if some thoroughfare was there buried forever, and the cliff was its respectful, sorrowful monument, while, in reality, it is but its hypocritical stiffer.

It is forever being hacked at—shivered by blasts, pried and battered by blows. There are numerous excavations constantly going on, where bony horses, racked and awkward carts, load themselves with some trivial fragments, and jolt off, and some venturer's cellar is thus picked out piecemeal. Lofty derricks with huge swinging arms spring out of it at all points; streets which have persevered and conquered in their efforts to get through it, transform themselves into damp causeways, with jagged, gloomy sides. Its flinty hardness breaks out from under some inches of deceptive soil, and checks and balks the improvers in matters of water, gas, and pavements, with an exasperating and costly frequency. It is the mortal enemy to grades and levels, and therefore, to the end of reducing it, you find many groups of men perched in its crevices, upon its inclined shelves, and upon its bald, hot surfaces, forever raining lazy, rhythmic blows upon iron drills perpetually turned by other seated men, dressed in dusty blue with slouched hats, and who seem to be lulled into deep apathy by the regular muffled ring of the blows showered about them.

In some mysterious fashion soil has drifted into the many depressions in the wide acres of sterility, lying slightly in most places, but deeply in a few, very much as a winter's snow sweeps over the place and sinks into the same depressions. Wide, dusty avenues strike boldly off northward, disappearing suddenly at the tops of long hills, up which there run railways, glistening and narrowing as they climb. Abortive structures show themselves in the wretched region; such as sewer-mouths, piles of masonry through which water may run at some time or another, but which with many stacks of yawning, black pipes, and rusty, continuous lines of other pipes, stand up out of the surrounding soil as if some great tide had suddenly swept down, and, bearing away all but heavy matter, left them forlorn, dry, and useless. Every thing appears to begin in dust. Long lines of tottering plants and weeds, endless wall-barriers, gaunt telegraph-poles; some sickly, leafless, stunted trees project feebly upward, carrying upon them a whitish pall of the same dust, and appear to be well advanced in the process of crumbling, and of resolving themselves back to earth again, and also seem disgusted at ever having started from it.

By the road-sides, and also rising directly from the dust, and also carrying mounds and drifts of it upon every trifling projection, as well as every great one, you have some whitish decrepit two-storied inns, tottering all awry, out of shape and coherence, as if some earthquake had tossed them for miles, and finally allowed them to settle, bottom up. You find wretched bars by crossing cracked floors; some soiled, cackling geese stalking after some incessantly-screaming children; a veil of the inevitable dust thinly spread everywhere; a scant row of poisonous bottles, a perspective of mildewed walls, and a general atmosphere of rankness and unclean habit. The rears of these dismal structures sink away into muddy pools; distorted windows, which open upon bad air, look upon distorted and surprising landscapes; rusty iron funnels break out at all corners; and useless gutters, long since innocent of conveying water, hang broken and swinging from impossible eaves.

They have dangerous parodies upon porticos where tilting boards make footholds unsafe; and staggering pillars support dismantled roofs which are equally threatening. Whittled and well-worn seats

abound, occupied mostly by men and boys of two foul garments each, who stare and mumble, and who only speak to curse, even among themselves. In the winter it is fearful, in the summer it is horrible. Back of these rows of buildings, which confront the avenues, with rough signs giving out the fact of their publicity in uncouth flaring letters, dusty, like all else, there lives a strange people, dwellers in the pepper-boxed habitations before mentioned. They are the fag-ends of society, and live upon nothing, but are useful and amount to much. River-sailors, bargemen, day-laborers, cartmen, *chiffonniers*, dust-gatherers, licensed vendors, and the nameless throng of wretches who live by inexplicable means, descend upon open spaces, wherever found, and violently build their houses in a night, in the midst of the clamors of those who have preceded them to neighboring sites.

Decently-clad men of the city streets turn up here; those neatly-dressed, powerful women, with Indian-like faces and shrill voices, who are merchants of berries and fruits, are here the landed proprietors of many yards and sentry-box mansions. The daily recurring six o'clock p. m. witnesses a strange and hungry absorption of motley crowds, who plunge from organized streets and totally disappear. Factory-girls, proud of the ribbons of a month's savings; distillery and mill hands with gleaming pails; wearied teams owned by contractors in the fetching and carrying of dirt, more or less of which still soils them; pick-men and shovellers with their implements and outer jackets upon their arms, and who unconsciously work into a swaying file as they rapidly stride onward; begrimed boys, proud of a day's labor done, and which pride shows out in their glances; swarthy women with knotted bundles upon their erect heads, and whimpering children at their skirts; wearied *gamins*, who thus acknowledge the only law they know, that of satisfying hunger; and artful, uncouth beggars, of both sexes, habited in rags, and, by custom, in doleful countenances—all flow into this intricate region a great deal as if some Pied Piper of Hamelin were perched upon the high rocks, piping the same old mysterious seductive tune which drew the happy children from everywhere, or, as if the place were a huge sponge, sopping up unclean currents of humanity for the sake of the purity of all the rest.

It is as intricate as the Maze at Woodstock. Lanes set out, as did certain railways at Mugby Junction, with the brave intention of going somewhere, but only to bring up with ignominious shortness. Alleys stretch away for forty feet, and are then blocked by a dog-kennel, the abode of a family. Paths are tramped out over arid rocks and through knee-high weeds, with bridges of unsafe planks spanning greenish and purplish streams. Splinters of rock catch currents of sewerage, and some beautiful green leaves spring from out the foulness. All is confused, haphazard, and unintelligible. Ten seconds in one direction will balk you to the right, where ten more seconds will carry you through a domicile and over a precipice. Whitish houses, seven feet high, are the common staple, and each one is planted with an extravagant disregard of the position of the others. There is presented a wilderness of rough corners badly fitted and trimmed; bewildering half-views, with proportion and perspective gone mad; full-front-views, with gaping leather-hinged doors and glassless sashes which hang and tremble loosely, quite ready to drop altogether. The buildings back up upon one another in close contact, as if room were scarce; and then others, inconsistently with this idea, stand alone with tottering independence in a handful of sandy gravel, or upon bulging rocks. They are fixed upon steep descents, clinging to precarious shelves, apparently in great danger of slipping, or planted in miniature valleys where there is as much danger of being fallen upon. In the insufferable heat they seemingly shrink and crack, and to emerge from the clouds of dust which sweep down upon them in a weakened condition. Seen from anywhere, the prospect is most forlorn and comfortless. Nothing stands of itself, but all is braced, supported, wedged, and withed. Nothing is whole, but all is patched, mended, or wanting patching and mending. Nothing is new, but all is old, decayed, foreign to its present use, sadly out of place, and dispiriting in its raggedness and unfitness. Roofs are made of three times the necessary thickness by a continuous piling on of planks, stones, and of any thing which has a surface. Walls with no foundations slip and stagger under the heaps of strengthening ignorantly put upon them, and which makes them precarious and good for nothing. These strange habitations are multitudinous. Built of rubbish individually, they hold a rubbishy appearance collectively. Seeing them from above, below, and from all sides, and in all weathers, you have a spectacle of ideal misery.

But, as misery is only misery when felt by the miserable, and not as it is understood by the comfortable, this strange, gypsy-like, uncitizenized herd of some thousands, show none of it upon examination. They are simply a mass of stragglers, totally without vanity.

Pity and commiseration would be thrown back upon your hands. Their original capital is abject poverty, a lack of pride, and, in some cases, an ignorance of our language. With this stock in trade they begin life, and live it with a remarkable degree of comfort, as they understand comfort. Begging, a little shrewd stealing, and the gathering, separating, and reselling of refuse, require no money, and they trade in second-handed necessities among themselves.

There are many rumors of fierce feuds and *vendettas* among the dwellers in the place, arising out of disputed rights. Long and undisturbed occupancy of a certain spot, gives a supposed hold upon a certain view, a certain amount of air and light; and a hard way is his whose fancy inclines him to interrupt any of these privileges by erecting his own fig-tree. Certain it is that long tales are told of valorous demolitions, by the termagants of the intruded spots, who, in their turns, tell of fierce battles fought to establish their own now acknowledged claims.

Strange little gardens crop out into a dusty luxuriance of kitchen-stuff, intermingled with some tall-stalked, flaring flowers, and are laid out with an irregularity which is wonderful to observe. The fences which enclose them are marvels of ingenuity in composition; all kinds of refuse which will cover a hand's breadth going to make them up; and especially remarkable in point of obstruction to marauding geese is the fence of one Chôisé, an industrious *chiffonnier*, and a large capitalist in his way, and also a man of incorrigible hatred to intruders. Having this last peculiarity in a great degree, he has surrounded his little fortress, of two scant rooms and a beggarly stoop, with a remarkable wall. In it, interwoven among laths and upright splinters of wood driven into the ground, are fork-tines, scythe-edges, table-knife blades, sharp scraps of tin, pot-covers, coverless umbrellas, long hooks ingeniously fabricated of wire, many bent, unserviceable nails, and all metals which could in any manner inflict an injury upon an invader, and which the proprietor has selected in the course of four years of wandering. He is a man of establishment. On your approach to his fearful gate, you come upon a hand-cart duly labelled with his license, and properly road-stained, as any well-worked cart should be. Three dogs howl dismally as you apply at a fortified gate, and stand erect upon their gaunt legs, ready to fly at one with great ferocity. Their racket brings to view Chôisé's burly madame, who scowls by way of habit, but whose hard looks disappear at the sight of visitors, who are very welcome.

The dwarfed, uncouth dwelling, is an excellent example of all the rest which lie around it. It is built of odds and ends, and appears highly infirm and unsafe, and as though a moderate push would demolish it, and cause it to fly away in a cloud of splinters.

First comes a garden, as large as the top of an omnibus, and about as fertile. Some twenty pale cabbages languish among as many bowlders; and a few potato-hills, parched out of all promise of yield, lie brown and sproutless, gravely mausoleums of agricultural hopes. Some sunflowers, however, boldly raise their flaming heads, but nothing else masters the sterility. Three hogsheads, tilted upon their sides, serve for kennels for the three black dogs, whose harnesses encumber the little porch. Inside, Chôisé himself is to be found—a tall, attenuated, hairy-breasted, bright-eyed man of fifty, with stooping shoulders and slow utterance. He shakes hands as if he were clutching a valuable atom of coal which proved to have just come from the grate. He shows off his house and its belongings with much pride, and protests that he is happy, and doing very well in spite of the summer.

His main room contains a huge, brass-mounted, foreign-looking chest of drawers, an immovable bedstead beside a small window, whose sill holds a box of yellowish-speckled geraniums, a dining-table of small size covered with an enamelled cloth, and some chairs. About the walls is a print of the Crucifixion, some brightly-burnished pans, one or two porcelain pipes of enormous depths, with faded tassels, and some odd knick-knacks upon shelves.

Here is comfort. Every thing scrupulously neat, the bed-linen very white, the articles all in their respective places, and there is a general effect of decency, not to say taste. The other apartment is hung with sieves, rough, home-made affairs, patched with leather strips, and ingeniously kept whole by thongs, thus illustrating a sharp

economy. Sundry barrels crowd the way, and there is pendent from the ceiling a thick fringe of articles of prospective value, all of which have been scrupulously collected, and thus disposed like rusty ragged stalactites. There is an odd collection—some fire-burnt grates, handleless fire-shovels, chipped flat-irons, wooden rolling-pins, bunches of thick-necked bottles, resembling enormous grapes, cracked stove-castings, with numberless festoons of rope in various stages of uselessness and decay. At all these Chôisé looks admiringly, and fondly rings them with his professional poker with its curved end, which he always carries in his hand, as if to be ever ready to fall upon an accidental dust-heap and drag it to pieces.

There is an all-pervading smell of mustiness, as if the air were filled with carpet-fibre, or particles of decaying cordage, and a damp tumbled bed in one corner, looking miserably uninviting. Chôisé hints that it belongs to the boys, and instantly calls them, in a high key. Upon this, two young beings emerge from the gloom, caused by some barrels, holding in their hands the remains of a bread-and-butter breakfast.

"Look at 'em," cried Chôisé, "alwis munchin an grubbin, alwis stuffin' of themselves." Here the boys look reproachfully at each other, as if demanding what they meant by it. "I never see two such vultures, never. You can't fill 'em; ain't they vicious-lookin', eh?" They look any thing but vicious, or over-stout for that matter, but have the brown color and ruggedness of a couple of quick-witted tramps. Their trousers are rolled up to their knees, and they have enormous checked shirts, with other enormous articles of apparel, including felt hats. Chôisé regards them a moment in contemplative silence, and then breaks out in spontaneous admiration.

"I haven't any notion of grumblin' at 'em, bless 'em; it's only my play. I love to see 'em stuff, it's a mighty sign of heartiness. Them chunks of bread is so much siftin' and sortin' to me. Just look at them fingers, them long arms, made a-puppos for layin' out cinders and bones." The two boys here contemplate their own arms, as if this were an entirely new light to look at them in, and afterward take some surreptitious nourishment.

"That one to the right," continued Chôisé, who, though he bore a French name, had not the slightest foreign accent—"that one to the right, with the biggest bread, is a roarin' tiger after rubbage." He never by any chance mentions rubbish. "Put your barr'ls on the sidewalk of a morning, and he'll know it two blocks off, round the corner, even afore you've shut the door on 'em; that's strange, but true. And you should see 'em separatin'. Nothin' like it. 'Coal can't get away from 'em. Give us two heaps of ashes of the same size, and them young villins will beat me by an even peck to the two bushels afore my very eyes."

He again gazes upon them in mingled amazement and pleasure, as he feels the justice of his own summing up, and they, meanwhile, slip back sheepishly into the obscurity, to finish their bread uninterrupted.

Chôisé here leads the way to the garden again, where he thus notices the dogs, who are stretched in the hot sand, in grumbling contentment.

"Here's a curious set. Here's brains for you. Here's sharpness and knowin'ness. That one there, he's the middle one, he has the say of the other two, and a wonderful lot he is. He's partic'lar on such truck as bones. You can't get him past bones. Ah, and what would I give for such an eye for ashes as he's got! If you lopped his tail off with an axe, you couldn't hurt his feelin's more than to go by a box full of red-ash cinders. He'll howl as if his heart would break, and down he'll go onto the pavement and work hisself into such a tear that the crowd 'ud pitch me inter the river fur fo'punce; and so I have to go and get the ashes in spite of myself."

At this reflection, Chôisé wags his head with amusement, and glows upon the red-eyed, sulky, and rather doubtful-looking dog, with much the same fond admiration he previously lavished upon the boys. After some time he suddenly volunteers, under a hint of beer, to harness up his team. He rushes off into the house, uttering some voluble, unintelligible commands to his establishment as he goes, and quickly reappears in a frock of Dundee sacking, a rimless cap, with a twist of cloth about his waist, and a longer and more effective-looking hook in his hand. He plunges upon the patched and clumsy harnesses, and quickly adjusts them to the ready dogs, who, having minded his cries, have backed patiently up to the door. They immediately trot off to the cart, where the boys seize some diminutive

whippetrees and attach them to it, and then grasp three common barrels and place them within. Chöisé takes a rapid, field-marshal view, and then steps within the shafts, and after taking a professional position illustrative of watching dust-boxes and garbage-heaps, in which picture his dogs also participate, he then sets off in a short circle designed to show both sides, amid the unchecked enthusiasm of the boys and the pride of madame, who warmly asserts that "she'd know 'em in a howling wiljerness, for they're ez nat'ral as kin be."

A very ragged boy appears upon the scene with a slip of paper, which appears to be an order for coal, which Chöisé instantly fills, pocketing some money with much pleasure.

"Five shillin's a barr'l is the rulin' rate. We've got oceans of custom. There's a laundress beyond on the rocks, who takes as high as two bushel a day in good times. Then the beer-man he comes in for a couple of barr'ls very often. Then there's a hod here at ten pence, and a basket there for five pence, and the making of a kettle of water for less, and so with the bones and iron and junk gen'rally, we squeeze along."

Soon the whole family, madame included, dressed in some of the same Dundee sacking, go to work at a monstrous heap of ashes, having ready to their hands a formidable array of sieves, shovels, and barrels; and almost simultaneously disappear in a whirling cloud of fine reddish dust, from which comes a sound of rapid sifting, raking, breaking, and rattling. A whiff of wind discloses them occasionally, begrimed and half-choked, with their enveloping garments blowing fiercely about them, and their four brown faces transformed into dusty corrugated masks, while from their hands and feet there issues a stifling mass which envelops them, and for the time extinguishes them.

Chöisé's cottage, or rather hovel, is a pattern of most of those which surround it, though in some cases they lack its slatternly build, and show some taste, or attempts at it. The whole place is a great collection of numberless refuses in all senses, a grand heap to be moved on, as soon as intelligence and decency require its place, but as a feature, its forcible extinguishment would do much more serious damage than a sufferance of it would ever entail on the community.

ALBERT WEBSTER, JR.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER XIX.—YOU CANNOT LET ME HELP YOU?

WHEN Katharine entered the hall, the sounds which proceeded from the drawing-room assured her at once that the vigil of the ladies was over, and the fox-hunters had returned. On the staircase the first person she met was Annesley, who was descending as she went up. He stopped and held out his hand.

"Good-morning, Miss Tresham," he said, with a smile. "We are back again in a most dispirited and luckless condition—dogs and all fairly outwitted by a fox. Won't you come and take a game of billiards, and help me to forget it?"

"Not just now," said Katharine, hardly knowing what she was saying. "I—I am just going to my room."

He started a little, and still holding her hand, gazed earnestly into her face.

"Something is the matter," he said, quickly. "I never saw you so pale before. Katharine—Miss Tresham, has anybody done anything to annoy you?"

"Nothing," she answered, eagerly. "Why should you think so? Everybody is very kind. There!—please let me pass. I am not well."

"Something is the matter," repeated he, still oblivious of courtesy, and keeping his place before her. "If you would only tell me—if it is any thing I could set straight—"

"It is not any thing you could set straight," interrupted Katharine, almost wild to get away. "Mr. Annesley, will you—will you please let me pass? I have told you I am not well."

He moved aside, and, disregarding the pained look on his face, she

flew by, and the next moment he heard her chamber door open and shut.

The young man stood for a minute where she had left him—pain gradually giving way to surprise on his face. Then he went down, and, as he crossed the hall, his mother came out of the library and joined him.

"Are you going out, Morton?" she said. "I will walk with you a little way. I have something to say to you."

"I was not going out," he answered; "but I can go, if you wish to speak to me."

Without any further words, they passed out, and took the same path which Katharine and Miss Vernon had taken an hour or two before. After they had gone a short distance, Mrs. Annesley was the first to break the silence.

"Was that Miss Tresham you met on the staircase, Morton?"

"Yes, it was Miss Tresham," he answered, and in a moment it flashed across his mind that somebody had been guilty of slighting or annoying Katharine, and that his mother knew of it. "Something was the matter with her," he said. "I never saw her look so offended. She did not seem like herself at all. Somebody must have offended her," continued the young man, with suppressed anger in his voice. "Mother, if you know who it is, if any—"

"Stop a moment, Morton," said Mrs. Annesley, with dignity. "You forget that you are speaking of your own guests—of ladies and gentlemen who are incapable of being rude to any one. Nobody inside the doors of Annesdale has done any thing to wound or annoy Miss Tresham; but what has occurred outside of them," she added, significantly, "it is quite beyond my power to say."

"What do you mean?" asked Morton, to whom this distinction was quite unintelligible.

"I mean that something has happened which I think you ought to know. I was in the observatory an hour or two ago, showing the view to Mrs. Dancy, when I happened to have my attention directed toward the entrance gates. I saw two figures which I easily identified as Miss Tresham and Irene Vernon emerge from the shrubbery just as a man was entering the gates. Of course, at such a distance the action was rather confused to my sight, but I could distinguish very plainly that a recognition took place between the man and Miss Tresham, and that, after Irene Vernon had first gone on alone, he and she entered the shrubbery together. I thought it singular, but nothing more, until I went down-stairs, and, after a while, Irene came in—still alone. I asked her what had become of Miss Tresham, and she evaded the question. It was only when I told her what I had seen, that she acknowledged she had left Miss Tresham in the grounds with this stranger. She had evidently been requested to keep the matter secret, for she begged me not to mention it, and, of course, I shall not do so—excepting to yourself, who certainly have a right to know. When you met Miss Tresham, she was just coming in; and all this happened I should be afraid to say how long before."

"Did Miss Irene know the man?" said Morton, speaking very grimly.

"No, she had never seen him before. He was a stranger, she said—and young and handsome."

"And what explanation did Miss Tresham give to her?"

"She did not tell me. She was very reticent, and evidently disliked to mention the matter at all. I asked her why she had not urged Miss Tresham to bring her friend to the house. She replied she had done so; but that she—Miss Tresham—had declined."

"And there is no doubt of this?" said Morton at last, after a pause.

"There is not the least doubt of it," answered his mother. Then, after minute: "Morton, is it not all as I told you? Can such a woman as this be trusted?"

"What has this to do with the question of her being trusted?" he asked. "Do you think I will doubt the woman who is every thing to me, because some man—some friend or relation, perhaps, of whom we know nothing—comes to see her, and she, meeting him in the open air, keeps him there, instead of taking him into a house full of people like that yonder?"

"But why should she ask Irene Vernon to keep the matter secret, if it was only some friend or some relation, as you say?"

"Did Miss Vernon say that she had asked her?"

"No; but I saw very plainly—"

"You are determined to see every thing against and nothing for

* ENTERED, according to Act of Congress, in the year 1911, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

her, mother," he said, a little wearily. "Can't you put the matter as if it concerned somebody else?—can't you see that if it did concern somebody else, you would not think it of any importance?"

"I see that you are wilfully blind, and wilfully determined to go your own way," she answered. "Well, I have done my duty—I have warned you. Since you will not heed the warning, you must pay the penalty of your obstinacy and folly, but my heart sinks when I consider what a penalty it will be. We had better go back to the house now—I have a great deal to do."

They went back to the house, and did not speak of the subject again; but, though Morton had so summarily silenced his mother, he could not silence the thoughts of his own mind, or the throbs of his own heart. "What did it mean?" he asked himself again and again, with the same feeling which had overpowered him when that letter, which had been the direct consequence of his mother's act, had dropped from the pages of the "Adelaide." His perplexity was not ended, nor his anxiety stilled, by the fact that Miss Tresham did not appear again that day. She was lying down—she had a headache, he was told, when he inquired about her; and, with this most unsatisfactory information, he was obliged to be content, and make, or try to make, himself agreeable to a score or more of people. It was fine social training, no doubt, but very unpleasant in the process. Any thing that teaches you to conceal your feelings, and smile in the face of the world when your heart is breaking—if hearts ever do break!—is considered a benefit; and, certainly, Morton made great strides in this branch of social art that day. He had to hear a great many remarks from other people, too; for Langdon, Talcott and Co., were quite concerned for Miss Tresham's indisposition, and kept saying how very unlucky it was, and the ball that night, too! "There is no danger but that she will be well enough for the ball," said Miss Lester, who heard some remark of this description. "What! any girl in her senses stay away from the ball—and such a ball, too! I'll believe it when I see it, and if you care to wager, Cousin Tom, I'll bet you a new collar for Spitfire, that she comes down!"

"I'll wager, certainly, Maggie," said Cousin Tom. "A new collar for Spitfire, is it?—against what?"

"Oh, any thing you choose. Shall we say a purse? I wouldn't, if I was not sure that I shall not have the trouble of making it."

"A purse, then," said he, taking out his note-book, and entering an imposing register of the wager.

Dinner was early that day, for the ball was to come off in the evening, and it was necessary that the whole force of the establishment should be employed in preparation. This was the ball of which Katharine had spoken to Mrs. Gordon, of which she had thought as the first and greatest item in her Christmas enjoyment; and now it was with a sick heart and a throbbing head that she faced the prospect of it, and the necessity of rising to dress. As she lay on her bed with the room darkened, the fire burning with a soft, crackling content, a wet handkerchief over her aching eyes, and a bottle of cologne-water in her hand, some despairing thoughts on the perversity of human circumstances occurred to her. She had come to Annesdale meaning to leave her weight of anxiety behind, and to enjoy herself for a short time with the natural enjoyment of youth; and all of a sudden every thing was dashed with bitterness! Poor Katharine! Very stern troubles were staring her in the face, but still she had time to give a sigh to her murdered pleasure. "If it had only been the day after the ball!" she thought to herself—and it is to be hoped that she will not be accounted utterly frivolous for doing so!

She had at last risen languidly, and was looking with critical attention in the mirror, regarding her pale cheeks, her red eyes, and her swollen nose, wondering if it would be possible to bring all these features into order, or if she had not better make a virtue of necessity, and resign the ball, when the door opened and Miss Lester entered.

"So you are up!" cried this young lady, in her liveliest tone. "I am glad of that—glad because you are better, and because I have a wager on your going to the ball. You are going, are you not?"

"I was just considering about it," said Katharine, doubtfully, "Come and tell me what you think. I am looking frightfully, you see."

"I don't see any thing of the kind," said Miss Lester, whose opinion was rather biased by personal interest. "Your eyes are red and—your—nose—a little. But that is because you have been crying. If you don't cry any more, by the time you are dressed they

will be all right. Then you are pale; but a little rouge—do you ever use rouge?"

"Never."

"You don't think it a sin, do you?"

"I don't think any thing about it. As a matter of personal taste, I don't like, and don't use it—that is all. I confess, however, that the sight of it affects me very much in the same way that a coarse perfume does. The two things always seem to me to go together."

"I don't use it myself," said Miss Lester, philosophically, "but a great many girls do. I have a cousin who paints dreadfully. However, paleness is becoming to you—you are generally pale—and I think you might go down. Dancing will soon give you a color. If any personal arguments are needed, Cousin Tom is half crazy to see you, and Spitfire will get a new collar if you go."

Katharine thought of the unwelcome visitor whom Spitfire had forced upon her notice that morning, and felt very little of the grateful esteem which would have made her anxious to secure a new collar for him. But still she suffered herself to be persuaded—especially as she did not need very much persuasion—and, after a short gossip in the fading twilight, the serious business of the toilet began.

The ballroom at Annesdale formed a wing of the main building, and had been built by Morton since affairs came into his hands. It was a large, and (for a ballroom), decidedly tasteful apartment—ornamented sufficiently to avoid the look of disagreeable bareness, yet not overloaded by any means, and with every facility for light and warmth. It was a beautiful apartment, Katharine thought, as she entered it for the first time that evening, and saw the lofty ceiling painted in brilliant fresco, the double line of columns down the sides, the heavy green garlands that swung in festoons from one to another, and the lights glittering in every direction, shining on the scarlet holly-berries, and reflected back from the smoothly-waxed floor. On a raised stand at the upper end of the room, the band was peeling forth a march, and the guests, who had been lingering in the drawing-rooms, in the green-house, in the library, in every place that was thrown open to the public, began to pour in. A few couples were promenading in time to those strains, but with the majority there was an exciting rush to make engagements, and secure a desirable position in certain desirable ball-books.—"Are you engaged for the third set, Miss Josephine?"—"May I have the fifth on your list, Miss Annie?"—"Stand back, Tom, I have a word or two to say—Miss Mary, mayn't I have the second?"—"Bella, I wish you would remember that mamma don't like you to waltz."—"Certainly, Mr. Ford, you can have the pleasure of—the tenth set, did you say?"—"Dancey, who is your partner for the first cotillon?—Get one, man, in a hurry, and be our *vis-à-vis*—Miss Nelly's and mine."—"Stop there, George, stop—come here and help us to make up a set."—"A polka, did you say, Mr. Anderson? I never dance the round dances."

All this was sounding at once in Katharine's ears, as she stood near a large pillar, looking very pale and pretty in her white dress, wreathed with blue convolvulus, when Annesley came up to her.

"I have been looking for you everywhere," he said, hastily, "and I have only time for a word. Will you give me the second set, and save two or three more for me?"

"I cannot give you the second set," she answered. "It is Mr. Talcott's."

"The third, then?"

"That belongs to Mr. Hallam."

"The fourth—fifth—sixth—any thing! Permit me—" he suddenly leaned forward, and, taking the little ivory toy that hung at her waist, ran his eye rapidly over the list of engagements, scribbled his initials in two or three vacant places, then, with a smile and a "Thank you," was gone. A moment later, Mr. Langdon left the side of a young lady with whom he was negotiating for a waltz, and claimed Katharine's hand for the dance about to commence. The measure of the music changed, the confused mass of figures formed into magical squares, the wall-flowers of both sexes fell back and clustered around or beyond the columns, and the amusement of the evening began in earnest. To Katharine it would have been like enchantment, at another time; but now, above the sound of the music, the tread of dancing feet, the shifting to-and-fro of brightly-clad forms, she saw one face and heard one voice that banished all gayety from her heart, and took all lightness from her step. Despite her efforts to the contrary, she seemed so unlike herself that her appear-

ance struck a gentleman standing near the set in which she was dancing, a gentleman whose tall head towered somewhat above the throng of lookers-on—for all La Grange was in force there that night, the county people thinking nothing of a ten-miles' drive to Mrs. Annesley's Christmas-ball. His intent gaze caught Katharine's attention at last. In the course of *chassé* back and forth, she looked up, saw him, and smiled. "Oh, Mr. Warwick!" she said, in a tone that surprised her partner.

"Mr.—*who*?" he asked, looking round.

"Mr. Warwick," answered Katharine, still smiling, and nodding to Mr. Warwick across the set. "I am so glad to see him," she went on. "It is like a home-face in the midst of strangers. I must speak to him as soon as the cotillon is over. I want to ask about Mrs. Marks, and the children, and all of them. I feel—"

She stopped suddenly, and her face changed so much that her companion absolutely stared. A sharp recollection came to her of the difference that these few days had made in her life, of the man who had seen Mrs. Marks, and the inquiries which would meet her when she returned to the familiar house in Tallahoma. Of course Mr. Langdon understood none of this, and, seeing her hesitate and turn pale, he at once conceived a suspicion of Mr. Warwick, and glanced across the room at that gentleman. Being somewhat reassured by his sedate, middle-aged appearance, he took up Katharine's sentence.

"You feel—what? Not home-sick, I trust?"

"I feel as if it had been such a long time since I left home," she answered, absently. "That is always the case, you know, when one has been among new scenes and new people.—First gentleman and lady, did they say? You are the first gentleman, Mr. Langdon."

Meanwhile, Morton was dancing with Miss Vernon, in quite another set, at the upper end of the room. He thought, and so did a great many other people, that Irene had never looked more lovely than on that night. Fashions change very much in thirty years, and to describe her costume would probably be to bring a dreadful picture before the eyes of to-day; but everybody said how charmingly she was dressed, and certainly the shining pink silk that she wore, with rich point lace falling from her shoulders, was as becoming as possible. Then her cheeks were flushed, and her eyes were bright, and her hair looked like spun gold, as it gleamed about her graceful head. Morton, who had never thought very much about her beauty, suddenly opened his eyes, and admired it with quite a fervor of enthusiasm. "I never saw you look so well," he could not help telling her more than once—though the remark strictly interpreted was any thing but a compliment.

"Perhaps you never looked at me before," she said, though she hated herself for saying it. "Nobody else seems to think that I am looking unusually well to-night."

"Shall we take a vote on the question, for I don't fancy the imputation of being a mole or a bat?"

"No, thank you. I'll take the fact of my unusual good looks or your unusual good-nature, for granted, in preference to that. *A propos* of appearance, don't you think Miss Tresham is looking very well?"

"Very pretty, but not very well. She is too pale."

"Yes, but she is one of the few people to whom pallor is becoming. And those morning-glories—are they not beautiful?"

"Yes," said Morton, catching a glimpse of the morning-glories in question, as their wearer moved forward in the dance. Then he saw his way to a sudden inquiry, and made it without loss of time.

"I met Miss Tresham on the staircase this morning, just after my return, and she seemed very much distressed and agitated. I hope nothing unpleasant occurred while you and she were in the grounds?"

"Nothing," answered Miss Vernon, with a reticence that did not escape his observation. "How did you know that I was in the grounds with her?" she added, with a keen glance at him.

"My mother told me," he answered. "Don't think that I was busying myself with matters which did not concern me," he added, with a quick flush coming over his face; "but when I met Miss Tresham, I saw at once that something had annoyed her, and I thought it might be something I could remedy, so I went to my mother"—at the moment, Morton really forgot that his mother had gone to him—"and she told me that you had been with Miss Tresham, and mentioned that she met some one—"

"I did not mention it at all," interrupted Miss Vernon, bluntly.

"Miss Tresham asked me—that is, I thought it likely she would not care for me to speak of the matter, so I was sorry Mrs. Annesley had seen the—the person come in the gate. I answered her questions, that was all. I shall not answer yours, Mr. Annesley, so I beg you won't ask any."

"I am not going to ask any," said Morton, a little amused. "I would not think of such a thing as meddling with Miss Tresham's affairs. But she seemed so much agitated—"

"Things agitate at one time, that would have no effect at another," said Miss Vernon, coolly. "I should probably be agitated if I was living in Russia and you suddenly appeared before me—though there is nothing at all agitating in seeing you here, you know."

"I understand. But Miss Tresham I am sure can have no reason for concealing—"

Miss Vernon interrupted him again, remorselessly.

"Miss Tresham did not ask me to conceal any thing, Mr. Annesley but I have learned by experience that silence is golden, and speech is silver—or base copper, rather, when it takes the form of silly tattling. I do as I would be done by. There are many reasons which might make me wish to conceal—that's a hateful word!—the visit of some embarrassing friend or relation, from people who had no right of espionage over my conduct, and so I am not quick to suspect other people for doing the same thing."

"Thank you," said Morton, before he knew what he was about. Then he added, with a blush: "You don't know how much I admire and respect such sentiments. There are not many women like you, Miss Vernon."

"There are thousands much better," said Miss Vernon, with a sharpness that quite took him by surprise.

While this conversation was going on, the cotillon ended, the last bows were made, and, as Mr. Langdon was leading Katharine away, Mr. Warwick came up to her.

"Shall we go into the drawing-room and get an ice?" the obliging Cousin Tom was saying, when he found himself summarily put aside. "Mr. Warwick!—I am so glad to see you," Katharine cried; and Mr. Warwick looked at her companion, as he said: "I have a great many messages for you, from Bessie and the children. Do you care about hearing them?"

"Of course I do," answered she, warmly; and upon this, she withdrew her hand from Mr. Langdon's arm, and took instead the one Mr. Warwick offered.

"I will see you again, when the fourth set comes round," she said, with a smile, to the former gentleman, and in this way he found himself deserted, just as he had flattered himself with the expectation of a pleasantly, uninterrupted *lété-à-lété*.

"So Annesdale and all its gayety has not made you forget Tallahoma and the school-room?" said Mr. Warwick, as they walked away. "I could hardly realize that you were yourself, when I saw you dancing a little while ago."

"If I am I, as I do think I be," said Katharine, with a laugh, "I have certainly not forgotten the school-room, or anybody connected with it, Mr. Warwick. How is Mrs. Marks, and how are the children?—did Sara and Katy go to see their aunt?—and has Nelly's cough given any more trouble?"

"Bessie and all the children are well, and sent you more love than I could carry—Katy and Sara did not go to their aunt's, and Nelly's cough is quite well, I believe."

"Has nothing happened since I went away? I feel as if a great deal ought to have happened."

"I think every thing has gone on exactly as usual, excepting that it may compliment you to hear that you have been very much missed by everybody. When Dick cut his hand the other day, he disgraced his manhood by crying because you were not there to bandage it up."

"Has Dick cut his hand? I am so sorry. How did he do it?"

"I was foolish enough to give him a box of tools as a Christmas-gift, and the result was three accidents in the course of as many days. Katy was very anxious to come with me to-night."

"I wish you could have brought her," said Katharine, sincerely.

They had left the ballroom by this time, and were in the drawing-room, which was thronged with people laughing, talking, eating ices, making picture-like groups everywhere.

"Is there a quiet spot to be found anywhere?" asked Mr. Warwick, looking round. "Twenty years ago, I might have liked this kind of thing; but now I find that I am very much out of my element."

You know those messages I told you about. Is there a quiet place in which I could deliver them?"

"Suppose we try the library," said Katharine.

They crossed the hall to the library, and found only one or two whist-parties in possession of it. At the farther end, a sofa was fitted into a sort of alcove between two bookcases, and to this Katharine led the way. She sat down first, and looked up at her companion out of the soft gloom—her white dress and the blue flowers in her hair showing in bright relief against the dark background.

"Will not this do?" said she, smiling; and somehow the little scene came back to John Warwick long afterward, touching him again as it touched him then.

"Yes, it will do very well," he said, sitting down by her. Then he added, suddenly, "You are looking very badly. Have you been sick?"

"Not at all," answered she, growing a little paler. "I have been quite well, and enjoying myself very much. Do you know that you have terribly keen eyes?" she added, trying to laugh, and not succeeding very well.

"I hope I have serviceable eyes," he answered; "but it would not require very keen ones to see that something is the matter with you. If you have not been sick, you have been worried—and that is worse. I may be blundering in speaking of it," he went on, "and, if so, you must forgive me, but I was struck by the change in your appearance when I saw you dancing."

"I have been sick all day," said Katharine, forgetting her contrary assertion of a moment back. "That is, I have had a headache and been in bed with it. One does not look very well after a thing of that kind."

"No," said Mr. Warwick, regarding her with a pair of eyes which, for the first time, she found uncomfortably penetrating. "If you have been in bed all day," he added, "I suppose you did not see a visitor, who called at Bessie's this morning, and whom she directed here?"

Dim as the light was, he noticed—he could not avoid noticing—the crimson tide which in a moment spread over her face and neck.

"Yes, I saw him," she answered; and, as she spoke, she gave a piteous, imploring glance, that reminded him of the look sometimes seen in an animal's eyes before the knife of the butcher descends and strikes home to the heart. Its unconscious pathos touched him; but the lawyer in his composition enabled him to persevere.

"Bessie's curiosity was quite excited," he said. "You know it takes very little to excite her, and it seems that the gentleman—whom she described as young and handsome—asked many questions about you. That was enough to form the groundwork of a romance, which she has been building ever since. Her only fear is, that you may be induced to leave her, and that, she says, would break her heart."

"Mrs. Marks is very good," said Katharine, forcing a smile. "But she need not fear. I am not likely to go away. The gentleman who called to see me was"—a pause, and a great gulp of rage and self-contempt—"was a person whom I knew in England."

"So he said," remarked Mr. Warwick, rather dryly.

"I hope he did not annoy Mrs. Marks in any way?" said Katharine, catching the intonation of his voice. "I—I do not think she is likely to see him again. He will leave Tallahoma in a few days—to-morrow, perhaps."

"He did not annoy her at all," Mr. Warwick answered. "I hope I have not said any thing to make you think so."

There was a pause after this. Katharine felt faint and sick, but she kept her seat—whatever he should say next, she must be ready to answer. Mr. Warwick, meanwhile, said nothing—his face looked somewhat severe, as he gazed past her; but that was its usual expression when at rest. In this lull, the voices of the whist-players sounded.

"Three by cards, and two by honors, sets us five, and four before, is nine."

"You should have returned my lead of spades, Mr. Barry, and we might have—"

"If you had led out trumps, as you ought to have done," cried an excited voice from the other table, "they could not have made a trick. I held every high diamond, sir, and every one of them trumped!"

"We threw away the game by that play of hearts, Mrs. Dargan. It gave them the lead, and then—"

This was the kind of talk which came in and bridged over Katharine's suspense. It is astonishing how oddly conscious people are

of such things at such times. When the last great struggle comes, and the soul is about to go forth, shall we, even then, hear and notice the bird that sings at our window, and the child who laughs in the street below?

"Miss Tresham," said Mr. Warwick, turning round abruptly, "do you remember the day we walked out to the pond, and I told you that something was preying on your health and spirits?"

"Yes," Katharine answered, "I remember it."

"And do you also remember that I asked you if I could do any thing to relieve you?"

"Yes, Mr. Warwick, I remember that also—very gratefully."

"Well, I don't wish to force your confidence, but one glance at your face to-night told me that the anxiety which I saw then had made greater strides—had, in fact, been realized. As I told you before, if it is any thing relating to ideal troubles, I can do nothing for you; but if it is real—if it is practical—Miss Tresham, remember that I am both a man and a lawyer, and that, in either character, I am ready to serve you."

"Mr. Warwick, you are very good—you are more than good," said Katharine, almost ready to give way to the childish relief of tears. "Don't—please don't think me ungrateful. I feel your kindness in my very heart, and—and thank you for it. But I cannot do any thing else."

"You cannot let me help you?"

"No—I cannot."

That ended the matter. After a minute, Mr. Warwick rose and offered his arm. "Your partners will be looking for you," he said. "I must not monopolize you so long. Have you any message for Bessie?"

"My best love, and tell her I will see her to-morrow."

"What, are you coming back to Tallahoma?"

"Not to stay—I promised to remain here until after New-Year—but on business. There is Mr. Talcott coming for me now."

"I have been looking for you everywhere, Miss Tresham," said Mr. Talcott, quite breathless. "The dancing began some time ago, and I am afraid we shall not get a place unless we make haste."

"Don't let me detain you," said Mr. Warwick. "Good-night."

"Shall I not see you again?"

"No, I only looked in to be able to tell Bessie how you are getting on. I am going back to town now."

He was as good as his word, and Katharine had no further glimpse of him that night; but amid all the music and dancing, the gay voices and bright smiles, his voice sounded, and she heard again and again the words, "You cannot let me help you?" Her heart gave back an answer, for every now and then she caught herself murmuring, "If I only could!—ah, if I only could!"

CHAPTER XX.—MR. WARWICK'S NEW CLIENT.

ABOUT the time that Katharine threw herself down on the bed, and was foolish enough to cry until she made her head ache, Babette was tramping along the road which led from Tallahoma to Morton House. She had been sent on an errand by her mistress, and was returning with two or three large parcels under her arm, disdainfully regardless of the fact that she was the object of much attention and remark on the part of several small boys in her rear. They knew better than to come within reach of her hand, of which more than one of them had felt the weight; but, taking care to keep at a respectful distance, they followed her beyond the corporate limits. Indeed, Babette was a sufficiently remarkable figure to excite attention in a place much more used to remarkable figures than quiet Tallahoma. Besides her usual foreign costume, she had, in consideration of the muddy state of the roads, mounted a pair of sabots, and in them she went boldly clattering along, with her dress tucked up even shorter than the walking-skirt of a fashionable girl of the present day. "Good gracious, aunty, where'd you get your shoes?" more than one audacious boy inquired; but aunty's short nose only went a little higher in the air, and her keen black eyes only gave a little quicker gleam by way of reply. Her fierce appearance quite awed the good folk of the village. They had an idea that she was a sort of dragoness, whom Mrs. Gordon had imported for special guard and defence. Poor Babette, whose temper was irascible, but who was really of an excellent disposition, and whose appearance only was against her, had no idea that when

she walked into a shop, with her large gold ear-rings bobbing on each side of her swarthy, stern-looking face, the clerks fairly quaked, and would have given any thing to avoid the perilous duty of serving her.

She was well served, however; and she had made her purchases and was finally on her way home—tramping along the narrow foot-path that ran by the side of the muddy road, close under the zigzag rail-fences, humming to herself in French a sort of jingling refrain, and now and then casting looks of defiance behind to see if any of her troublesome train were in sight. They had given up the pursuit, she found at last, and the gates of Morton House were almost in sight when a man's figure appeared, advancing with quick strides along the foot-path toward her. Babette hardly noticed him, her head being full of other things, for she was making a rough calculation mentally of the money she had spent, and deciding that she had been cheated beyond that point where forbearance is said to be a virtue. It was all her mistress's fault, however. She had bidden her buy the things, and never mind about the price. "Eh bien, if people will be extravagant!" Babette said to herself with a shrug. Meanwhile, the gentleman was thinking just as little of this strangely-clad figure clattering along the road to meet him. In fact, he did not notice her at all. He was thinking of other things, too, and gnawing his under lip as he had gnawed it in speaking of the money a little while before. It would be hard to tell which of them was thrilled with the strangest shock of surprise when they came suddenly face to face, and, looking up, recognized each other.

"Mon Dieu!" gasped Babette, and the parcels absolutely rolled out of her arms into the mud, as she stood helpless and aghast before him.

"What!—Babette!" cried the other, in astonishment evidently as great and uncontrollable as her own. He put out his hand and grasped her arm, as if to make sure of the fact of her bodily presence. But Babette rudely pushed him away. Evidently she had no more desire than Katharine had manifested to salute him cordially.

"Keep your hands to yourself, Monsieur St. Jean," she exclaimed, sharply. "Mon Dieu!—what are you doing here?—as if madame, poor lady, has not suffered enough for you to leave her in peace!"

"So your mistress is here!" said he, quickly. "Good Heavens! how near I was to going away without knowing it! Where—where is she, Babette?"

But the very question betrayed him. Babette saw that this encounter had been accidental, and that whatever reason had brought him here, the presence of Mrs. Gordon had no share in it. "How near I was to going away without knowing it!" he had unwittingly said, and Babette's ears were quick. So were her wits for that matter, and in a moment her reply was ready. She had no time for cunning subterfuge or evasion. The plain road to mislead him was in downright falsehood, and in downright falsehood she unhesitatingly took refuge.

"Madame is not where you are likely to find her, M'sieu St. Jean," she said, with ill-simulated triumph. "Thanks to le bon Dieu, she is far enough away, and it is not I who is going to tell you where she is. Ma foi! I would tell the devil sooner!" she added, bitterly.

"You are telling a lie," said the gentleman, coolly, "and that is not what I expected of a good Catholic like you, Babette. I wonder what the priest will say to this when you go to confession."

Babette's face fell for an instant; but she remembered what was at stake, plucked up courage, and answered boldly and volubly: "It is not for a scoffing heretic like you, M'sieu St. Jean, to tell Christian people that they are liars. I say that madame is not here, nor anywhere that you are likely to find her. And I'll thank you," she went on, raising her voice, "to stand out of the path and let me go on."

"Where have you been, and where are you going, and with whom do you live, if your mistress is not here?" asked St. John, coolly keeping his position in front of her.

"Mon Dieu! what business is it of yours?" demanded she, bursting into one of the sudden furies to which the servants of Morton House were well accustomed. "I shall tell you nothing," she continued, trembling with passion. "Madame is not here. I am staying with *une amie*—I have been to town to make purchases. If you will not let me pass, I shall go round you."

"Pass, by all means," said he, moving aside with a peculiar smile.

She carefully gathered her parcels out of the mud, and, hugging them close in her arms, marched stolidly by him—grateful for, yet half incredulous of, this welcome release. She had not gone five paces

before she heard his step behind, and knew that he was following her. Instantly she faced round upon him, her black eyes gleaming, and her swarthy face all aglow.

"Comment, M'sieu St. Jean!" she cried, indignantly. "You say I may pass, and, after I pass, you follow—you dog me! Call you this conduct of a gentleman?"

"If you won't give me any information, Babette, I must simply find it out," said he, laughing at her anger. "You needn't excite yourself. I am only going with you to your friend's. There is no harm in that, I am sure."

"Mon amie does not wish to see you," said Babette, almost out of her senses, with indignation. "She would sprinkle holy water if you came in sight of the door."

"I have no doubt of that," said he, still smiling so provokingly that she felt inclined to throw her muddy parcels in his face; "but still, I must accompany you."

"Eh bien! then I shall not go," said she; and, to his great surprise, she wrapped her shawl around her more comfortably, and sat down deliberately on a large stone that lay in the fence corner. Once seated, she looked up at him triumphantly. "I can stay here as long as you can, M'sieu St. Jean," she said, "and perhaps a little longer."

For the first time she had the best of the situation, and, for the first time also, St. John lost his temper.

"Confound you!" he said, savagely. "Do you suppose I am such a fool as not to know that your mistress is near at hand somewhere, and that you are lying like the father of lies himself? Do you suppose I can't find out without any help from you? I have only to walk into the village yonder, and ask a few questions, to learn all that I want to know. I shall ask them, too; and you may tell your mistress, with my compliments, that I shall do myself the honor of calling on her before the day is over."

With this, he turned on his heel, and walked off toward the town. Babette eagerly watched him out of sight; she even followed him to a bend of the road, and saw his figure vanish in the distance, before she could believe that he was really gone, and that he might not return and dog her steps. Then, as fast as the sabots would allow, she hurried to the house, making no pause until she had burst in upon Mrs. Gordon with the news which she knew would be to her the most unwelcome that could be told.

"Madame!" she cried, as the startled lady looked up from her cushions in astonishment; "madame!—Ah! what a misfortune! It is terrible!—it is enough to break one's heart," said the excitable Frenchwoman, almost sobbing; "but, as I was coming back from town, madame, I met—out here—in the road—Monsieur St. Jean!"

Mrs. Gordon, who had not done more than languidly cross the room for weeks, gave one convulsive bound from the sofa, and stood erect on the floor.

"Babette!" she gasped. More than that she could not say.

"Monsieur St. Jean!" repeated Babette, lifting her arm with a tragic gesture, as if she called upon Heaven to witness the truth of the fact she asserted. "I met him in the road, madame, not farther from the gate than you could throw a stone; and ah, mon Dieu!" said she, shaking her head, "what shall I have to suffer for all the lies I told!"

"St. John!" said Mrs. Gordon; and she had hardly said it when she grew white as a sheet, and sat down suddenly. "Yonder!—that phial on the table," she panted, brokenly, as Babette hurried to her. Well used as she was to these attacks, the maid was frightened—she had never before seen her mistress look like this; she had never known her face so ghastly, or her breath so painfully short. The severity of the paroxysm did not last more than a minute; but, when it was over, Mrs. Gordon sank back on the sofa utterly exhausted. "Wait—wait a little," she said, when Babette began to speak, and the latter had discretion enough to hold her tongue. She bathed her mistress's face for some time in silence, and it was not until Mrs. Gordon opened her eyes, and said, "Well, Babette?" that she broke into a voluble history of her encounter, and of all that had been said on both sides. By the time she finished, she had worked herself into such a state of emotion, that she was fairly weeping and wringing her hands.

"Madame, let us go!" she exclaimed. "Let us not stay here. He will come.—M'sieu will come—and he will take you and make you wretched. Madame, let us go!—Mon Dieu! let us go!"

"Soyez tranquille!" said Mrs. Gordon, faintly. "We must bear what we must bear, my poor Babette. But you need not fear—he will not take us again. Go and order the carriage."

"To leave here, madame?"

"No—only to drive me into town. Don't waste time, Babette—go!"

Babette went, and, when she returned, she found her mistress dressing with trembling haste. "My bonnet, Babette," she said; and, as Babette ran to seek the bonnet, which had not been used since her mistress entered Morton House, two months before, she could not help wondering vaguely what this sudden movement meant. Whatever it was, Mrs. Gordon certainly looked more like herself than she had done in many a long day before. Her eyes were bright, her cheeks were flushed, and, as she tied the strings of her bonnet, and drew the long crape veil over her face, she felt with a strange, wild thrill, that stagnation was over, and the breath of life and combat had come to her again. It made another woman of her. It gave her strength, and will, and purpose, that no one would have dreamed of her possessing as she lay languidly on her sofa, and watched one dull day after another go by. Before she entered the carriage, she had all the windows put up, and all the curtains put down. Then she bade the coachman drive to Mr. Warwick's office in Tallahoma.

To Mr. Warwick's office in Tallahoma the lumbering old carriage accordingly proceeded, rousing a good deal of interest in the quiet streets of the little village, and startling a group of loungers who were smoking their pipes in the bright sunshine outside Mr. Warwick's door. The lawyer himself was not of the number. A man had called on business, and he had taken him into the office about ten minutes before the carriage appeared. His astonishment, therefore, was great when two or three men came tumbling into his door without any warning, and all at once. "Warwick, here's the Morton carriage!" they cried, excitedly. "What the deuce does it mean? Can Mrs.—Mrs. Gordon be coming here to see you?"

"The Morton carriage!" repeated Mr. Warwick, startled, despite himself. "I don't know, I have no idea what it means," he added. "Are you sure it is coming here?"

Before the others could reply, the carriage drew up before the curbstone; and, the next moment, a half-grown negro boy appeared at the office door, cap in hand.

"Mr. Warruck, mistiss says she would like fur to see you on pa'tic'lar business, sir, if you is at leisure. If you ain't, she say she will come back when you is."

"Where is your mistress?" asked Mr. Warwick.

"In the carriage, sir."

"Tell her I will be there in a minute." He turned to his client, who was listening with open eyes and mouth. "Mr. Sloan, I am sure you will excuse me for deferring this business at present. Mrs. Gordon has come in from the country, and I can't put her off. Just leave the deed, and I will look over it, and you can call to-morrow."

Mr. Sloan was burning with curiosity, but the lawyer's quiet manner left him no room for appeal. He put down the deed, and made his exit, followed by the smokers. "Warwick won't want us, either," they said, and filed off without waiting for a hint to that effect. No sooner was the coast clear, than Mr. Warwick, who certainly would not have hesitated to say that he did not want them, went out to the carriage and opened the door.

"How are you, Mrs. Gordon?" he said, courteously, shaking hands with the black-draped and closely-veiled figure inside. "I am quite at leisure to attend to your commands. Will you come into my office, and let me hear what I can do for you?"

"Are they all gone?" inquired Mrs. Gordon, who had taken an observation through the carriage-window. "I wish to see you alone."

"They are all gone," he answered, extending his hand again, to assist her from the carriage.

She descended rather feebly, as he observed, and, feeling the worse for her unusual exertion, leaned heavily on his arm as they crossed the pavement. When he caught a glimpse of her face, as she put her veil partially aside on entering the office, it looked so pale, that he was afraid she might be about to faint. He placed her in a chair beside the fire, closed the door, and went hastily to a side-table, where he poured out a glass of water, and brought it to her. "Will you let me suggest that you are too much muffled up about the face?" he said. "Permit me—" and he drew the masses of crape back, as she put the water to her lips for a moment. Seeing her countenance thus more distinctly, he was shocked by its appearance, and confirmed in his dread of a fainting-fit. He pulled a small table that was close by, to her elbow, and set the glass of water, which she now gave back to him,

upon it. Then he crossed the room to one of several walnut bookcases that were ranged around the walls, opened a door that revealed to sight three shelves full of respectable-looking volumes bound in calf, while the fourth, and lowest, seemed to be doing duty as a sideboard. From among two or three decanters he selected one, also a wineglass, and returned to Mrs. Gordon's side.

"You look very pale, very ill, I may say," he remarked; "drink this wine. It will do you more good than water."

"Thank you," she said, taking the wineglass which he had just filled. "You are very kind. Yes, I believe I need it."

She drank part of the wine, put the glass on the table, and turned to him. "Sit down," she said, with a slight motion of her hand toward a seat opposite. "I shall not faint, and I have a great deal to say to you."

It was some time before she spoke. Whether it was the memory of the past—of the different manner in which they two had once known each other—or whether it was merely the all-absorbing thought of the threatening present, something overpowered her, and it was some time before she could collect herself sufficiently to break the silence. At last, with an effort, the first words came.

"Mr. Warwick, for a reason that I will tell you presently, I stand in need of the advice of a lawyer. I have come to apply to you for that advice. But, even more than I need a lawyer, I need a friend, and the service that only a friend can render me. I venture, therefore—you may think without any claim—to ask if you remember the old time sufficiently to care to render me this service?"

"Mrs. Gordon must surely have forgotten that she was once Pauline Morton, before she could ask me such a question," said the lawyer, flushing slightly. "There are hereditary claims of friendship between us," he went on, hastily, as he saw an answering flush rise to the pale face opposite him, "and there is, moreover, a particular claim. When I was a struggling boy, your father aided me in a manner I can never forget. What I am to-day, I owe to his generous kindness. I will gladly do any thing in my power to serve his daughter."

Mrs. Gordon understood, as not many people would have done, the delicacy which made him speak thus—which made him allude not to herself, but to her father. Understanding it, she appreciated what she had only felt before, that this man could indeed be trusted, and that he spoke truly when he said that he would do "any thing" to serve her. Instinctively she held out her hand.

"Thank you," she said. "I felt sure that I might rely on you; but I am glad to hear you say that you will help me. Ah, it is a terrible thing to be a woman," said she, looking at him with pathetic eyes. "If I were like you, I should not need help."

"We all need it in some form or other," answered he. "None of us are so strong as to stand quite alone."

"But it is only a woman who is entirely at the mercy of another; who may be crushed in a hundred different ways—each more cruel, more bitter than death. Mr. Warwick, tell me—what power, short of murder, does not the law give a man over his wife?"

"It gives him a great deal," said Mr. Warwick, regarding her keenly, and reading the excitement written on her face. "But what interest has this subject to you? A widow—"

He was stopped by a gesture from her. Suddenly she extended her hand, and taking up the wine, drank it off. Then she put down the glass with a ringing sound, and, leaning forward, looked steadily into his eyes.

"God forgive me!" she said—"God forgive me that I am forced to say it, but He has not been kind enough to set me free. The first thing I have to tell you is that I am no widow. My husband"—the word nearly choked her—"is living."

Mr. Warwick started, but the surprise was not nearly so much of a surprise as might perhaps be imagined. He had suspected something like this before. It is hard to tell what slight circumstances first sowed the seeds of suspicion in his mind, but he had long felt an instinct that Mrs. Gordon's seclusion and impenetrable reticence were not characteristic of a widow, but of a woman who had still something to fear, something to hide from. Then, no one knew the business of the Morton estate as he did, and he had not failed to make his own comments on the fact that, in taking possession of this estate, Mrs. Gordon had absolutely refused to go through any of the usual legal forms. There was no one to contest her claim, she said, and so she quietly assumed her right of control without any sanction from the

law. Over this obstinacy, Mr. Shields shrugged his shoulders. "It's a woman's notion of doing business, Mr. Warwick," he said. But Mr. Warwick himself was of a different mind. He suspected how it was; though the suspicion scarcely took definite form in his brain. He had other and more important things than Mrs. Gordon's private affairs to consider; and notwithstanding the boyish sentiment for which his sister still gave him credit, Mrs. Gordon herself was no more to him than any old friend, liked sincerely—liked with a certain tenderness, perhaps, on account of the past—but making no part of his daily life. And so it was, that he felt very little surprise when she told him that she was not a widow—that her husband was living.

"Do not blame me more than you can help," she went on, as he did not speak. "Do you remember how proud I used to be in the old time? Well, that pride has not quite been crushed out of me. I could not bear to come back here and tell these people what bitter shipwreck had overtaken me! I could not bear to spread before them the history of—of such a life as mine!"

"Why did you come back at all?" said he, hardly knowing what else to say.

"Because it was a place of refuge—and I had no other. Because it was the one place in the world where he was least likely to come—least likely to think of searching for me. When the last awful blow fell," said she, growing fearfully white, "I looked round despairingly and wondered where I could go. Then, like a relief from Heaven came the thought of my father's house. Here I could be safe, here I would be untroubled, here I might live and die unmolested by him. But I have only been at peace a little while. To-day Babette met an agent whom he has sent in search of me."

"An agent?"

"An unscrupulous tool, whom he retains for uses of this kind, named St. John. As soon as he conveys the information of my whereabouts, that man—my husband—will come here. It is not me he wants, it is Felix—but if he takes the child, he must take me too. What I wish to ask you is this"—she rose, and stood before him, with an eager yearning in her eyes—"can he take him from me? Does the law give him that power—here?"

The lawyer's heart was touched with pity for her; but truth was uncompromising, and must be told. "If he can prove that he is his father, it gives him that power anywhere."

The woman—the helpless creature to whom the law gave no power—sank down again into her chair, and covered her face with her hands. When she looked up at last, that face was tense and bloodless.

"Then I must ask that service of which I spoke a short time ago," she said. "Will you take my poor boy, and put him somewhere—away from me—where he will be in safety, and—and cannot be found?"

Mr. Warwick started, and, for a moment, looked more than surprised—in fact, he looked almost aghast. Here was a proposition indeed! that a lawyer who respected the law as the most sacred of earthly obligations, should be instrumental in evading it!—that a man who was full of the dominative opinions of his sex, should lend his aid to a scheme that removed a child from the just control of its father! Pauline Morton certainly stretched the cord of ancient friendship to its utmost tension, when she made such a demand of him.

"Mrs. Gordon," he said, gravely, "I would do any thing to serve you—any thing that was right; but I am not sure this would be right. A father always has a paramount claim to his child."

Instantly all the woman in her blazed out upon him.

"A paramount claim, given by whom?" she demanded. "It is you men that make the laws that grind poor women to the earth—not God, not religion, not any thing that should be respected! It is you who tear the very hearts out of our breasts, and then talk of right and power to do so. Yes, you have a right—the right of the strong to trample the weak! You have a power—the power of the master over the slave! God knows there is no other. But I might have been sure a man would never help me against a man. Therefore, I shall do what must be done, myself—and only ask you not to betray me."

"Stop, Mrs. Gordon," he said, as she rose and moved toward the door. "Stop a moment," he added, following her. "You must not leave me like this. Remember that I have not refused to help you."

I stated a general fact when I said that a father has a paramount claim to his child. It is certainly true, as a general fact; but in particular cases, that claim is sometimes forfeited. If I am to serve you, I must do so with my eyes open—I must know whether the claim has been forfeited in this instance."

"I think I can convince you of that," said she, faintly, as she sat down again. "I am not strong enough for such violent emotion," she went on, panting slightly. "Wait—wait a little, and I will tell you all."

"Take your time," he said, kindly.

"If I do that, I should never speak at all," she answered, hurriedly. "I must do it at once. You heard of my marriage some fifteen years ago, did you not?"

"We heard of it vaguely. You kept up no communication with Lagrange, you know."

"I married a Captain Fraser, an English officer," she went on, apparently unheeding his reply. "I was very much in love with him," she said, with a trembling, scornful smile; "and he—well, he seemed to be in love with me. I was beautiful then, you know, and I had been very much admired. He was highly connected, and he was very handsome—I honestly believe that those were the only reasons I had for liking him. I thought myself able to judge of character, and rank and good looks dazzled me, as they might have dazzled any village school-girl. Well, I married him, and I cannot tell you of the life I led afterward. Look at my face. Every hour of it is written there! Captain Fraser left the army, and we lived on the Continent—there is not a city of Europe that is not full of bitter memories to me. After my mother died, the life grew worse. My husband was dissipated, and recklessly extravagant. My poor brother"—her voice almost choked her—"helped me as much as he could. It was my demands that went to impoverish the estate, and—and I hear that he has all the blame of it. As time went on, and matters grew worse, I would have separated from my husband, if it had not been for Felix. He, who was my youngest child, alone lived, and I could not leave him. It would have been better, perhaps, if I had done so, for"—she stopped here, and something like a ghastly horror came over her face—"for as matters grew no better, as ill-usage increased, my brother at last lost patience. He met us at Baden, where Fraser was at his worst, and—and there was a violent quarrel. I don't know how it was—I have never heard any particulars—but he—my brother—was killed by that man whom the law calls my husband!"

Almost unconsciously, Mr. Warwick uttered an exclamation of horror, but white as was her face, parched as were her lips, she hurried on:

"The next day I was half mad, and I did not know where to turn; but on one thing I was determined—that was, never to see him again. He and this St. John had been obliged to leave Baden, but he sent me word to go to Scotland, where we had been living for some two or three years—I forgot to say that an uncle had died, and left him a large estate, with the condition that he assumed the name of Gordon. Instead of going to Scotland, I came to America. He knows how I always hated the country, and I was sure he would never look for me here—besides he had hardly more than the vaguest idea of where Morton House was situated. I relied on all this, and I thought I might live here, and—and train Felix to be a gentleman. But you see how it has ended! I might have known I could not defy the cunning of these two. It is Felix they want—not me! If they take him, it will be to make him what they are themselves. And sooner than see him that," she cried out, passionately, "I could find the strength to kill him with my own hands!"

Without a word, Warwick rose from his seat, and took two or three turns up and down the room—then suddenly came back and stood before her, looking at her worn, haggard face. "My God!" he said, "what you must have endured! And you went away from us for this?"

"Yes, for this. Don't—don't speak of the old time. I cannot bear it now," she cried out, suddenly.

"No, I will not speak of it," he answered, kindly. "I was only thinking—it seems hard that mistakes should sometimes be punished as bitterly as sins. Well, you were right. I will help you to the very utmost of my power. As long as I can prevent it, the man of whom you speak shall never obtain possession of your son."

"But the law—"

"Such a man as the one you describe is not likely to have recourse

to the law, in the first place—especially in a foreign land. But, if he did, the law could only assign the child to him; it could not find him for him. Get Felix ready for a journey, and I will arrange my plans, meanwhile, and will communicate with you to-morrow at latest. Do not be surprised or unprepared if I call for the child at a very early hour in the morning. That is, if there is need of haste in the matter."

"Yes, yes—there is great need of haste—immediate haste. I do not know how near my husband may be. Probably he is in America."

"This St. John cannot himself molest you?"

"Not unless he were to entice Felix away. The child was always very fond of him—he might do that," said she, suddenly rising, with terror in her eyes. "I must return at once to Morton House. He told Babette that he was coming there. Good Heavens! I don't know what may happen while I am away."

Mr. Warwick did not attempt to detain her. He saw that it would be cruel to do so. Her fears were causeless, for Babette was fully alive to the danger, and St. John could sooner have snatched Felix from the den of a lion than from Morton House, guarded by her, and garrisoned by a troop of servants; but all the same it would have been useless to reason with, and still more useless to detain, a woman whose nerves were strung to the pitch which Mrs. Gordon's now were. He saw this, and opened the office-door. "I will see you to-morrow," he said, and, as he said it, she uttered a sudden, half-stifled cry, and caught his arm—

"There!—there!" she gasped, shrinking back into the room, and pointing eagerly across the street.

His eyes followed the motion of her hand, and he saw a slender, well-dressed man sauntering along. "That is the man?" he asked, though the question was almost unnecessary.

"It is St. John!" cried his companion, with a wild burst of tears. "It is the wretch whom I have not seen since—since—"

He put her gently into a chair, and said in a quiet voice, the very tones of which were reassuring, "Trust to me, and try and compose yourself. If you allow yourself to become unnerved in this manner, you will put yourself entirely at the mercy of this man, if, by any accident, he succeeds in gaining admittance to your presence. And the child—you must think of him. For his sake, endeavor to control yourself."

Without waiting for a reply, he turned and walked to the window, and followed Mr. St. John's retreating figure with his eyes, as far as it could be seen. It was a good thing that Mr. St. John was thinking deeply; or that keen glance might have made itself felt—not comfortably. Few men like to be scrutinized in that searching fashion; and this man especially had good reason for avoiding it. When he finally turned a corner, and was out of sight, Mr. Warwick went back to his companion.

"He is gone," he said, gently. "Let me put you into the carriage now, Mrs. Gordon."

She extended her hand silently, and he conducted her out. After she was in the carriage, and the door had been closed, she leaned forward and spoke. "God bless you!" she said. That was all; but the words, and the sound of the rich, sweet voice that had spoken them, lingered with him long after he went back into his office, and sat down to Mr. Sloan's deed.

[TO BE CONTINUED.]

COLUMBIA COLLEGE.

COLUMBIA COLLEGE, the oldest institution of learning in the city of New York, was founded about the middle of the eighteenth century. In 1746, the Legislature authorized two thousand two hundred and fifty pounds to be raised by lottery toward the founding of a college, and in 1751 three thousand four hundred and forty-four pounds having been raised, that sum was vested in trustees, and in 1754 the college charter was granted. In 1753, the trustees elected Dr. Samuel Johnson, of Stratford, Connecticut, the first president of King's College, as the institution was then called. Soon after the incorporation of the college, Trinity Church presented it with all the land between Barclay and Murray Streets, from Church Street to the North River. Upon this land the erection of a suitable college build-

ing was commenced, and on the 23d of August, 1756, the cornerstone was laid, and in May, 1760, the building was so far advanced that the officers and students began to lodge and mess there. The building which was then erected formed the central portion of the edifice in Park Place, occupied by Columbia College until 1857. Dr. Myles Cooper, who succeeded Dr. Johnson in 1763, gives the following description of the situation at that early day:

"The college is situated on a dry, gravelly soil about one hundred and fifty yards from the banks of the Hudson, which it overlooks; commanding, from the eminence on which it stands, a most extensive and beautiful prospect of the opposite shore and country of New Jersey, the city and island of New York, Long Island, Staten Island, New York Bay and its islands, the Narrows forming the mouth of the harbor, etc., and being wholly uncumbered by any adjacent buildings, and admitting the purest circulation of air from the river and every other quarter, has the benefit of as agreeable and healthy situation as can possibly be conceived."

The building had a cupola surmounted by an iron crown, in honor of King George II., after whom the college was named. This crown was, at the time of the Revolution, sawed off and placed in the college library, where it is still preserved. We give an illustration which represents King's College as it stood just before the Revolution. It is copied from an old engraving in the college library. In those days the discipline was very strict, and great attention was paid to all points of etiquette. Among the old statutes we find the following: "If any student shall pass a professor without lifting his hat, he shall be fined two shillings."

The college remained unchanged until the time of the Revolutionary War, when its exercises were necessarily suspended. The president, Dr. Cooper, was a Tory, and distinguished himself in many of the political contests of the day. Among his opponents was Alexander Hamilton, whom Columbia is proud to reckon among her *alumni*, though, owing to the troublous times in which he entered her walls, he was not enabled to complete his academic course. Dr. Cooper, having become very obnoxious on account of his political principles, was obliged to leave this country and flee to England, and the Rev. Benjamin Moore, afterward Bishop of New York, succeeded him as temporary president. But this office in a few months was rendered a sinecure in consequence of the college being converted, in May, 1776, into a military hospital. Most of the apparatus and books disappeared, but some seven hundred volumes, after having for many years been considered as lost with the rest, were found in a room leading off from one of the galleries of St. Paul's Chapel. The college library contained at the time of this dispersion many valuable works. All the governors of the province had made donations to it. And these, together with the gifts of Dr. Bristowe and the Earl of Bute, and a copy of each of the books issued from the University Press at Oxford, had laid the foundations of a very fine and extensive library.

After the close of the war, an act was passed, in 1784, changing the corporate name of the college, and placing the institution under the control of a body of officers styled the Regents of the University. Governor Clinton, as governor of the State, became, *ex officio*, the first chancellor. De Witt Clinton, afterward so celebrated in the history of this State as the projector of its great system of canals, was the first student of the new university. But the plan of a university not being successful, three years afterward the college was restored to its original condition, the name, however, being changed from King's to Columbia. The Board of Regents was continued, but after this time they had general supervision of all the educational institutions of the State. Dr. William Samuel Johnson, a son of the first president, was, by a singular coincidence, made the first president of the college under its amended charter. Dr. Johnson was succeeded in 1801 by Dr. Wharton, who, after a few months, resigned the position, and Bishop Benjamin Moore was appointed president. He had been the temporary president through the war. Under his charge the building was altered somewhat and enlarged. Mr. Harris succeeded him in 1811. During his presidency, in 1816, the grant of the botanical garden of the late Dr. Hosack was made to the college, with the condition that it should be removed there within twelve years. But, some five years afterward, this condition was rescinded. This piece of ground consisted of about twenty acres, situated between Fifth and Sixth Avenues and Forty-seventh and Fifty-first Streets. It was laid out by the late Dr. David Hosack, and called the Elgin Botanic Garden. Here were gathered plants from all parts of the world, either exposed

to their native elements, or protected in suitable conservatories. It was the only collection of the kind in the country, and consequently excited a very great interest among scientific men. Here Dr. Hosack, as Professor of Botany in Columbia College, delivered his lectures. The doctor was a very genial as well as a very learned man, and it was always his custom to terminate his course with a strawberry festival, saying: "We are practical, as well as theoretical, the fragaria is a most appropriate element; Linnaeus cured his gout and protracted his life by strawberries." Dr. Hosack, after he was obliged to discontinue this garden, gave it to the State, by which, as we have already related, it was presented to the college. It now forms by far the most valuable portion of their property, and for the most part is already covered with magnificent mansions. What was then three miles out of town, and worth only two hundred and fifty dollars an acre, is now almost in the heart of the city, and worth millions. In Dr. Harris's presidency the buildings were very much altered, two wings for professors' houses were erected, and a new library and chapel. Soon after Dr. Harris's resignation, which occurred in 1829, that learned jurist, the Hon. William A. Duer, was appointed to succeed him. During his administration, many important changes were

made, but the project, though it met with the general approbation of the learned and scientific men of the city, never seemed to be received with the same favor by the general public. The lectures were very poorly attended, so that, after a few months, the trustees were compelled to discontinue them. Marsh's lectures on the English language, which are now published in book form, were originally delivered in this course.

In 1858 a law department was created, under the name of Columbia Law School, and a building was procured for it in Lafayette Place, opposite the Astor Library. This school has been unusually successful; after an existence of only twelve years, it has upon its rolls nearly twice as many students as the Harvard Law School. Here, besides the ordinary courses of lectures, occasional courses are delivered on special subjects by some of the first jurists of the country. It already has a fine library, including the entire collection of the late Chancellor Kent, with many other valuable works.

Two years later an arrangement was entered into by which the College of Physicians and Surgeons became the Medical Department of Columbia College. At the time of the establishment of this institution, forty-seven years before, the then medical school of the col-

COLUMBIA COLLEGE.—THE PRESENT BUILDINGS.

made in the course of study, and a new course was established, open to all who chose to attend, called the Scientific and Literary. Dr. Duer retained this position for about thirteen years, when he was succeeded by Dr. N. F. Moore, who, in turn, in 1849, was succeeded by the late Charles King. Soon after his election, the trustees began to consider seriously what should be done with their Botanic-Garden property. Though it had now grown to be quite valuable, it had not hitherto been made available, and had been a burden instead of a source of income to the college. It was finally decided to lease it, and it was soon after broken up into lots. This action gave a new impulse to the subject of removal, which had been long talked of, and was soon after rendered necessary by the proposed extension of Park Place through the college grounds. A number of sites were considered, but finally that now occupied by the college, on Forty-ninth Street and Fourth Avenue, was selected as being at once accessible and somewhat retired. The buildings were those formerly used by the State Institution for Deaf Mutes. They are not very handsome, but they are substantial, and on the whole well adapted for the purpose. Since then two other buildings have been erected, one for a laboratory for the newly-established School of Mines, and the other a house for the president. After the removal of the college to the new site, the trustees attempted to carry out the plan of a post-gradu-

ate course, but the project, though it met with the general approbation of the learned and scientific men of the city, never seemed to be received with the same favor by the general public. The lectures were very poorly attended, so that, after a few months, the trustees were compelled to discontinue them. Marsh's lectures on the English language, which are now published in book form, were originally delivered in this course.

In 1858 a law department was created, under the name of Columbia Law School, and a building was procured for it in Lafayette Place, opposite the Astor Library. It already has a fine library, including the entire collection of the late Chancellor Kent, with many other valuable works.

Two years later an arrangement was entered into by which the College of Physicians and Surgeons became the Medical Department of Columbia College. At the time of the establishment of this institution, forty-seven years before, the then medical school of the col-

gineering. This could very easily be done by the appointment of one or two additional professors, as much of the ground now travelled over is common to the two subjects. The faculty of this school now num-

of different minerals, and is constantly receiving accessions from all parts of the world. Adjoining the Museum, in the building on Fourth Avenue, is the paleontological collection of Dr. John S. Newberry.

COLUMBIA COLLEGE AS IT WAS IN 1840.

ber fifteen professors and assistants, forming the largest and most complete scientific faculty in the country. The buildings are within the college grounds, and, though not remarkable for elegance, contain a great deal of room, and seem to answer their purposes very well.

This remarkable collection, whose value is estimated at over forty thousand dollars, is considered by scientific men to be one of the most complete geological museums in the world.

Passing from the buildings of the School of Mines, we first come

OLD KING'S COLLEGE.

In the upper story of the building, on Fiftieth Street, is the Museum of the School of Mines. This, considering the short time it has been established, is a fine collection. It consists chiefly of specimens

to the college library and chapel. These are both located in the same building, the chapel being in the first story, and the library in the second. The chapel is very plain. Benches are arranged along the

walls for the students, and the professors sit upon a raised platform in the front; the chaplain occupies a small pulpit against the wall, and before this is the president's chair, which is the same chair in which Franklin presided at the meetings of the Institute in Philadelphia. Over the chapel is the library, which, though it is not very large, is a choice collection of books. Upon the shelves are many rare and valuable works, and, hanging upon the walls, are portraits of the old college presidents and many of the more distinguished professors.

Leaving the library, and turning to the right, we come to the main college building, in which are situated all the lecture-rooms. Ascending the staircase on the side of the building toward the library, the first room we come to was occupied by the late Professor Anthon. The walls of the room are hung with portraits of eminent Greek scholars, such as Porson, Hermann, and others of like character. The doctor was an able and indefatigable instructor, and, though somewhat strict, always endeared himself to his pupils. Dr. Short, the Professor of Latin, now occupies the room.

The next room is the president's. On the same floor are three other lecture-rooms, but, as they have no particular associations connected with them, we will pass them by, and ascend the stairs. Here, at one end of the hall, are the rooms of the Professors of Mathematics and Astronomy, and at the other those of the Professors of Greek and German. Ascending still higher, we come to the lecture-room of the Department of Chemistry. This is somewhat larger than those which we have seen hitherto. The seats rise one above the other, and the room is provided with galleries. All the instruction in this department is given by lectures, illustrated by suitable experiments. On this floor are also the rooms of Dr. Torrey. These contain his immense herbarium, a magnificent collection, which is equalled in size by only one or two in the country. This is the collection from which "The Flora of America" was compiled. Here Dr. Torrey delivers lectures on botany to those of the senior class who choose to attend them.

The only remaining lecture-room is that of the Professor of Physics. This is by far the finest room in the building. It is lighted by windows in the front and rear, and by a dome in the centre of the ceiling. All the instruction here is also by lectures. The apparatus is contained in glass cases, arranged around two sides of the room and the galleries. It is very extensive and very fine, particularly the instruments for polarizing light. Here is the largest Nicol's prism which has yet been constructed, the first Holtz's induction-machine which was ever brought to this country, and many other rare and curious instruments.

We have now completed our survey of the college-buildings, and will conclude with a few words about the government and internal direction of the institution.

The college is under the direction of a Board of twenty-four Trustees, of which the Hon. Hamilton Fish, our present Secretary of State, is the chairman. Four of these are *ex-officio* members, the rector of Trinity Church, the senior minister of the Reformed Dutch Church, the senior minister of the Presbyterian Church, and the president of the college.

The branch schools are managed by a committee of the trustees, with associate members, except the School of Medicine, which has trustees of its own. The whole faculty of the college consists of the president, with seventy-two professors and assistants, of which twenty belong to the School of Letters, or the college proper, and the remaining fifty-two to the associate schools.

The present president is the Rev. Dr. Barnard, who succeeded Dr. King in 1864. He was for many years Chancellor of the University of Mississippi. It was under his direction that the great telescope in the Dearborn Observatory of Chicago was constructed. It was made by Alvan Clark, and was designed originally for the University of Mississippi, but, on the temporary suspension of that institution, it was sold to the Dearborn Observatory. Dr. Barnard is a man of great scientific attainments. Among the faculty also are many distinguished names; as, Dr. Drisler, the editor of the well-known Greek lexicon of Liddell and Scott; Professor Peck, formerly of West Point, and author of many mathematical works; Dr. Short, formerly president of Kenyon College; Professor Rood, who has made many discoveries in Natural Science, especially in relation to the electric spark; Professors Day and Chandler, both well-known chemists; Dr. Willard Parker, the eminent surgeon, and many others.

WILLIAM B. HOOPER.

CONSOLATION.

THERE are once-beloved faces
We gaze on no more,
As we stand in the places
That knew them of yore;
Death came not upon them,
Their smiles still are bright,
But strangers have won them
And live in their light.
Yet age has its wrinkles,
And life has its cares;
And each passing year sprinkles
A few silver hairs:
They must watch the cheek shrivel,
And greet the gray hair;
But to us 'tis unchanging—
For us ever fair.

There are ties that must bind us
Though severed for aye;
There are scar leaves that mind us
Of love's summer day;
There are hopes that still flatter
When Hope long has fled,
Like the flowers that we scatter
With tears o'er the dead.
But dearer, though broken,
Such ties may become,
More sweet than if spoken
Our dead hopes and dumb,
Than the triumph and gloom
Of a fatal success
Which turns into curses
The things that should bless.

ROSSITER JOHNSON.

TEN SIEGES OF PARIS.

THERE is no capital which has so often provoked and undergone attack. The first mention of Paris in history records an investment. Fifty years before Christ, it was the stronghold of the Gauls. Labienus, the most able of Cæsar's generals, in that year marched an army against the rebellious place, and, after crossing the Seine, forced the insurgents to evacuate it. Before retreating, Vercingetorix, the chief of the Gauls, burned what there was of a city. But the site was too eligible not to invite the building of a new town. Like Berlin, Paris originally was confined to an island formed by a river, and surrounded by inaccessible swamps. No sooner had the Germans conquered France, than Chlodwig, the leader of the invading tribe, reconstructed ancient Lutetia, and made it the centre of the new empire. During the time his descendants held sway in France, it remained their principal fortress. When their authority began to decline, the defence of Paris against a foreign enemy gave such *prestige* to one of their generals as to enable him to usurp the throne of the decaying dynasty. Before this, however, Charles le Gros, a degenerate scion of Charlemagne, had found himself attacked at Paris by the Normans. A helpless imbecile, he had no choice but to make his peace with the predatory bands, no matter at what cost. On the occasion of a second raid, however, Paris gallantly held out for a whole year, under the command of Count Otto, one of the king's nobles. So great was the renown Otto acquired by this feat of arms, that, on Charles's death, in 888, the Frankish nobility elected him their king. A nephew of this Otto was Hugh Capet, the ancestor of the Bourbons.

In the mean time, the German conquerors of France, comparatively few in number, had become absorbed by the subject nationality, and every now and then had a brush with the old country whence they had proceeded. In 978, when the German Emperor, Otto II., was celebrating the Festival of St. John, at Aix-la-Chapelle, he was surprised by King Lothaire, of France, at the head of an army of thirty thousand men. The German Emperor returned the compliment, and, having

crossed the frontier on the 1st day of October, marched straight upon Paris, overcoming all resistance in his way. Before winter set in he stood at the foot of Montmartre, and invested the city. Very much like the Moltke of our day, he had to detail a portion of his army to ward off the hosts attempting the rescue of the beleaguered place; but, unlike the result in the present instance, he was obliged to withdraw without effecting his object. Winter and disease decimating his troops, he eventually returned the way by which he came. There is an old story that, before leaving, the Germans assembled on Montmartre and sang a *Te Deum* with so vast an energy of lungs, that all Paris echoed the sound. Why they should have offered up their thanks in this boisterous manner, when foiled in their efforts, is a riddle unsolved to this day.

The strength of the place having thus been proved by experience, King Philip Augustus, at the beginning of the thirteenth century, extended its fortifications, adding several hundred towers to the walls. King Charles V., in the latter part of the fourteenth century, surrounded the new suburbs with a fresh *enceinte*, built a citadel called the Bastille, and constructed a fort on the isle of St. Louis. Notwithstanding these new defences, the English took Paris, after the battle of Agincourt, in 1420. The Maid of Orleans, attempting to recapture Paris, 1429, was repulsed by the English, who, however, seven years later, were obliged to march out, owing to the gallantry of Dunois, le Bâtard Royal.

King Henry IV. was the next to assail the devoted capital. As he was a Protestant, it would not recognize his authority. Having defeated the Catholic League at Ivry, March 17, 1590, he approached Paris in forced marches, and, occupying Corbeil, Lagny, and Creil, cut off provisions, then chiefly received by the river. He next planted his guns on Montmartre, and, from this dominant position, left the Parisians—his naughty children, as he jokingly called them—to choose between bread and bombs. Not less obstinate than they are now, fifteen thousand of the inhabitants died of hunger before the town opened negotiations with the king. Just in the nick of time, however, the Spaniards, who assisted the Catholic League, sent General Farnese with a large army from Belgium to the rescue. Henry was compelled to raise the siege, and only entered Paris four years later, when he had embraced Roman Catholicism, and then he was welcomed with the greatest enthusiasm.

France now rapidly increasing in power, Paris remained more than two hundred years unvisited by an invading army. In the reign of Louis XIV., the mere idea of the foreigner venturing into the heart of France had come to appear so preposterous as to lead to the razing of the old fortifications. Louis XV. in 1726 again encircled the city with a wall, which, however, was not intended to serve a military purpose. As an open town, Paris underwent the storms of the Revolution. When, in 1814, the allied armies arrived in front of it to avenge the deeds of Napoleon I., a few redoubts, hastily thrown up, were all the impediments in their way. Twenty-five thousand regulars, under Marmont and Mortier, and fifteen thousand National Guards, with one hundred and fifty guns, held the place for a day against forty thousand Prussians and Russians. When Montmartre had been taken by storm, and the Cossacks and Uhlans were swarming in La Chapelle and La Villette, the proud capital surrendered. On March 31st, Frederick William III. of Prussia, the father of William I. of the present day, and Alexander I. of Russia, made their entry into the city.

The following year witnessed the repetition of the feat. On July 2, 1815, the Prussians, under Blücher, took Montrouge and Issy by storm, while Wellington forced his way into the northern and eastern suburbs. On the 7th of July the English and Prussian Guards once more trod the Boulevards.

Such is a brief summary of the history of successive sieges of Paris before the memorable investment of the year 1870.

lina, dividing that State from Tennessee. The range is there called the Unaka or Smoky Mountains. The Blue Ridge proper continues on its southward course until it strikes the South Carolina line; there it turns almost directly westward, and meets the other range. The section of country between these two ranges of mountains has a sort of egg-shape—flattened a little on one side of the broad end. Across this section, and generally at right angles to the main ridge, run other ranges of mountains, between which are found streams of crystal water, with numerous beautiful and sublime cascades, cañons almost as grand and far less known than those of the Sierra Nevada, fertile valleys, and flourishing villages. These streams all rise in or near the Blue Ridge, and flow through the Unaka Mountains. The lowest point of the Blue Ridge is about two thousand eight hundred feet above the sea-level, while the highest is about six thousand; in the intermediate land the lowest land surface is about fifteen hundred, and the highest six thousand seven hundred and eleven feet above the sea-level.

Hence we have here a character of valley protected on all sides by mountains. The tops of the highest of these mountains are covered with balsam-trees, which extend down the sides to a certain limit. The geographical centre of this region is near the town of Asheville; and Nature has also made it the topographical centre, as the streams and mountains of a large portion of this region converge at that place. In latitude it is about thirty-five degrees, in longitude about eighty-two. The town is located on a hill above the French Broad River, and is, at its highest point, two thousand two hundred and twelve feet above the sea-level. Thus located its mean of summer temperature in 1870, by data gathered from the meteorological reports of the Government Agricultural Department, was less than that of Oswego, New York, eight degrees farther north; while on the same parallel two hundred and fifty miles east, the mean was twelve degrees higher.

In summer the winds prevail from the southern points of the compass; they come to Asheville cooled by passage over the high mountains, and slightly tintured with the balsamic odors gathered therefrom. In winter, as they come from the northern points, their force is broken by the mountains on that side, and in descending to the valley meet the milder temperature there generated. Then, in the spring, that trying time for consumptives, these winds are the more specially laden with the soothing balsam odor from the bursting buds and "blisters;" indistinguishable it may be, but it has its influence in giving that astonishing property to these winds, so often noted by sufferers, of being pleasant rather than irritating. Standing in the town of Asheville, one may look far west and see the black tops of the Balsam Mountains; north, the still higher peaks of the Roan and its kindred range; while east and north the towering peak of Mount Mitchell and its seven brothers give thousands of acres of surface to the balsam-tree—forming thus a perfect cordon of this growth.

We have stated that the soil of this region is singularly fertile. This is due in the valleys to the wash from the mountains, but many of the mountains of this interior basin present the strange anomaly of being fertile to their very tops. It is a singular fact respecting this country that the sharp-peaked mountains are all poor land, while those which are rounded, and come up rather rolling and gently, are almost invariably rich. There are no lakes in this region, and yet, from the peculiar formation of certain sections, it would seem that there once had been. The soil is generally a decomposition of granite, gneiss, and limestone. It is rich in potash, and contains undissolved particles of mica; its color is dark, and to the touch has a soapy feel. The tree growth is chestnut, oaks, hickory, black and white walnuts, cucumber-tree, ash, linden, and sugar-maple. Dr. Curtis, a distinguished geologist, once said that he found every shrub and flower near Niagara Falls duplicated in Buncombe County, North Carolina.

It has been but a few years since this region was in the possession of the Cherokee Indians, and even yet a respectable remnant of the tribe reside seventy miles west of Asheville. As may be well inferred, much of this land is yet in its native wildness. It is cheap in price, inviting the sturdy settler by its fertile soil and luxuriant tree-growth, while the elastic and invigorating climate offers extraordinary inducements to the invalid. We have presented in the JOURNAL, at different times, various illustrations of this beautiful and yet little known region. The view of the French Broad River, given in this number, will for the present close our series of North Carolina scenes.

WESTERN NORTH CAROLINA.

WITH AN ILLUSTRATION BY HARRY FENN.

A PECULIARITY of Western North Carolina is the union of a rich soil with a healthful climate. This is due to topographical and geological causes. Let any one take a map and examine this extreme western part of North Carolina. It will be found that near Christiansburg, in Virginia, a spur of the Blue Ridge strikes off to the southwest. This spur forms the western boundary of North Caro-

PICTURESQUE AMERICA.—ON THE FRENCH BROAD, NORTH CAROLINA.

THE RETREAT.

HERE let us couch in fern,
And gaze adown the forest's dim arcade,
Where little patches of bright sunlight burn,
Companioned of deep shade.

Hark! in the oak o'erhead
The cry of the young ravens, hunger-vexed;
See, too, faint-scented lilies, richly fed,
Hint at the sweet old text.

How hushed the spot and still,
Save for a rustling squirrel frolicsome,
Or from a bird's heart leaps a silver trill,
Too happy to be dumb!

How the green lizards glide
Where, on that broken bank, the sunbeams
sleep!
What beetles, by gemmed corselets glorified,
Among the grasses creep!

Note in yon patch of blue,
Far overhead the lacing boughs among—
His wings a bell, ringed where the light comes
through—
A hawk at hover hung!

Hush! not a stir—no word!
Here come the rabbits flitting through the
bent;
And, quick! a rail—see there! Ah, timid
bird,
The grass nods where it went!

And lo, the forest-king
Down yonder avenue, with wide-branched
brow,
Treads proudly! No alarms the breezes bring
To scare his big heart now!

Dragon-flies dart and poise
Above the pool that sleeps beneath the reeds;
All Nature's creatures drink that fount of joys,
Which from mere life proceeds.

How it all teems with life!
See here, this earth I scoop up in my hand,
With little busy workers how 'tis rife,
Whose lives by days are spanned!

Drops from the mighty sea—
The Far Existence—whence is drawn the
store,
That swells the full-pulsed veins of you and
me—
The same, nor less nor more.

Sharing His breath, you mark,
With us at the Creation's dawning dim:
What is man's right to quench the tiniest spark
That took its light from Him?

Come, friend, thank God with me
That we can lie within this woodland still,
And watch His works, how manifold they be—
With no desire to kill!

THE MAGIC WAND.

"Without water no life."—O'Kra.

THE words of the old naturalist are no exaggeration—where there is no water there is no life. It fills the veins of our great mother, Nature, and there is no plant and no living being that can exist a moment without the needful supply. More than two-thirds of man's structure, fearfully and wonderfully made, consists of water; and, if a vegetable star-jelly, or a medusa, be dried, there remains barely enough to attest its former existence. Mosses and algæ, with the great host of infusoria, suspend their existence when water is no more at hand, and, with the first tiny rain-drop, they revive and resume their joyous existence.

Hence the universal worship of the beneficent element and its all-importance in every myth and every faith. All things, taught Thales of Miletus, have been born of water; and the spirit of the Almighty "moved upon the face of the waters." The gods of India are floating meditatively upon the leaves of gigantic water-roses, and the goddess of beauty arose in matchless perfection from the waves of the ocean. Even the Church sanctifies the pure element as the emblem of spiritual regeneration.

It is not strange, therefore, that from time immemorial pure water should have been sought for with eagerness, and that, hence, springs were worshipped and honored far above lakes or rivers. There was no sacred fane known to the ancients, which lacked the symbolic spring by its side, and, even where the pure fountain arose in capricious wilfulness from the briny deep, the precious gift was duly appreciated. The ruins of a temple built over such a spring bubbling up from the Mediterranean, still are seen near Corinth, and midway in the Rhine stands to this day a Roman structure protecting a similar spring. The river-god ever dwelt at the place where it gushed forth from the bosom of the earth, and thence it poured down its rich blessings, making all the lands it touched with its life-giving waters to bloom and bear in abundance. Dragons and sacred serpents watched over the purity of favored springs that brought health and life to suffering men, and the "still waters" of German races, drawn secretly at Easter and Christmas for mysterious purposes, were ever obtained from springs alone. No wonder, then, that a great poet should have loved to dwell by the side of that most famous of all springs, which, born far beneath the mountain-side, bursts forth all of a sudden into a cascade, and, filling a vast basin with its stormy flood, foams at once a mighty stream into the rich plain beneath.

Great is the love of the favored children of our earth, to whom water is given in abundance; but greater far the gratitude of those who, in the midst of Nature's richest gifts, in the tropics or surrounded by fearful deserts, are left for months without the refreshing element. Who can describe the delight with which, in equatorial lands, the first drops of the early rains are hailed by men, who have for months been compelled to live upon the repulsive water of pools and morasses? And what can equal the almost delirious joy with which the wanderer in the Sahara, after days of cruel suffering, rushes up to the precious spring and cools the parched, shrivelled palate with the ineffably sweet, cool fluid? Well says the Arab in his proverb, therefore: "All the treasures of the earth are not equal to a drop of water!"

Fortunately, lands without water are rare on this beautiful earth, and, even where apparently the want is greatest, help is easy and ready at hand. "There is an ocean beneath our feet," had the Touariks of Africa said with instinctive truth for many a generation; and no sooner had the French in Algeria reached the Sahara, than they began sinking artesian wells, and the desert now literally blooms forth as the rose. The Great American Desert on our maps will, in like manner, soon become a misnomer, as by similar means water is brought to light everywhere, and rich crops are raised where a few years ago sterile plains and alum-fields spoke of nothing but solitude and starvation.

But even more favored regions are rarely content with Nature's supply, and long for a greater abundance of the precious elements. In days of old, when science was but an infant, and instinct had to take the place of knowledge, the gods alone were deemed powerful enough to allure the hidden spring from its dark home to the bright light above. But why in all cases gods and men alike should have accom-

plished the miracle by the aid of a rod has never yet been ascertained. Yet such is the fact, from the days of ancient Greece to our own. When new-born Zeus had no water for his first bath, Rhea struck the Arcadian Mountain with her staff, and an ample spring burst forth at her commands. At another time Bacchus knocks his thyrsus against the earth, and water gushes out at once; Poseidon, to gratify the fair daughter of Danaos, whom he loved tenderly, hurled his trident down, and the triple Lernaean spring refreshed the parched lands of Argos. In Eastern Persia the great Jenyeed cleft the earth with his golden sword to conjure up a living spring; and Balder, the white god of Scandinavia, saved in the same manner his despairing army from a miserable death by calling forth a spring during the very heat of the battle.

Godlike heroes and priests, favored with powers from on high, repeated these miracles. Moses struck the rocky sides of Sinai with his rod and "water came out of it;" and the Catholic Church has numerous legends of like character, from the well even now seen in the ruins of the Mamertine prison, which furnished St. Peter miraculously the water for the baptism of his keeper and his companions, to the Spanish saint of a few years ago, who pushed a branch of a tree into the parched ground, and saw living waters gush forth from the hole.

There can be no doubt, therefore, that, from of old, men must have known how to discover hidden waters. Moses, no doubt, learned the art with all the wisdom of the Egyptians which he acquired; and from the same source the Greeks obtained it, for Danaos, who opened fifty springs in thirsty Argos, and was hence called the Giver of Water, came from Egypt. But, of all nations on earth, the Etruscans were beyond comparison the masters of this mysterious art. They had special spring-finders (*aquilegi*) who enjoyed many privileges and were highly esteemed; the few references made by ancient writers to their manner of proceeding seem to indicate that they possessed a surprising knowledge of geology, and hid under mystic forms a truly scientific method. Their art, however, was early lost, and already in the days of Cassiodorus African masters were sent for, to find springs in the suburbs of Rome; but they judged only, as our Indians do to this day, from the appearance of the surface, the abundance of certain plants, the absence of dew, or the early melting of snow.

About a thousand years ago, however, the rod, as a magic wand, began once more to play a prominent part in the search after water. It was commonly a forked branch, cut with certain solemn ceremonies from a hazel-bush; the two ends were seized by the hands of the gifted owner, holding the rod on a level with the ground, as high as the breast, and wherever precious metals or pure water were hidden underground, there the rod would bend and twist, and, if resisted, even break off short. From the fourteenth century to our own this divining-rod has enjoyed the reputation of being a sure means of discovering water, and there is no denying that large numbers of men, in all countries of the earth, who have used the rod, have found springs where they were before neither known nor suspected. The question, however, remains open whether their physical organization was not such as to enable them to accomplish the same end without the rod. For it is certain that now and then men are peculiarly endowed by Nature with a power to feel the presence of water. Bleton, a native of Dauphiné, and a simple shepherd, noticed that he always felt sick when seated upon a large stone, and even when coming near it. The stone was moved to another place, and, behold, the attack ceased, but returned as soon as he approached the place where it had been lying. Some *sourciers*, as the men of the rod are called in Southern France, heard of it, dug there, and discovered a powerful spring. Thereupon Bleton travelled through his native province and the adjoining regions in search of water; whenever he came near a subterranean supply, he felt an oppression near the heart, which was followed by violent tremblings; his legs shook, his hands sunk down helpless, the pulse slackened, and frequently he fainted away. Nevertheless he employed the divining-rod, and during his lifetime even the great masters of science, who took a deep interest in his case, were doubtful as to the power of the magic wand.

A far more remarkable case, however, which forever ended the prestige of the divining-rod, was that of Paramelle, a French priest of Southern France, who added to a peculiar natural gift profound study and extensive research. His fame soon spread far and near, the government prevailed upon him to abandon his sacred office and to become a national benefactor. For more than thirty years this re-

markable man travelled through France, Belgium, and Germany, received everywhere with enthusiasm, and now looked upon by the ignorant with awe as a magician, and now worshipped by the superstitious as a saint. He went on horseback, dressed in the simple garb of his profession, examining the soil, studying the landscape, and then, with unerring accuracy, pointing out the place where springs, water-courses, and subterranean lakes, would be found. Over ten thousand springs were thus opened, furnishing suffering provinces an ample supply, and bestowing rich blessings upon a great kingdom.

While the simple, benevolent priest never used the rod nor accepted a reward, we learn that in our enlightened country the magic wand and its mysticisms are coming to honor once more. Of the ten or twelve thousand oil-wells bored in Pennsylvania, we are told that one thousand at least were located by diviners with a divining-rod, or with a pendulum made of a deerskin bag enclosing a ball of musk, or by spiritualists falling into trances and executing spasmodic evolutions when they felt the influence of the spots to be selected! Surely, when we hear such accounts, when we read of the divining-needle used by Tartars, pointing to cabalistic signs and thus foretelling the future, and compare this with our planchette, and when the witchcraft of Hebrew days is found to have foreshadowed in every feature the exploits of modern rappers—we may well doubt the superiority of our civilization.

SCHELE DE VERE.

IN A BURMESE PRISON.

NEARLY fifty years ago an Englishman named Gouger visited Burmah, then almost unknown to the outside world, for the purpose of regaining his health, which had been undermined by a residence in Bengal. With a view of making money by the expedition, he took with him a stock of Manchester and Birmingham cotton-goods, which he succeeded in selling to the Burmese at an enormous profit. Returning to Calcutta, he invested the proceeds in a mixed cargo, with which he again sailed for Burmah. Here he was successful, both in business and social relations, receiving many attentions from the king and dignitaries of his court, and amassing great wealth by the sale of his wares.

After remaining several months in Ava he was alarmed by news of threatened hostilities between the British and Burmese Governments. The latter, being wholly ignorant of the resources of their opponent, were eager to go to war on a slight pretext, as they thought it would be easy to capture Calcutta and obtain possession of other ports of Bengal. Gouger vainly attempted to convince them of the folly of this course. The favor with which he had been regarded soon changed to hatred. He was charged with being a spy of the British Government, and the fact that he had made sketches of buildings and scenes near Ava was, with other suspicious circumstances, the cause of his arrest and of a long and terrible captivity.

At first he was placed in some old sheds used as barracks in the palace-yard of the king, and guarded by royal sentinels. Among other reports circulated to his prejudice, it was said that he was brother-in-law to the East-India Company, that august personage, as the ignorant Burmese regarded him, having married his sister. After ten days' confinement in the bamboo sheds he was startled by the entrance of a gang of ruffians with cords and long canes in their hands, whose appearance indicated some evil intent. Between these men and the guards a fight took place for the trifling articles of furniture in the room. They then stripped him of part of his clothing, saying, by way of consolation, as jacket and trousers were torn off, "they will be of no use to you, for you are to be carried to the *Let-ma-yoon toun*" (the death-prison). Of the four common prisons in Ava this was the one appropriated to criminals who would probably be condemned to die. Its name in the Burmese language, signifying the extreme of human suffering, aptly symbolized the cruel treatment inflicted on its inmates. This den was guarded by seven or eight condemned malefactors, whose lives had been spared on the condition of their becoming common executioners. The more infamous the criminal, the better fitted he was judged to be for his revolting duties.

To prevent the escape of these wretches by making detection an easy matter, a circular mark was indelibly tattooed on each cheek.

From this brand they were called *pah-quet*, or ring-checked. Such was their detestation of this name that none of the prisoners ever dared by using it to remind them of the execration in which they were held. The nature of their qualifications for their employment was stamped upon their breasts. In order to curry favor with the chief of these miscreants, the prisoners, as well as his subordinates, addressed him as *aphe*, or father. He was a lean, hard-featured old man, whose qualification for his office was indicated by the word *loo-that*, or murderer, tattooed upon his skin. The motto borne by another stamped him as a fratricide. A third was branded *thoo-kho*, or thief, and a fourth *myeng-kho*, horse-stealer. These men were forbidden by law to enter any house except in execution of their office.

In a room about forty feet long by thirty wide, low-studded, and without any window or aperture to admit light or air except a closely-woven bamboo wicket used as a door and always kept closed, Gouger and his companions were confined. They only escaped death by suffocation by breathing the little air which found its way through chinks between the teak-boards composing the badly-constructed walls, or which entered through a hole near the roof of the building, where some decayed plank had been torn off. Among the few articles of furniture in the room was a gigantic row of stocks similar to those formerly used in England, and capable of confining more than a dozen persons. It was compared to a huge alligator that opened and shut its jaws with a loud snap upon its prey. There were also smaller articles of the same kind, though of ruder construction, and even more uncomfortable.

But the most deceptive piece of furniture in the room was a long bamboo suspended from the roof by a rope at each end, and easily raised or lowered by means of pulleys. This affair, which looked something like a swing, was really an instrument of torture. Its simplicity of appearance conveyed no idea of the suffering it was capable of causing. At night it was let down, so that the bamboo could be passed between the legs of the prisoners. After these were fastened to it, it was raised to such a height as to inflict great pain on the prisoners without endangering their lives. Its victims, like those who were confined in the stocks, had their heads and shoulders stretched upon the ground, and in this painful position could obtain only broken and unrefreshing sleep.

There were some forty or fifty prisoners lying on the floor of this room when Gouger entered it, all of them nearly naked, and very few without chains. Their emaciated frames and woe-begone countenances told the story of their wretchedness better than words, and their stolid, silent indifference was more expressive than complaints or groans. It was the silence of hopelessness, the apathy of despair. The condition of the prison can be judged from the fact that it was never washed or even swept. The garbage which had accumulated here offended all the senses. It reeked and even moved with putridity. Among the prisoners was Dr. Judson, the American missionary, an account of whose arrest and incarceration has been given in his wife's letters. The numbness and stiffness of the limbs caused by these nights of torture by the bamboo was partially relieved in the morning by lowering the instrument to within a foot of the ground, thus permitting the blood to circulate more freely. At eight o'clock the prisoners were driven out in gangs of ten or twelve to take the air, five minutes only being allowed for this purpose. Even fresh air, which is elsewhere freely granted to the vilest malefactors, was denied to the inmates of the *Let-ma-yoon*. Gouger was more fortunate than most of the prisoners in receiving a daily supply of food. This was brought by one of his servants to the outside gate, where, after being examined by the officers, it was handed to him by one of the ringed-men. Had it not been for this circumstance he would have been almost starved. As no provisions were furnished by the Burmese authorities to the prisoners, they were almost wholly dependent upon the kind offices of their relatives or friends at large. Even the charity of the natives, which was manifested by occasionally sending to the captives large baskets of rice, was too limited to afford sufficient nourishment. These supplies furnished a single hearty meal to every prisoner, but, as a week or two would often pass before they were renewed, the prisoners had to depend in the mean time on the kindness of such of the inmates as could spare a trifle from their own scanty store. Thus the famished appearance of many of these poor creatures was easily accounted for. When a person was imprisoned for treason or any other crime against the state, many of the most charitably-

disposed natives were afraid to supply him with food lest it should subject them to punishment for sympathizing with the offender. In one case, where a noted Burmese general was sent to prison, he would have starved, had not the British envoy daily supplied him with boiled rice. No other person dared to do it.

Sometimes the *myo-serai*, the assistant to the governor of the city, visited the prison to superintend the punishment of some unfortunate culprit. The victim's denial of guilt being attributed to obstinacy, torture was used to overcome it. In one of these cases a young man was charged with being concerned in a robbery. Although appearances were in his favor, torture was resorted to, to extort from him a confession of guilt. He was forced to sit on a low stool, his legs being bound together by a cord above the knees. Two poles were then inserted between them by the executioners, each of whom took hold of a pole, one end being placed upon the ground, and moved it in all directions, so as to force the limbs asunder. Such was the prisoner's agony that he fainted. After being restored to consciousness by cold-water applications and vigorous rubbing, he was thrown into prison and threatened with fresh inflictions on the morrow, as no confession had been wrung from him. On the next day another kind of torture was resorted to by the *myo-serai*. The victim's arms were first tied together at the wrists behind his back with a stout rope, which was then raised by means of a pulley, so as to just allow his toes to touch the ground. He was left in this position till agonizing pain compelled him to make a confession. In this he charged two respectable persons with being his accomplices in the robbery. As the *myo-serai's* object was to obtain money, this was very satisfactory, for he now had two men in his power who were able to pay. After fleecing the new victims, the prisoner was released. He subsequently acknowledged that, to save himself from fresh torture, he had accused innocent people.

Every afternoon, at three o'clock, an ominous sound startled the inmates of the prison. It was the deep tones of the huge gong suspended in the palace-yard, and announced that a prisoner had been selected for execution.

The mystery shrouding the selection of the doomed man made the suspense more terrible. None knew beforehand who was to suffer. The first intimation was given by the opening of the wicket and the appearance of a spotted man, who silently stalked toward his victim and bore him away to execution. For days Gouger waited in fear and trembling lest the executioner should claim him.

At last, however, by means of bribery, Mrs. Judson secured some relief for her husband, and, on her promising that the other white prisoners should pay as much money as they could raise, Gouger and his companions were removed from their filthy quarters to an open shed looking out on the prison-yard. They were overjoyed at the change, not merely on account of the more comfortable accommodations, but because it removed for a time their fears of a speedy execution. In assuming, however, that such favor would not be granted to persons condemned to death they were mistaken, for it was sold to all who could pay for it, the revenue of the jail establishment being kept up in this way. They also found that the alleviation thus purchased was only partial. Though free from the stench and vermin that infested their former quarters, they were obliged to witness the perpetration of tortures which they were powerless to prevent. The consequence was, that their sensibilities were gradually hardened, and at last they looked with unconcern on scenes which would once have excited the liveliest emotions of horror and pity.

At the end of three or four days they were taken back to their old quarters, where their former discomforts were renewed. In the mean time their houses had been searched and their property confiscated. As it was now known that they had no money which torture could cause them to give up, the bamboo infliction was no longer resorted to, and they were allowed more privileges than formerly. The superstitious fears of the Burmese were well illustrated by the treatment of one of the prisoners who had been incarcerated in the *Let-mayoon*, because he said he could fly. The keeper, who was responsible for his safe-keeping, being terribly afraid that this featherless biped would contrive to take wing during the night, did all he could to prevent such an iniquitous attempt. Thinking that there must be safety in a multitude of contrivances, he had numerous arrangements to keep the *jail-bird* down to earth. He was first put in three pairs of irons, his feet were placed in the stocks, and his wrists bound together with a long rope tied to one of the rafters of the roof of the building.

His long hair was then twisted into braids, each braid being fastened separately to the floor, and another rope, also attached to the floor, was tied round his waist. After taking these precautions the jailer stood over the helpless prisoner, as if to devise some new means of preventing his flight. For further security, the ingenious keeper passed strings through the large holes pierced in the captive's ears, confining them also to the floor. Being still anxious lest the creature should fly away, he gave the savage who stood on guard with his club strict orders to brain it as it rose. Meanwhile the poor lunatic expressed contempt for their precautions and confidence in his ability to elude them. When the jailers became satisfied that he could not carry out his intentions, they gradually released him from his bonds.

Through the kind offices of Mrs. Judson the prisoners were permitted to remove from the fetid inner prison, which would have been intolerable during the heats of summer, to cells outside. Though these were so contracted that it was impossible to stand upright except in the middle, where the roof was highest, yet they were very comfortable compared with their former quarters. Gouger turned even the annoyances of the place to good account, spearing the rats that infested it, and presenting them as a peace-offering to his jailer, who prized them as a great delicacy. He still took pleasure, however, in tormenting the prisoners, reminding them that they would soon share the fate of the rats. Luckily for Gouger, his condition was compassionated by the jailer's daughter, a bright girl of sixteen, who supplied him with water for washing, a luxury which he now enjoyed for the first time during his imprisonment.

One night, while tossing sleeplessly on his bed, he heard shrieks proceeding from the inner prison, and, as his door was then unfastened, he went into the passage-way, and, looking through a chink in the wall, saw a young man stretched on the floor with his feet in the stocks, toward whom one of the ringed executioners was striding. Without saying a word, the *pah-gnet* stamped on the face of his victim with his heavy wooden shoes, and then beat him to death with a huge club. From his hiding-place, where he stood trembling with terror, Gouger could hear the bones of the victim crack and crash. The sight was so horrible that he resolved never to gratify his curiosity in this way again. A fire breaking out in his house not long afterward, he was charged with having been the occasion of it, for the purpose of destroying the combustible city. His life was only saved by the testimony of a friend at court that the fire was purely accidental. This fire came near proving his ruin in another way. In his prosperous days he had kept a diary, in which, among other things, the acts of the governor were commented on rather freely. Fearing that its discovery would compromise his safety, he gave orders, when first imprisoned in the barracks, to have it destroyed. The man intrusted with the execution of this order, knowing the writer's appreciation of his diary, placed it in a small box which he hid in a hole dug in the ground under the house. Fortunately for Gouger, on learning, a few days before the fire broke out, that the book had been concealed in this way, he repeated his order, and it was accordingly dug up and destroyed. This almost providential caution saved his life. The house being burned down, the Burmese, as is their custom, dug all over its site in search for buried treasures. Had the box, with the diary containing strictures on the character and acts of the king and other high officers of the government, been discovered, its owner would undoubtedly have paid the penalty with his life. Mrs. Judson, the missionary's wife, who kept a similar diary, tells us, in the life of her husband, that she destroyed it on the first indication of approaching hostilities.

Among the additions to the native inmates of the prison during the latter part of Gouger's confinement was a man of herculean size and strength, who, from the use made of him by the sovereign, was called the "King's Horse." It was his duty to attend his majesty in his daily walks, and to carry him when tired. His broad shoulders made an excellent saddle, and it was ludicrous to see him kneel down at a given signal while the king mounted the intelligent animal, who rapidly trotted off with his royal load. The creature was put in prison because a town, whose revenues had been given him for provender, was gobbled up by the British army, but the king, finding him indispensable to his comfort, wisely ordered his release before his paces were injured by his fetters, or his constitution undermined by the impurity of his stable.

Gouger afterward passed through a variety of adventures—at one

time narrowly escaping contagion from being chained to a leper, and subsequently kept with some fifty other prisoners in the same quarters with a woman afflicted with the small-pox, owing their immunity from infection to the free use of tobacco; then tormented by fear of being devoured by a lioness, which was brought into the prison for that purpose, but was allowed to die of starvation; the Pacahm-woon, the Burmese generalissimo, having concluded to bury the white prisoners alive at the head of his army, he was only prevented from carrying his threat into execution by his arrest by order of the king on a charge of treason. His punishment was terrible. After being dragged and beaten through the town, he was trodden to death by elephants.

The victorious advance of the British army, and the demand of its general for the instant surrender of his countrymen confined in Burmese prisons as an indispensable condition of peace, resulted in the release of Gouger. He had reason to be grateful for his liberation from a protracted imprisonment, which, in its combination of physical privation and peril, with unceasing and intense anxiety of mind, is one of the most remarkable on record.

ALEXANDER YOUNG.

HORSEMANSHIP.

“ON which side of a lady-equestrian should her escort ride, and why?” is the question that came to me from a pleasant “Neighborhood Club” in one of our suburban towns, which is but little less, in fact, than an extension of Fifth Avenue into the hills of Westchester.

The cavalier, to be in the right, should be on the left. If on the right, he is in the wrong. In other words, the gentleman should always be at the lady's *left* hand, having her on *his* right. I use the word always in its full force, applying it to all countries, whatever the local law of the road (excepting only momentary exigencies), and to both styles of riding, whether the barbarous, awkward, and dangerous sideways style for which we are said to be indebted to Ann of Bohemia, or the easy, safe, and *natural* mode practised by the wife and daughters of the Turkish pacha, the Tartar chief, the South-American Gaucho, or the North-American Comanche, and, within a few years, by the wife of a President of Peru and other ladies of Lima.

And now for the *why*.

To meet this branch of the question, let us start from first principles.

Until the fashion changes—and it is likely to last some years longer—a man's right hand is his handiest hand. It may be called his *working* hand, and the left his *holding* hand, on saddle-duty. On horseback, then, the left becomes the bridle-arm, while the right is free for “detached service” with lasso, lance, sabre, or riding-whip.

The theory of horsemanship holds that, in riding, and especially in riding with a lady, the man is master of his steed, and, under all ordinary circumstances, can guide and control him with his bridle-hand alone, leaving his right arm free for any service that may require it. It also assumes that he rides, not merely to accompany the lady, but to protect and assist her in any emergency. And this assumption is an admission not only of his supposed superior mastery of his horse and greater strength, but of his more natural, and, therefore, safer seat in the saddle.

His duty, then, being to guard and aid the lady with his best arm, where should the horseman be placed to render the most efficient service? Unquestionably at the lady's *left* hand, where she is within the readiest and most effective reach of his right. Riding in that position, he can readily place his hand on her bridle-rein, and aid in controlling her horse without interfering with the management of his own. He can converse with her more comfortably for herself, as she can, from her position in the saddle, easily turn her head to her left, while turning it to her right would be awkward and irksome.

On her left he protects her riding-skirt from the contact of passing vehicles, to which, under our law of the road, she is exposed if he rides on her right; and he also prevents her skirt from flying in the wind. At her left he is in the best position to prevent her falling from her horse, whether from the horse's “bolting” or “shying,” one against the other, or from the turning of her saddle through slack-

ened or breaking girths, as, with her sideways seat and the pressure of her foot on the stirrup, her saddle is very much more likely to turn to the left—toward him—than to the right. This turning of the saddle, through carelessness of grooms, or the slackening of girths after a horse has been ridden a while, is by no means infrequent, but, in my own experience, I have never known an instance of its turning to the right.

Again, riding at the lady's left, her escort is in the only proper place to render effective aid in case of a fractious or runaway horse, either by a powerful hold on her bridle-rein, or, in the last emergency, by throwing his strong right arm around her and lifting her from her saddle.

This last feat is almost, if not absolutely, impossible while riding at the lady's right. To say nothing of having to use, in such an attempt, the comparatively weak and awkward left arm, the lady's person and long skirt would have to be drawn over and across the side-saddle and the back of her horse. On the other hand, from her left, with the strong right arm to support her, she has only to clear her right leg from the saddle-horn, drop her reins, and—lifted easily from her seat—her horse passes on from under her.

I have not only practised this in teaching a young lady to ride, but I have seen it handsomely done in actual runaway experience on the road. The lady's horse ran, her saddle turned—to the left, of course—and the pursuing cavalier galloped up on that side, threw his right arm around her, cleared her from her horse, and landed her unharmed on the ground.

The minor reasons sometimes urged against the gentleman's riding on the left, or why he *should* ride at the right of the lady, are scarcely worthy of remark. As there is no telling when the contingency may arise requiring his best and most knightly service, the mounted cavalier should consider himself as strictly on duty, and be always at his proper post. All lesser considerations should give way to that. Upon the lady's right he *cannot* assist her as effectively as when she is on his right. He cannot seize her bridle-rein, except by crossing his right arm awkwardly over his left, or by shifting his own reins and giving his weaker left hand to her service, and he cannot draw her from her saddle and across her own horse with his left.

Some urge that on her left he is likely to be crowded unpleasantly or dangerously against the lady's feet. Not very likely, if he is a horseman, and the horses, as they should be, trained to their work. It is assumed that he is a horseman, or he should not be riding with ladies, and, if he is, he can readily keep his horse in proper position; and, if he does strike against her horse from her left, he can hardly cause her to fall, which she might readily do in a similar case from her right.

The objection that, being on her left, he is likely to soil her skirt, is not worth notice. The idea of the skirt is that it is a mere over-all (often literally such, even now, in the country), of some inexpensive material to keep her dress from soiling, and a well-groomed horse is not likely to soil it seriously.

The mistaken practice, so long in vogue in New York, of having the gentleman ride on the lady's right, is supposed to be a senseless imitation of the alleged English habit in that respect. I say senseless imitation, because, if such is the English fashion, we have adopted it in disregard of the fact that their law of the road is “Keep to the left,” and they ride on her right, it is said, to protect the lady from passing vehicles. But, if such is the English custom, I hold it to be wrong, despite their law of the road. In “keeping to the left,” so that meeting vehicles pass her on her right, a lady-equestrian is not particularly exposed, as there is no skirt on that side to catch, and her horse will look out for himself that he is not struck. There is, therefore, small need for her cavalier there.

Since the opening of our Central Park I am pleased to note that some of our New-York equestrians are dropping the cockneyism of having the lady on the left. There are more out who know how to ride and where to ride.

To recapitulate. My answer, then, to the club question is, in brief, that the gentleman should ride on the lady's left, because it is where his aid is most required and can be best rendered. It is his only proper position as a true horseman on escort duty with ladies.

Our law of the road, horsemanship, ladies' saddle-horses, and bridles and bits, are branches of this subject on which I may venture a note or two hereafter.

A. STEELE PENN.

TABLE-TALK.

IT has long been obvious that, if dramatic art is to maintain a place among the intellectual professions, something must be done to secure more certain accessions of talent. The stage has been supplied solely in a chance way by chance men. Those who have adopted the profession have done so in the face of popular prejudices, and with the certainty of losing social caste. That so many men and women of culture and talent should be found on the stage, in view of all the deterring circumstances, is a matter of surprise; but, if the art in the great future, amid the advancement and development that will mark all other branches of intellectual effort, is to maintain its rank, not only must the social disabilities that have so far been inflicted upon the actor be removed, but academies or colleges will have to be established as sources of supply. The opportunity to found a dramatic college with a competent president now exists. Delsarte, the instructor of Rachel and Sontag, who has formulated the art of dramatic expression, and reduced it to a science, has been ruined by the late war, and looks to our shores for suitable employment of his talents. Mr. James Mackaye, a gifted American pupil of the great teacher, has been expounding and illustrating the methods of Delsarte in Boston and New York to surprised and delighted audiences. Until Delsarte discovered and elaborated the law of expression—and his discovery is as applicable to sculpture and historical painting as to dramatic art—instinct and intuition were the sole guides of the artist. The great artist has usually, no doubt, been right in his intuitions; but no art can be grounded in absolute assurance of truth that cannot be scientifically formulated. That Delsarte has spent forty years in analyzing and classifying the principles of art, that he has found the fixed laws of all varieties of human expression, that he has reduced what seemed variable and capricious to exact formula—these are facts of the profoundest interest, but which we can only here state rather than explain. There will arise in many minds a natural distrust of art enforced by rigid law and exclusively artificial rules. Actors trained by methods of this sort would, according to our first apprehension, descend into facial contortions. But Delsarte is too great an artist not to perceive this danger. He exacts of his pupils a training so complete that the law of expression becomes eventually purely instinctive and spontaneous. He lays down the excellent rule that no gesture should be made except that which the situation imperatively demands, and pronounces the research for gesture the worst of vices. No rule for the public speaker could be better than this. The enforced gesture that marks most of our orators is abominable; and actors who are ever busy attitudinizing and gesticulating are among the least endurable of their class. If Delsarte's method did not serve as well to repress as to correctly direct, it would fulfil but half its duty. That a better training of actors is necessary is only too apparent every time the theatre is visited. The notion that acting is something purely of impulse and genius has been spread-

ing during all the time Delsarte has been building up his method; and now it is almost impossible to find among the younger performers a man who can even read correctly. An academy that would teach young men how to deliver language with good accent and good discretion, and teach them how to correctly express passion by look and gesture, without exaggeration or undue prominence, would serve greatly to advance an art now somewhat in its decline, but which has greater power to please and elevate mankind than almost any other form of intellectual amusement.

— Our venerable and beloved poet Bryant, who has reached the great age of seventy-seven without the usual infirmities of old age, and with his strength, activity, and bodily and mental faculties in remarkably good preservation, has recently given, in a letter to a friend, an account of his habits and of his daily life, from which we may perhaps gather the secret of his longevity and of his wonderful maintenance of strength and health. He says: "I rise early—at this time of year, about half-past five; in summer, half an hour, or even an hour, earlier. Immediately, with very little encumbrance of clothing, I begin a series of exercises, for the most part designed to expand the chest and at the same time call into action all the muscles and articulations of the body. These are performed with dumb-bells—the very lightest—covered with flannel, with a pole, a horizontal bar, and a light chair swung around my head. After a full hour, and sometimes more, passed in this manner, I bathe from head to foot. When at my place in the country, I sometimes shorten my exercises in the chamber, and, going out, occupy myself for half an hour or more in some work which requires brisk exercise. After my bath, if breakfast be not ready, I sit down to my studies until I am called. My breakfast is a simple one—hominy and milk, or, in place of hominy, brown bread, or oatmeal, or wheaten grits, and, in the season, baked sweet apples. Buckwheat-cakes I do not decline, nor any other article of vegetable food; but animal food I never take at breakfast. Tea and coffee I never touch at any time. Sometimes I take a cup of chocolate, which has no narcotic effect, and agrees with me very well. At breakfast I often eat fruit, either in its natural state or freshly stewed. After breakfast I occupy myself with my studies for a while, and then, when in town, I walk down to the office of *The Evening Post*, nearly three miles distant, and, after about three hours, return, always walking, whatever be the weather or the state of the streets. In the country I am engaged in my literary tasks till a feeling of weariness drives me out into the open air, and I go upon my farm or into the garden, and prune the trees, or perform some other work about them which they need, and then go back to my books. I do not often drive out, preferring to walk. In the country I dine early, and it is only at that meal that I take either meat or fish, and of these but a moderate quantity, making my dinner mostly of vegetables. At the meal which is called tea, I take only a little bread and butter, with fruit, if it be on the table. In town, where I dine later, I make but two meals a day. Fruit makes a consid-

erable part of my diet, and I eat it at almost any hour of the day, without inconvenience. My drink is water; yet I sometimes, though rarely, take a glass of wine. I am a natural temperance man, finding myself rather confused than exhilarated by wine. I never meddle with tobacco, except to quarrel with its use. That I may rise early, I, of course, go to bed early—in town, as early as ten; in the country, somewhat earlier. For many years I have avoided in the evening every kind of literary occupation which tasks the faculties, such as composition, even to the writing of letters, for the reason that it excites the nervous system, and prevents sound sleep. My brother told me, not long since, that he had seen in a Chicago newspaper, and several other Western journals, a paragraph in which it was said that I am in the habit of taking quinine as a stimulant, that I have depended upon the excitement it produces in writing my verses, and that, in consequence of using it in that way, I had become as deaf as a post. As to my deafness, you know that to be false, and the rest of the story is equally so. I abominate all drugs and narcotics, and have always carefully avoided every thing which spurs nature to exertions which it would not otherwise make. Even with my food I do not take the usual condiments, such as pepper, and the like."

— Mr. Booth has given us another great Shakespearian revival, this time surrendering the principal character to another actor. "Winter's Tale" has not been among the more popular of the Shakespearian acting-plays, although the part of Leontes affords good scope for an actor, and that of Hermione has a few scenes worthy of the best of our tragic actresses. It is some sixteen years since it was acted in this city, and this fact will make it new to many of our theatre-goers. With that disposition for lavish pictorial embellishment which it is now probably too late to oppose, "Winter's Tale" at Booth's is produced with a somewhat larger appreciation of the setting than of the acting. The principal character, Leontes, is in very good hands; but Hermione, while carefully, is very weakly, rendered; and Perdita—a difficult part to fill, no doubt—while also closely studied, fails to satisfy our idea of this most delightful creation. As a picture, the play is superb. The period of the action affords opportunity for rich and picturesque costuming, and almost every scene is very much enhanced in pictorial effect by the beauty of the groupings in the foreground. The management has taken all pains to give to every scene and accessory entire historical correctness. This painstaking contrasts oddly with the looseness of the poet in the same particular. When anachronisms occur in almost every line, and entire scenes are copies of English rather than Sicilian life, an error of the stage-manager might well be forgiven. But the extraordinary care taken to accurately reproduce the period of the play leads us to believe that no such error exists. The great scene is that in which Hermione appears before the tribunal in the amphitheatre. Here the stage and scenery are so arranged that the spectator gains a complete idea of the vastness of the ancient theatre. It is a complete triumph of

scenic illusion. A group of real figures against a background of painted figures has always been considered an error in art; but in the scene at Booth's this arrangement is so artistically and skilfully managed that the effect, usually in such cases incongruous and absurd, is produced with entire unity and marvellous suggestion of number and extent. This scene, so lofty, so spacious, so animated, so full of life and motion, so splendid in sumptuous contrast of color, is a triumph of what may be called the scenic-historic art. So long as the stage can reproduce historic periods with such marvellous completeness of effect and illusion, the lovers of spectacle have a triumphant argument in defence of the art. But in this very scene, so admirably conceived and executed, is one of the best situations of the unhappy queen; and the lover of the drama is mortified to find a Shakespearian scene presented with so much care in all its accessories, but acted with so little knowledge. There should be an actress on the stage capable of giving Hermione's noble and eloquent appeal with its due effect. It is unworthy of Shakespear, unworthy of true art, unworthy of the management, that the setting of the scene should have been more considered than the intrinsic situation itself. The defect of the acting is more apparent here than elsewhere. All the scenes of the play are, pictorially considered, very beautiful; good taste, careful study, large knowledge, are apparent throughout. We are only prevented from hailing its production with admiration by the fact that the balance of things has not been well preserved, and that—which seems almost inevitable in these revivals—the scenes, characters, passion, and poetry of the play have been too much subordinated to what should be purely accessory.

— The importance of manners has a different measure with every grade of culture. The line between what is essential to good breeding and what is merely conventional is drawn by different persons on a different plane, so that what one assumes to be a mark of culture, is by another derided as an over-refinement. But are not over-refinements better than under-refinements? Is it not better to carry punctiliousness a little too far than continually to be sinning against those minor morals on which the pleasure of intercourse so much depends? In America there is so much general neglect of the nicer qualities of breeding, that those who set punctilious examples ought to be looked upon as public benefactors. But, in order that these mentors should be studied and followed, it is necessary to arouse in the public mind a better appreciation of good-breeding. In the United States, that quality of character expressed by the Yankee word *clever*, is always popular. Good-natured men and women are so heartily liked, that amiability is continually mistaken for good-breeding. A fellow that *means* well is at once assumed to have graduated in the school of manners; his cheerful or accommodating spirit covers a multitude of sins, and he is at once elected to the rank of a gentleman. Such a person may be untidy in person, inelegant in speech, familiar in discourse; he may spit upon the carpet, carry his hands in his pockets, eat with his knife, and

be guilty of numerous offensive habits—these, according to the ideas of the multitude, are venial offences, if offences at all, provided the person has a kindly disposition. But kindness, while a great virtue, is not sufficient for the intercourse of society. Training is necessary to repress and art to express. A good-natured fellow may cover one with his tobacco-saliva, and this is not apt to establish good-nature in the bosom of his victim. A good-natured fellow may sit before you eating, and so bury his knife to the handle every time he carries a morsel to his mouth that, in nervous dread, your own capacity for eating is destroyed. An amiable fellow may so persistently masticate his toothpick while he is talking with you, that you would willingly accept a little acid in his composition in exchange for this unpleasant habit. Just as in greater morals, more mischief arises from heedlessness than from malice, so in manners, more annoyance springs from the carelessness of well-meaning people than from the rudeness of bores. Absolute, intentional rudeness is so rare that it is hardly necessary to denounce it. Social annoyances spring almost altogether from the ignorance or inattention of worthy people; and hence it would seem that the real bar to a better culture is good-nature, which, by prompting to the excuse of bad manners, prevents their reform.

— A gentleman, well acquainted with New York a third of a century ago, but who now resides at a distance from the city, told us, during a recent call at our office, that he well remembered Louis Napoleon when he was here, an exile, in 1837 or thereabout. "I remember," said he, "seeing Fitz-Greene Halleck and the 'nephew of his uncle' taking Bluepoint oysters together, one cold November morning, at Florence's half-shell counter, corner of Park Place and Broadway; and, young and healthful as I was, I envied the imperial exile his splendid appetite, and the cordial manner with which he scraped acquaintance with those illustrious bivalves—hereditary descendants of the 'first families' in their luscious kind. I doubt very much whether the poor deposed emperor enjoys his lunches or his imperial wines now as he did then. But, if his pictures do him any justice now, he must look a great deal better than he did at that time. His aspect was uncomely; his dress, not only careless, but untasteful; his features, certainly not disfigured by expression of any kind; and his eyes, especially, as lack-lustre as a boiled fish's." Speaking of Garibaldi, our friend said: "I met him on different occasions, two or three times. When he was keeping his soap-and-candle manufactory on Staten Island, and resided there, he used to spend his Sundays with Italian friends, most of whom were prominent musical artists in the Italian Opera, at Hastings-on-the-Hudson. A friend, living at Dobb's Ferry—an accomplished student and enthusiastic lover of Italian literature—entertained him at dinner; and I met him once or twice at his table. He was a finely-formed man, self-possessed, with a face of striking intelligence, and great modesty of manner. He was well versed in the works of Italy's great authors, and discussed them with my friend in excellent English—very quiet,

unconsequential, speaking from a full mind when he *did* speak, and saying nothing when he could not."

Literary Notes.

MR. HENRY SUMMER MAINE, whose work on "Ancient Law" marked an epoch in the history of jurisprudence, has recently published a collection of six lectures, delivered last autumn, intended as an introduction to a larger course on the subject of "Village Communities in the East and West." The main subject of the work is "an expansion of a theme distinctly enunciated in the 'Ancient Law,' but now strengthened by a more intimate acquaintance with the village-communities of India—namely, the origin of private property. The historical value of the discussion rests on an assumption that ought to be distinctly stated, although it is one that can hardly be denied by any one who is familiar with Professor Maine's former book; it is to infer the ancient form of an existing institution, not only from historical records, but from analogous examples still to be found in the world. Such a method rests upon the uniformity of social phenomena, and the belief that the higher forms have grown out of the lower, instead of supposing that the lower are a departure from the higher. The speculations of Hobbes, Locke, Rousseau, and the other partisans of the theory that society was based originally on contract, and by the willing submission of independent units to a central authority, in order to escape the perils of anarchy, were consistently applied by them to the origin of property. Individual and absolute ownership was considered the original and primitive form of property. Professor Maine contested that view in his 'Ancient Law,' and the present work is a more ample and developed confirmation of his own theory. He holds that property was originally held in common, and the stages by which it passed into individual ownership form one of the most instructive studies in legal history. The interest of the question turns chiefly upon the ownership of land; for, until modern times, other kinds of property were of far less importance. In agricultural communities, such as those of India, and the ancient Germans and Scandinavians, there is little to quarrel over except the land. It appears, then, that we must go to the village-communities to ascertain the ancient ideas on the holding of property in land. On this subject, Professor Maine quotes the results of Von Maurer's investigation into the remnants of communistic usages in England and the Teutonic nations, and compares them with the facts he has been able to ascertain in regard to the village-communities in India."

Messrs. Mills & Co., of Des Moines, Iowa, have published in two large and handsome volumes the "Report on the Geological Survey of the State of Iowa to the Thirteenth General Assembly, January, 1870, containing Results of Examinations and Observations made within the Years 1866, 1867, 1868, and 1869, by Charles A. White, M.D." This valuable and almost exhaustive work divides its theme into several divisions, consisting, first, of a brief history of geological labors previously performed in Iowa; second, descriptions of the boundaries and area of the State, its general topography, drainage, character of its rivers and lakes; third, the general geology of the State; fourth, county and regional geology, in which the resources of various sections are fully and minutely given; fifth, embracing au

account of the minerals of the State, including its stone, and other materials of economic value, with analyses of waters, coals, peats, etc.; sixth, tables of the elevation of each station, stream, and principal point crossed by fourteen railroads of the State, catalogues of all the birds known to inhabit the State, and an illustrated description of government land-surveys. It will be seen by this summary that the work is comprehensive; and, as it is written in a clear, simple, untechnical style, it is of great value to general readers who may wish instruction as to the resources of this State. The volumes would be handsome specimens of book-making anywhere, and are quite notable in this particular, coming from a section where the art might be supposed to be in its infancy.

An interesting volume on celebrated operatic composers, by Carlo Fanti, has recently been published in Milan. The author has taken pains to ascertain as accurately as possible the compensation which the leading composers of our times received for their works. According to his statements, Meyerbeer received for his compositions more than Rossini by nearly three hundred thousand francs; Bellini did not realize over sixty thousand lire for his operas; Donizetti received altogether about two hundred thousand lire, but left his family hardly money enough to pay for his funeral expenses. Gounod has realized for his "Faust" alone two hundred and twelve thousand francs up to the year 1870; and Richard Wagner received up to the same time for his "Tannhauser" about one hundred and thirty-five thousand francs. Verdi's average income since 1850 is stated at thirty-four thousand lire. Boieldieu's heirs still receive every year between seven and eight thousand francs for his "Dame Blanche."

Miss Yonge's "Musings over 'The Christian Year,'" and "Lyra Innocentium," will interest every admirer of Keble's famous work. The "Musings" gain value and interest from the "Gleanings of Recollections" of the reverend author, which form a large part of the volume. Keble's "Christian Year" has filled a place among one portion of the religious community second in affectionate regard only to Bunyan's great allegory. It has cheered, soothed, sweetened, and inspired many minds; and all who have derived pleasure from its pages will be glad to establish that better personal acquaintance with the poet which this volume affords them the opportunity to do.

Baring-Gould's "Gabrielle André" is a novel of the first French Revolution, powerfully written, and of great dramatic interest. It will surprise many readers to find a writer, known principally hitherto in literature as the author of learned philosophical and historical treatises, devoting himself to works of imagination. In "Gabrielle André," Mr. Baring-Gould conspicuously exhibits his genius for this class of literature. He has great talent for description, excellent perception of character, and, what in fiction is more necessary than any thing else, genius for incident and dramatic action.

"The Fight at Dame Europa's School, showing how the German Boy thrashed the French Boy, and how the English Boy looked on," is a satirical *brochure*, which in England obtained an immense circulation, and is now reprinted here, with illustrations by Thomas Nast. The satire was more successful among English readers than its merits warranted; but here it has double point by means of the comic drawings of Mr. Nast, whose pencil enforces

the satire almost more tellingly than does the pen of the author. Felt & Co., of New York, are the publishers.

Ponson du Terrail, the French romancist, who died a few months ago at Bordeaux, was comparatively the most productive writer of fiction France ever had. In the last sixteen years of his life he wrote no fewer than two hundred and three large novels, and it is said that his famous "Rocambole" alone had a sale of one hundred thousand copies. Ponson du Terrail wrote most of his MSS. at a small coffee-house on the Boulevard du Temple, in Paris, which in his honor is now called Café Rocambole.

Russia boasts of having a new Kryloff in the person of Ivan Detloff, of Kiev, whose fables have met with an unprecedented success. Detloff is a tailor by trade, and of German descent. He was nearly twenty years of age before he learned the Russian language, and now, twelve years later, he bids fair to obtain one of the foremost places in Russian literature.

The very general discussion by the press of Darwin's "Descent of Man" has, instead of exhausting public interest in this latest scientific question, greatly stimulated it. The sale of Darwin's work is almost unprecedented in scientific literature. Mr. Mivart's "Genesis of Species," which so ably presents the argument against Darwin, is also very widely read, and contributes much to the interest of the discussion.

If the Germans do not obtain very correct information in regard to the recent war, it will not be the fault of their historians; for, besides the nineteen histories of the war which have already appeared, no fewer than thirty-seven new ones are announced in press. Old General von Moltke will personally write the official history of the war, of which the first part will be issued next October.

Messrs. Scribner & Co. have added to their valuable illustrated library "The Wonders of the Heavens," from the French of Camille Flammarion by Mrs. Norman Lockyer. This volume is fully illustrated, and affords a complete survey of the grand mysteries and wonders of astronomy. It forms the twentieth volume of the wonder series.

The Poems of Lucy Hamilton Hooper have been published by J. B. Lippincott & Co., in a very beautiful volume, which forms an appropriate dress for the graceful and refined contents. Mrs. Hooper has few equals among our living female poets, and we are proud to recognize in this volume several pieces that first saw the light in the pages of this JOURNAL.

The *Academy* states that Mr. W. R. S. Ralston is engaged upon what seems likely to prove an interesting book on the popular literature of Russia. It will be divided into three parts, of which the first will be devoted to the songs of the people, the second to the epic poems, and the third to their prose stories.

Messrs. Devlin & Co., the well-known New-York clothiers, issue for a gratuitous distribution a small hand-volume, entitled "The Metropolis explained and illustrated in Familiar Form." It contains much valuable information for strangers visiting the city, and is accompanied with a good map.

The Italian novelists seem to be quite busy this year. No fewer than ninety-one new novels are announced by the publishers of Milan,

Florence, Rome, Venice, and Naples. Formerly there were few years in which more than fifty novels were issued by Italian publishers.

Gervinus has left an additional volume of critical remarks on Shakespeare's plays, an unfinished manuscript of personal reminiscences, and a volume on Italian art, all of which will be published next fall at Heidelberg.

Some learned Armenians at Constantinople are engaged in translating the Bible again into the Turkish language. The existing translation, especially that of the New Testament, is said to be very imperfect.

Mr. F. T. Palgrave is about to publish a volume of lyrical poems, which have been long in hand, and include "Alcestis," and others of what are now styled the idyllic class.

The three Scandinavian states, Denmark, Sweden, and Norway, have at present but four monthly literary magazines and two quarterly reviews.

The daily papers of Berlin have an aggregate circulation of two hundred and twenty-one thousand five hundred and ninety-three copies.

Foreign Items.

IT is a somewhat curious fact that several of the sovereigns of Europe do not speak the languages of their respective countries very purely. The Czar of Russia speaks Russian with a marked German accent, and the same is said of the Danish of King Christian IX. of Denmark. Amadeo of Spain speaks the language of his new country very imperfectly, and the Greek of King Georgios is still so broken that it is a standing joke among the disloyal portion of his subjects. Victor Emmanuel's Italian is such that his Sardinian accent is recognized as soon as he opens his mouth. The Emperor William speaks German with a marked Berlin accent, and in Sweden the opposition to King Charles says that he speaks better French than Swedish.

At the last interview which the Princess Salm-Salm had, after the death of her husband at Gravelotte, with the Archduchess Sophia, the mother of the unfortunate Maximilian told the princess that she should receive either an estate in Bohemia in her own right, or an annual pension of three thousand florins. The princess, who does not like to live in Austria, preferred the pension. From the Prussian Government she has received, since her husband's death, three hundred dollars a year.

An extraordinary scene occurred recently at the opera-house in Bucharest. Prince Charles of Roumania and a crowded audience witnessed the performance of Auber's "Masaniello." At the celebrated revolutionary stabbing-scene in the third act, nearly every man in the pit rose from his seat, and the house resounded with furious threats against the prince, who turned very pale, and immediately left the house with his escort.

Urbano Rattazzi, the Italian lawyer and statesman, has amassed a large fortune in the last twenty years, mostly by very judicious real-estate investments. By the removal of the seat of government from Turin to Florence he is reported to have made in the course of two months, by the rise of property he had bought in the latter city, nearly one hundred thousand dollars.

Döllinger, the leading German opponent of the infallibility dogma, and Bishop Ketteler, of Mayence, its ablest defender in Germany, were both members of the German National Assembly in 1848, and Ketteler on one occasion rebuked Döllinger there for what he called his blind ultramontane zeal. And now Ketteler has induced the pope to excommunicate Döllinger for his liberalism.

Prince Christian, of Augustenberg, Queen Victoria's son-in-law, who, previous to his marriage, was so poor that he could not afford, as he acknowledged himself in a letter to a friend, to keep a box at the Berlin Opera-House, has now saved so much money that he has been able to pay all the mortgages on the estates of his family in Schleswig-Holstein.

General Fleury, the intimate friend of Napoleon III., and at the time of the overthrow of the second empire minister to Russia, has recently made several attempts to commit suicide, and his wife has to watch him day and night in order to prevent him from renewing them.

The Princess Pauline de Metternich played the other day in Vienna, at an amateur performance of Offenbach's "Grand-Duchesse," in which only members of the highest Austrian aristocracy participated, the rôle of the grand-duchess to the great satisfaction of the distinguished audience.

It has now been definitively settled that the coronation of William I., as Emperor of Germany, will take place next September at St. Bartholomew's Cathedral in Frankfort-on-the-Main. All the sovereigns of Europe will be invited to be present at the imposing ceremonies.

The Queen of Denmark is a very accomplished needlewoman, and she has told many persons that she was proud of making her own dresses. In her youth she was quite poor, and never dreamed that she would one day sit on a royal throne.

The private advisers of the pope have recently urged him to extricate the papal exchequer from its present troubles, to offer for sale Castle Gandolfo and two or three other country-seats, which, they say, would bring very large prices at present.

The King of Bavaria told Paul Heyse, the German author, recently, that he intended to make the Royal Theatre, at Munich, superior to any dramatic and operatic stage in the world, and that he would spend half a million florins of his private fortune for that purpose.

The restoration of the Germanic Empire will be celebrated on the 1st of July next at the Kyffhäuser Mountain, amid imposing ceremonies, at which all the German princes and delegations from the Legislatures of all German States will be present.

The autograph market in Germany is at present very dull, and the dealers in Leipsic, where upward of a hundred and fifty thousand thalers' worth of autographs are sold annually, have been obliged to reduce their prices fifty per cent.

The petty princes of Reuss, in Germany, are doing a profitable business by selling patents of nobility to ambitious burghers. One hundred thalers are sufficient to make any man a baron by the grace of the potentates of Reuss.

Bishop Dupanloup, it is said in France, is so mortified at a private letter which he has

recently received from the pope, that he intends to resign his position and retire to the large farm which he owns in Touraine.

Bishop Ketteler, of Mayence, who, it is said, will soon receive a cardinal's hat from the pope, and who is now the leader of the Ultramontanes in Germany, was formerly an officer in the Prussian light cavalry.

Hoff, the Berlin malt-extract man, has become in fifteen years a millionaire by extensive advertising. He asserts that he has paid to daily and weekly journals in that space of time the enormous sum of three million thalers.

A box filled with old letters and documents, among them many curious and unpublished papers written by Richelieu and Mazarin, has been discovered in a vault near Mongeville, in France.

The Queen of Prussia has given one thousand thalers to the society started in Berlin for the purpose of devising original German fashions.

Kommissaroff, the peasant who saved the life of Czar Alexander II., in the year 1866, is now an inmate of a lunatic asylum.

Verdi, the composer, is nearly deaf, and writes his operas in a room where there is no musical instrument whatever.

Queen Victoria is building a very beautiful villa near Coburg, in Duke Ernest's duchy.

Richard Wagner has accepted an invitation from the khédive to visit Egypt.

Miscellany.

Professor Gervinus.

GEORG GOTTFRIED GERVINUS, whose death has been lately recorded, was one of the most eminent writers of the age, and one of Germany's stanchest patriots in times when to be a patriot was to be more or less an outlaw. He was born in Darmstadt, in 1805, and was apprenticed at an early age, first to a bookseller, next to a banker. But already, in 1824, having broken with his commercial career, he enrolled himself among the students of the Giessen University, which he soon left to sit at the feet of Schlosser in Heidelberg, where, in 1830, he became "Docent" in his turn, having produced his first work, "The History of the Anglo-Saxons." Three years later his "Historical Writings" procured him, on Dahlmann's recommendation, the professorship of History and Literature at Göttingen. He then commenced his great work, "The History of the Poetical National Literature of Germany," five volumes (1835-'42), the title of which was changed in its fourth edition into "History of German Poetry." Next followed his "Outlines of Historiography," "On Goethe's Correspondence," a canto of "Gudrun," a fragment like his "History of the Art of Drinking," in which he intended to show how the cultivation of the vine had always gone hand in hand with the culture of the people. In 1837 Ernest Augustus, Duke of Cumberland, came to the throne of Hanover, and Gervinus, together with six other Göttingen professors, signed the famous protest against the *coup d'état* with which the former had inaugurated his rule—a protest of which, by-the-way, that unfortunate Professor Ewald, now the loyal "particularist," has never since ceased to "sing and to say." Gervinus was not only the author of the protest, but also its propaga-

tor, and, while the other professors were simply dismissed, he was compelled, by a special rescript, to quit Hanover within three days. He returned to Heidelberg, where, with few interruptions, he has ever since occupied the chair of German Literature. But abstract studies did not suffice him. Ever anxious to awaken the torpid national sense of subdivided and prince-ridden Germany, he busied himself with newspaper work as well, while the movement of the Deutsch-Katholiken gave rise to several separate pamphlets from his pen. His "Heidelberg Address to the Schleswig-Holsteiners" (1846) stirred up one of the most powerful agitations throughout Germany, the consequences of which have indeed been more momentous than its author was probably aware of. In 1847 he founded, together with Mathy, Mittermaier, and Häusser, the *Deutsche Zeitung* the representative organ of German Constitutionalism, which, chiefly in 1848, exercised an enormous influence upon public opinion. Elected to the National Assembly of Frankfort, he soon wearied of its fruitless labors, and eventually, after the miserable *fiasco* of that body, turned entirely from politics to his former studies. In 1849 he produced his work on Shakespeare, and from 1855 to 1866 his *magnum opus*, "The History of the Nineteenth Century since the Vienna Treaties." The introduction to this work, published separately in 1854, brought down upon him another prosecution "for agitation and high-treason," in which, however, the government was not successful. He was first partially condemned, and next entirely acquitted. Apart, however, from all these labors, he cultivated the art of music, and was one of the most zealous apostles of Handel in Germany. The Handel statue in Halle, the Handel Society, and the complete Handel edition, are mainly owing to his indefatigable zeal. His place in the world of culture will not easily be filled.

Schuyler Colfax on the Northern Pacific Railway.

Midway across the continent, at the head of twelve hundred miles of lake navigation, a thousand miles from Buffalo, the western terminus of the Erie Canal, and as near to it by water as Chicago, a hundred miles west of the longitude of St. Louis or Galena, is the young city of Duluth, the initial point of the Northern Pacific Railroad. The great work, so magnificently endowed by the government, is already being pushed rapidly westward, under its energetic controllers; and before the snow flies next fall it will be completed to the western line of Minnesota, where it crosses the Red River of the North, which runs northward to Lake Winnipeg, and one-eighth of its distance to the Pacific Ocean will have been accomplished. Commencing, too, this season, on its western line, the work will be prosecuted from both directions; and long before the nation celebrates its centennial anniversary of independence the lakes will be united by iron bands with that Mediterranean of our Northwest—Puget's Sound.

Of the auspicious influence of this enterprise, which but a few years ago would have been considered so daring, the most sanguine of its friends have scarcely yet a full realization. Even taking Chicago as the starting-point, it will be (*via* St. Paul, where an arm of this railroad is reached) two hundred miles less distance to Puget's Sound than to San Francisco. Besides this, vessels from the Golden Gate to China sail on what is called the grand circle, instead of in a straight line; and any one testing this by a string on a globe will be surprised at the result, if he have not previously studied the effect of the rotundity of the

earth, and its diminished protuberance as he goes northward toward the pole. Hence, when vessels have sailed eight hundred miles from San Francisco, they are only one hundred miles from the entrance to Puget's Sound, and this striking fact shows the advantages this route will have in commanding the through traffic of Asia with our Atlantic States, or that portion of it which will pass over the soil of this nation on its road to Europe.

Nor is this all. Development is the great duty of the republic, after all its recent trials. Resources are the gift of the Creator. Developing them depends on the work of man. Along the line of the Northern Pacific Railroad, as it follows up the water-courses, the Missouri and the Yellowstone on this side, and descends by the Valley of the Columbia on the other, a vast body of agricultural land is waiting for the plough, with a climate almost exactly the same as that of New York, except that, with less snow, cattle in the larger portion of it can subsist on the open range in winter. Here, if climate and fertility of soil produce their natural result, when railroad facilities open this now isolated region to settlement, will soon be seen waving grain-fields, and happy homes, and growing towns; while ultimately a cordon of prosperous States, teeming with population, and rich in industry and consequent wealth, will occupy that now undeveloped and almost inaccessible portion of our continental area.

But this road is fortunate, also, in its pathway across the two ranges of mountains which tested so severely the Pacific Railroad built on the central line, and the overcoming of which reflected such well-deserved honor on its energetic builders. At the Deer Lodge Pass, in Montana, where it crosses the Rocky Mountains, its altitude above the sea is three thousand five hundred feet less than that of the Union Pacific Railroad at Sherman, which is said to be the highest point at which a locomotive can be found in the world. And on the Pacific side of the continent it is even more fortunate. From Arizona up to the arctic circle, the Columbia is the only river which has torn its way through that mighty range—the Andes of North America—which in California is known as the Sierras, but which in Oregon changes its name to the Cascades. Nature has thus provided a pathway to the Northern Pacific road through these mountains, the scaling of which, on the other line, at an elevation of over seven thousand feet (a most wonderful triumph of engineering), cost the Central Pacific millions of dollars, and compelled them for seventy miles to maintain a grade of over one hundred feet to the mile—twice the maximum of the Northern Pacific at the most difficult points on its entire route.

It is fortunate, also, in its terminus on the Pacific coast. No one who has not been there can realize the beauty of Puget's Sound and its surroundings. One hundred miles long, but so full of inlets and straits that its navigable shore-line measures seventeen hundred and sixty miles; dotted with lovely islets, with gigantic trees almost to the water's edge, and safe anchorage everywhere; and stretching southward, without shoals or bars, from the Straits of Fuca to the capital and centre of Washington Territory—it will be a magnificent *entrepôt* for the commerce of that grandest ocean of the world, the Pacific.

Curious Names.

One of the most frequent causes of the bestowal of strange Christian names, is the existence of a singular or suggestive surname. This affords a temptation to the display of a denominational jocularly which often proves too strong to be resisted. It happens, indeed,

not seldom, that such surname is in reality far from denoting what it appears to denote. But this is of no consequence: the sound or look of the word is enough. We have not far to go for examples; and we will take a few as they present themselves. We notice, in the first place, the name "Sea Gull." Here the surname "Gull" owns no allusion to the bird which is so familiar upon our shores, although its owners facetiously turn it to account in that sense. "Gull" is likely to be from a Norse word meaning "gold;" or it may simply denote a dupe or fool. Then the registration indexes also gives us "River Jordan." In this instance the family name, which has its representative in France (as we remember from the *bourgeois gentilhomme*), and in other European countries, and which makes its appearance among our own surnames under several different aspects, is, in all probability, what it seems to be. The waters of the sacred stream were often brought here in crusading times to be used for baptismal purposes; and in these cases the baptized may sometimes have received the name of the river, which name would be liable, like all other personal titles, to become hereditary. Thus the conjunction "River Jordan" may be much more appropriate than its facetious inventors supposed. Some consider, however, that "Jordan" is a travesty of the word "Hodiernus"—a not unfrequent personal name in former days. "Arch Bishop," again, is a couplet to be found in the indexes. It is at least doubtful whether the surname has any reference to the ecclesiastical office. Among other combinations of the same class, we find in our lists a "Cardinal Wolsey Church," a "Green Leaf," a "Christmas Day," a "Lucky Day," a "Sing Song," a "Rose Budd," a "Seaman Skipper," a "Trial Palmer," a "Valentine Orson," a "Shooting Gallery," a "Royal King," a "Smart Natty," and a "Tempest Sleet." Probably a true explanation of the etymology of most of these surnames would entirely dispel the jocular illusion of the conjunctions.

Spain.

The King of Spain, whose election in the midst of the great war attracted but little attention in Europe, has already received ample warning of the troublesome character and insecurity of his position. The first tidings which met him on his arrival in Spain announced the murder of the prime minister who had selected him for the throne; and after an interval of a few weeks Señor Zorilla, who headed the deputation to Florence, has narrowly escaped assassination. Both crimes probably proceeded from zealots of the ultra-Republican party; but the king has not even the consolation of relying on the support of a united Conservative majority. Spain is not the only country which is divided by factions, or occasionally embarrassed by unprincipled coalitions; but nowhere else is opposition to the existing government so habitually regarded as a sufficient bond of union among those who are nevertheless divided by mutual enmities. At present, differences of political opinion are further complicated by dynastic preferences; and yet the respective adherents of three or four rival pretenders combine with the implacable adversaries of monarchs to weaken or overthrow the existing government. The ministers have themselves to blame for an imprudent act which has caused just discontent to several chiefs of the army. An unnecessary order that all general officers should take an oath of allegiance to the king has been disobeyed by important members of all the malcontent parties. The objections to all promissory oaths apply with comparatively little force to the military oath

which, since Roman days, has been used in almost all armies. No ceremony of the kind ever impeded mutiny, conspiracy, or treason; but tests, if they are in any case useful or justifiable, would seem to be appropriate methods of enforcing the duty of military obedience. A soldier is bound to be faithful, not only to the abstract state, but to its actual rulers; and if he affects to question the title of the reigning sovereign he may be justly punished or dismissed; but in Spain it might have been prudent to connive at hesitating loyalty, instead of forcing it to assume the form of disaffection. It is notorious that the generals of the Spanish army are politicians and partisans, and some of them had the strongest personal reasons for disliking the elevation to the throne of an Italian prince. After a time some of them might have been won over, and the king would have been better able to judge of his own ability to compel unwilling allegiance.

Two Newspaper Correspondents.

In the German camp before Metz, during its recent siege, there were two English newspaper correspondents whom we shall call A and B, each with his particular literary gift. A had great graphic power; but it was necessary for him to have seen what he described. He therefore roughed it with the poor soldiers; lay in the trenches, starved on the outposts; and, on the whole, had a very hard life of it out there. B was, on the other hand, an imaginative genius: it was not necessary for him to see the things that he described, nor even to hear of them; he evoked them out of his own consciousness, like the famous German philosopher—the fellow-countryman of those brave soldiers among whom B did not live. He lived at a hotel, remote from the trenches, and mud, and night-work, and composed his commentaries upon the siege of Metz in a first-floor sitting-room. It was necessary, he said, for an historian to be, above all things, calm and comfortable. News grew rare, and action slack. The Germans sat down outside Metz, the French within; they peered at one another over parapets, and potted each other's sentries (it was a wonder that in Metz they didn't eat potted sentry), but nothing more. The English public were getting eager for stirring details: a week had passed without a sortie. At last there appeared a grand account of one in B's paper; it was a sally of the first class, and full of picturesque incidents. B's paper sold like wildfire, for in this respect it possessed exclusive intelligence. No other paper had a word of the affair. Under these circumstances, the proprietors of A's journal wrote over to him indignantly to know why he had not sent them an account of it. Worse than the dull lover who makes no sonnet to his mistress's eyebrow, is the correspondent who leaves a sally undescribed. A mounted his charger, which had been in as many engagements as Wouverman's gray horse, and rode a day's journey—to B's hotel. B received him with effusion; gave him beef instead of horseflesh, *pâté de foie gras* in place of water-rats, and turned away his wrath. "Only," said A at parting, "confine yourself in future to individual combats. I don't mind you drawing upon your imagination for little facts of that kind. But no more general sorties. My proprietors won't stand it."

Snakes and Monkeys.

Brehm gives a curious account of the instinctive dread which his monkeys exhibited toward snakes; but their curiosity was so great they could not desist from occasionally satiating their horror in a most human fashion, by lifting up the lid of the box in which the snakes were kept. I was so much surprised at his ac-

count that I took a stuffed and coiled-up snake into the monkey-house at the Zoological Gardens, and the excitement thus caused was one of the most curious spectacles which I ever beheld. Three species of cercopithecus were the most alarmed; they dashed about their cages, and uttered sharp signal-cries of danger, which were understood by the other monkeys. A few young monkeys and one old Anubis baboon alone took no notice of the snake. I then placed the stuffed specimen on the ground in one of the larger compartments. After a time, all the monkeys collected round it in a large circle, and, staring intently, presented a most ludicrous appearance. They became extremely nervous; so that, when a wooden ball, with which they were familiar as a plaything, was accidentally moved in the straw, under which it was partly hidden, they all instantly started away. These monkeys behaved very differently when a dead fish, a mouse, and some other new objects, were placed in their cages; for, though at first frightened, they soon approached, handled, and examined them. I then placed a live snake in a paper bag, with the mouth loosely closed, in one of the larger compartments. One of the monkeys immediately approached, cautiously opened the bag a little, peeped in, and instantly dashed away. Then I witnessed what Brehm has described; for monkey after monkey, with head raised high and turned on one side, could not resist taking momentary peeps into the upright bag, at the dreadful object lying quiet at the bottom. It would almost appear as if monkeys had some notion of zoological affinities, for those kept by Brehm exhibited a strange though mistaken instinctive dread of innocent lizards and frogs. An orang, also, has been known to be much alarmed at the first sight of a turtle.—*The Descent of Man*, by Charles Darwin.

Love's Colors.

Not violets I gave my love,
That in their life are sweet and rare,
And deep in color, as the heart
Whose every thought of her is prayer;
For violets grow pale and dry,
And lose the semblance of her eye.

No lily's buds I gave my love,
Though she is white and pure as they;
For they are cold to smell and touch,
And blossom but a single day,
And, pressed by love, in love's own page,
They yellow into early age.

But cyclamen I chose to give,
Whose pale-white blossoms at the tips
(All else as driven snow) are pink,
And mind me of her perfect lips;
Still, till this flower is kept and old,
Its worth to love is yet untold.

Old, kept, and kissed, it does not lose
As other flowers the hues they wear.
Love is triumphant, and this bloom
Will never whiten from despair;
Rather it deepens as it lies,
This flower that purples when it dies.

So shall my love, as years roll by,
Take kingly colors for its own.
Sole master of her vanquished heart,
Am I not master of a throne?
Crushed by no foot, nor cast away,
My purple love shall rule the day.

Pearls.

Pearls are found in India, in Panama, in Scotland, in many fresh-water streams, but thoroughly good pearls are, notwithstanding, very rare. The value of a pearl is determined by its color and its shape. It may be either one

of three forms—a perfect sphere, egg-shaped, or in form like an acorn, with the base well rounded. The preferable tint is a slight golden one (not a yellow), mixed with a faint blush of pink. Those in which the pink predominate are specially prized. Steel-colored pearls have also their charm, but the tint should be decided, and not too much obscured. Pearls of good color, but of distorted shape, are not uncommon; but, in this form, they are only notable as curiosities. As the pearl is a natural substance, and worn just as it is rescued from the water, we can readily perceive how difficult it is to find one possessing at the same time the double merit of form and lustre. Small pearl, or seed pearl, are procurable in large quantity; they are fashioned by piercing and stringing them into beautiful ornaments, and mounted on mother-of-pearl fastenings. The only true pearl possessing all the merits of excellence is the Indian pearl, found at the island of Ceylon, especially on the Condatchy banks. A notable quantity come from Panama, but these seldom, if ever, have the lustre or accurate conformation of the Indian pearl. Scotch pearls, found in the Tay and Garry Rivers, have received a certain notoriety of late. We notice, particularly, a parure of native Scottish pearls presented to the Princess Louise, on her marriage, by the Duke of Argyll; they had, however, very probably more local fame than intrinsic beauty. It does not require quite so much precision to judge of a pearl as in the selection of a diamond. Accuracy of form is readily ascertained, but it is difficult to appreciate the shades of color. A pearl should have life and brilliancy, a certain softness of tints, for, without this play of color, size cannot make it beautiful. We were recently shown a brooch of mixed diamonds and pearls, at the establishment of Messrs. Starr & Marcus, of No. 22 John Street. One of the pearls was perfectly spherical, and beneath it hung a pear-shaped one, both types of the purest Oriental pearls. In shape and color they presented all those distinguishing traits of excellence peculiar to this chaste and elegant gem.

Varieties.

A GERMAN paper relates the following story: In the house of a clergyman's widow at Würtemberg, Bible-lots were being cast on St.-Sylvester's Eve for all the members of the family. While this was being done the children cried out, "Now we must draw a lot for our new emperor!" No sooner said than done, and they drew the lot from Hagzal ii. verse 9—"The glory of this latter house shall be greater than of the former, saith the Lord of hosts; and in this place will I give peace, saith the Lord of hosts." Struck with the emphasis of these words, they all declared that the verse should be sent to King William, and a letter was accordingly written to Count Bismarck at Versailles requesting him to forward it to the emperor.

A resident of Taunton, Mass., has obtained his ice for summer use for several winters past in the following manner: Procuring about fifty empty flour-barrels, at a cost of twenty cents each, he gradually pours in water, until each contains a solid mass of ice. The barrels are then put away in his cellar, and entirely covered with sawdust. As ice is required, a barrel is tapped.

When Alaska was ceded to the United States, the Russian Fur Company owned a magnificent library, which embraced the works of the greatest British and American novelists, as well as the more standard publications, in the English, French, German, and Russian languages. By the terms of the treaty this was transferred with the land, and was put up for sale at five cents a pound. A United States artillery company stationed in the region had a fund of two hundred and eighty dollars ac-

cumulated national money, which they invested in books at the stated price, and secured a library that would be worth a fortune almost to a man in the States.

A good story is told of a late college-president near Boston. On one occasion the students substituted a large dictionary in place of the Bible at the morning devotions. On opening the book he at once saw the situation; but he said nothing, and proceeded to the prayer, which he prolonged for an hour. The students got out of all patience; but they appreciated the sly remark of the venerable president on his retiring, that he "found all the words he needed in the volume they had placed on his desk."

The Four Georges have had their fair share of abuse in one way or another, though probably never in a more concentrated form than in this epigram:

"George the First was reckoned vile;
Viler, George the Second;
And what mortal ever heard
Any good of George the Third?
When from earth the Fourth descended,
God be praised, the Georges ended!"

A journalist with a statistical turn has found out that the London newspapers have contained in the last three years not less than one hundred and seventy-eight obituaries of Dr. Livingstone, the African explorer, any of which, he adds, is good enough for a man really dead.

A linguist at Warsaw, Poland, named Prescensky, has just completed a polyglot dictionary in twenty-three languages, upon which he has been at work for over seventeen years. It is believed that the Imperial Academy at St. Petersburg will publish the work at its expense.

"Long engagements," writes a young lady, "are going out of fashion, young men being at last convinced of the stupidity of making matrimonial proposals before they are in a position to fulfil their promise at once."

With all the boasted superiority of English railway management, more people were killed there in the last three months by railroad accidents than were killed in the United States from similar causes during the whole of the year 1870.

Robert Browning, although only fifty-eight years old, judged by his face might be thought seventy. Since the death of Mrs. Browning, he has grown old in appearance rapidly, although the vigor of his constitution is said to be unimpaired.

"George," asked the teacher of a Sunday-school class, "who, above all others, shall you wish first to see when you get to heaven?" With a face brightening up with anticipation, the little fellow shouted, "Gerliah!"

An Ohio inventor claims to have devised a process for converting iron into steel of so liquid a quality, that it can be cast into fine threads, ready-sharpened edge-tools, etc., all at one process.

A country journal having declared that during the carnival at Washington, "widows on the avenue were let for from twenty to fifty dollars each," explained the next day by saying, "windows, not widows, were meant."

The latest London blessing is called the digitarium—a small dumb piano. It is said that by means of it pupils can learn to play on all instruments keyed like the piano, without making a noise.

An old stager was compelled by his worthy spouse to "join the cold-water army," which he did, promising not to touch a drop of any thing except in sickness. He has never been well since.

Gail Hamilton thinks that the failure of women in practical business proceeds from her natural qualities and not from the obstacles she meets.

Harriet Martineau has written and published altogether not fewer, it is said, than three hundred volumes and pamphlets, nearly half of them since she was fifty years of age.

Caws and effect—Crows and scarecrows.

The *Medical Press* is discussing the possibility of a secret poison so deadly that the perusal of a letter containing some of it will cause the reader to fall dead, with all the symptoms of asphyxia.

It is claimed by Professor Swallow, engaged in the geological survey of Missouri, that there are larger trees in that State than in California; and he notes a sycamore that is forty-five feet in circumference.

The attempt of the young King of Greece to revive the Olympic games on the same spot and in the same style in which they were celebrated twenty-five centuries ago, has proved an ignominious failure.

The new King of Spain has introduced the greatest economy into his household, reducing the usual expenses to about one-fifth. This conduct of his is received very favorably by the tax-ridden Spaniards.

An Amsterdam journal says New York is so defiant of law, and so full of ruffians, that clergymen carry muskets to church, and that persons who bear around the contribution-box arm themselves with revolvers.

May not the appearance of a colored boy in the House of Representatives at Washington, in the capacity of page, be termed, without offence, "a dark page in American history?"

A young woman of Providence is said to be one of the best blacksmiths in that city. She works side by side with her father in his shop.

Bread is said to have been first made with yeast by the English about 1650.

The Museum.

OUR illustration this week represents Dr. Sternberg's invention of a Regulating Thermometer, by which electricity is made use of for the automatic regulation of dampers and

valves in stoves and furnaces, and the consequent regulation of the heat of rooms.

The construction of the Regulating Thermometer is shown in Figs. 1 and 2. Fig. 1 is a

thermometer for hanging in any room, the heat of which it is desired to regulate. A platinum wire is hermetically sealed in a portion of the tube prolonged below the bulb. An adjustable

wire slips through the open upper extremity of the thermometer stem, and its end is thrust down the tube. This wire passes between adjusting rollers, by which it is conveniently raised or lowered, until its end stands at any desired degree of the scale. By means of binding screws, the wires B and D have electric connection with the wires E and F, which pass to the furnace or heating apparatus, wherever it may be, and are there connected with the apparatus by which the valve or damper is operated. A battery-cup of any kind is interposed in the circuit at any convenient locality.

As soon as the heat of the room in which the thermometer hangs, causes the mercury to rise in its tube and meet the point of the adjustable wire, an electric circuit is completed, the current, passing through the helix of a temporary magnet, causes its armature to be attracted, moving a lever by which the valve or damper is closed. This closing of the damper causes the heat of the room to be diminished and the mercury to fall below the point of the wire in the thermometer tube. The electric circuit being thus broken, a spring draws the armature from the electro-magnet, and opens the damper. The damper or valve is thus regulated so as to keep the mercury in the thermometer tube oscillating at the point of the wire, and the temperature of the room is kept at very nearly a constant point.

Fig. 2 represents a thermometer especially constructed for immersion in any liquid which it is desired to keep at a fixed temperature. In this thermometer both wires are hermetically sealed in their places, the upper one being so adjusted that the mercury in the thermometer tube shall reach its extremity when subjected to the temperature to which the thermometer is designed to regulate any gas or liquid in which it may be immersed.

BY THE AUTHOR OF "VALERIE ATYLMER."

CHAPTER XXI.—MISS TRESHAM KEEPS HER WORD.

THE morning after the ball at Annesdale, Katharine was one of the few people who came down-stairs at the usual hour. Most of the ladies kept their chambers, and the gentlemen dropped into the breakfast-room at irregular intervals, looking the worse for their night's amusement. Miss Tresham received many compliments on her matutinal habits—all of which she answered by a faint smile. "I don't deserve any credit for my energy," she said. "I should have liked very much to sleep longer, and probably would have done so, if I had not been obliged to go to Tallahoma this morning."

Mrs. Annesley was sitting at another table and talking to quite another set of people; but she caught the last words and turned round.

"Did I hear you say something about Tallahoma, Miss Tresham? I hope you are not intending to desert us?"

"Not unless you prohibit my return," answered Katharine, smiling. "I was only talking of going into town for a while this morning—on business," she added, as she saw a slight expression of surprise on Mrs. Annesley's face.

"Hear! hear!" cried Mr. Langdon, laughing. "'On business'—that is, to buy six yards of ribbon, or a pair of gloves. How grandly you ladies talk!"

"To buy something much more important than many yards of ribbon, or many pairs of gloves," answered Miss Tresham, gravely. Then she turned to Mrs. Annesley, and asked if she could send her into town.

"Certainly. The carriage is at your service," her hostess replied. "At what hour shall I order it?"

"Immediately after breakfast, if you please," Katharine answered.

Immediately after breakfast, Miss Tresham went up-stairs, and put on her bonnet and cloak. When she came down, the carriage was standing before the door, and, while she was congratulating herself on her escape from companionship and questioning, lo! from the drawing-room, sallied forth Mrs. French arrayed in full out-door costume.

"You don't object to taking me along, do you, Miss Tresham?" she asked, with a smile that Katharine could not help thinking had the least possible tinge of malicious enjoyment in it. "Mamma wants me to go to the Andersons, and they live on the other side of Tallahoma. I can drop you in the village, and call for you as I return, if you say so."

Katharine said so with the best grace she could summon, and in this way found herself fairly booked to make the best or worst of Mrs. French during a five-miles' drive. For a while, the latter spared her any conversational exertion—being full of the important subject of the ball, on which her tongue ran as glibly as possible.

"Was it pleasant, Miss Tresham?—did you really enjoy yourself?" she asked. "Did other people seem to be enjoying themselves?" Of course everybody told me that it was delightful; but I have said such things dozens of times, when in fact I had been nearly bored to death. After one has told stories of that kind one's self, one isn't apt to believe other people, you know. I am so glad you think every thing went off nicely. Our ball has become quite the Christmas event in Lagrange, and I always like it to be nice. It often strikes me that it is a very daring thing to bring a hundred or so people together, and leave them to amuse themselves—for that is what a ball really comes to, you know."

"Indeed I don't know," said Katharine, smiling. "On the contrary, I think it is on the hostess that the success or failure of a ball principally rests. You must not try to shirk the success of yours, Mrs. French."

"Oh, it was mamma who played hostess," said Mrs. French, with a shrug. "I took no more responsibility of that sort than any of the guests. When I come home, I tried to forget that I am married; and I generally succeed in enjoying myself quite as much as if I was a girl with a dozen or so of admirers. By-the-by, we were talking over the

ball this morning, and there was quite a discussion going on as to who was the belle of it. Tell me who you think is best entitled to that distinction."

"That is hard to say," answered Katharine, trying to keep her wandering thoughts to the subject in question. "Everybody has a different opinion as to who was the belle of the ball. I think Miss Vernon was the most beautiful woman present; but whether other people thought so, or whether that constitutes bellehood, I really don't know."

"I should say that the woman who was most sought and admired was the belle," said Mrs. French, decidedly. "You were very much admired, Miss Tresham," she went on, with surprising candor. "Any number of people asked me who you were, and said you danced so gracefully. I suppose you learned to dance in Europe—in Paris, perhaps."

"Indeed, no," said Katharine, smiling and sighing both at once. "I never was in Paris. I learned to dance at home—in the West Indies—where everybody loves it so."

"But you are English."

"I am West Indian," said Katharine, flushing a little. "Please don't call me English, for I am no more English than you are. Your grandparents, or great-grandparents, probably came from England, and so did mine—that is all."

In this strain, the conversation went on until Tallahoma was in sight, and Katharine, instead of being fresh and ready for what was before her, felt already wearied and downcast.

"Where shall I tell John to stop, Miss Tresham?" asked Mrs. French, with her hand on the check-string, as they entered the town.

"At—" Katharine stopped a moment. She was about to say "Mrs. Marks," but a timely recollection of the lateness of the hour, and of the many detentions that would await her there, came over her. It was imperative that she should see Mr. Marks at once, and that the business which brought her to Tallahoma should be transacted without loss of time; so she finished her sentence by saying—"the bank."

"The bank, John," said Mrs. French, with a little arch of her eyebrows. Then she added, laughingly, "I must tell Mr. Langdon that your business in Tallahoma really was business. One doesn't go to a bank to buy ribbons and gloves."

"I am going to see Mr. Marks about my salary," said Katharine, more annoyed by this remark than was strictly reasonable, and thinking she would put an end to any and all conjectures concerning her business.

"My dear Miss Tresham," said Mrs. French, a little shocked, "I hope you don't think that I meant any thing—that I was so impertinent as to be curious about your affairs. I really beg your pardon, if I said any thing to make you think so."

"You did not say any thing," answered Katharine. "I ought to beg your pardon for mentioning them—only one certainly does not go to a bank to buy ribbons and gloves."

"This is the place now," said Mrs. French, looking out. "Shall I call for you here, Miss Tresham?"

"At Mrs. Marks's, if you please," said Katharine, as the footman opened the door, and she descended to the sidewalk. "I shall be back in about two hours," was the last thing she heard Mrs. French say, as the carriage drove off.

Watching it out of sight, the girl said: "Thank Heaven!" with fervor, then turned, and, opening a gate just before her, went up a short walk bordered with green box, to the door of a somewhat gloomy-looking brick house. She knew the place well, for, during her first year of residence with the Marks family, they had lived here; and it was only because the children were growing large, and the house, with the bank apartments deducted, was uncomfortably small, that they had removed to the outskirts of the village. Nobody was more glad of the change than Katharine; but still, her local attachments were strong, and she gave a kind smile round the yard, with every nook and corner of which she had been familiar. She even stopped a moment to examine a rose-bush, that was clambering over the porch, before she went in. The passage which she entered looked dark and cheerless, but, on a door to the right, the word "Bank" was conspicuously lettered; and, as this door was ajar, a large, well-lighted room, with a counter running across it, was visible. Here all was well-known ground; so Katharine walked in without any hesitation. Two gentlemen were standing at a fireplace behind the counter, and they

*Entered, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

both turned as she entered. One was Mr. Marks, the other Mr. Warwick. A young man was busy with accounts at the other end of the apartment.

"Why, Miss Kate, is it possible!" said the cashier, meeting her in his hearty way. He shook hands, and seemed so glad to see her, that Katharine, who was thoroughly unnerved, felt half-inclined to cry. It is astonishing how every emotion with a woman takes the form of that inclination. "Yes, it is I, Mr. Marks," she said; and, while she was making inquiries about Mrs. Marks and the children, Mr. Warwick, after speaking to her, took his departure. "I'll be back in the course of an hour," he said to Mr. Marks; and then he went out—looking, Katharine thought, a little more grave than was usual with him.

Her own business was soon transacted. If Mr. Marks felt any surprise at the demand she came to make, he had discretion enough not to show it. "The whole amount, Miss Kate?" was all that he said. "The whole amount, if you please, Mr. Marks," she answered. So, after due examination of accounts, and due adding up of interest, Katharine found no less a sum than one thousand dollars in crisp bank-notes, paid to her across the counter. Her heart gave a great leap. She had been so little accustomed to the command of money in her life, that this seemed to her a large amount—quite a moderate fortune, in fact. "Surely it will buy my freedom," she thought to herself, with a strange pang at her heart; and then, while she signed a receipt for the payment, a sudden thought occurred to her, and she startled Mr. Marks by dropping the pen, and looking up at him.

"Mr. Marks, I am sorry," she said, hastily, "but could you let me have the amount in gold?"

"In gold!" echoed Mr. Marks, so much astonished that he could not help showing it. "In gold, Miss Kate?"

"Yes—if it will not inconvenience you—if—"

"If it will not inconvenience you, my dear young lady," interrupted the cashier, laughing a little. "You'll find it rather troublesome, I think; but of course the bank is always ready to pay specie when demanded on its notes. Do you want all that money in gold?"

"All, if you please."

"I must go down into the vault for it, then. We don't keep specie up here," he added, smiling.

As Katharine stood waiting for him to return, she hurriedly reviewed the situation in her mind. Regarded in any light, it was a rather embarrassing one. To conceal a thousand dollars in gold about her person was simply impossible; to carry it in her hand through the streets, without exciting much observation, and incurring much fatigue, was equally impossible. Yet what was to be done? If she paid the bank-notes to St. John, he would certainly convert them immediately into specie; and, as the notes might readily be identified, this would subject her to a great deal of unpleasant conjecture and possible inquiry. The only way to avoid it was to draw the gold at once; and yet, in that case, the problem still remained—how was she to take the amount either to Mrs. Marks, or to Annesdale, being unfortunately unprovided with any convenient pocket or satchel? Necessity, however, is the best spur, not only to invention, but to fertile expedient. As Mr. Marks reentered the apartment, a solution for her difficulty flashed through Katharine's brain. She thanked him, after he had counted the last one of the ringing yellow pieces down before her; and, while he was methodically tying them up in a canvas bag, she asked, quickly:

"Mr. Marks, would you object to my seeing a friend in the parlor yonder, across the passage?"

"Certainly not, Miss Katharine," answered Mr. Marks, speaking without the least hesitation. "By all means, see a half-dozen friends there, if you desire."

"One will do," said Katharine, acknowledging this pleasantry by a faint smile. "Now one thing more—will you give me a pen and some paper?"

Pen and paper were obligingly placed before her; and she wrote a few lines, folded, sealed, and addressed the note to Mr. Henry Johns. As she was about to leave the room in search of a messenger, Mr. Marks spoke:

"If it's a note you want taken anywhere, Miss Kate, Hugh can go for you. He'll not be sorry for a walk," he said, nodding toward the clerk.

"If Mr. Ellis won't mind," said Katharine, looking at him with a smile.

The young man put down his pen, and came forward with an air which plainly showed that he did not mind. In shy, boyish fashion, he was quite an admirer of Miss Tresham, and she knew it.

"You are always ready to oblige me," she said, giving him the note, with a smile that almost turned his head. Then she followed him into the passage. "See the gentleman yourself, please," she said; and Hugh promised that he would.

After he was gone, she went into the unfurnished parlor, and walked up and down the floor, chinking the bag of gold which she kept whispering to herself would buy her freedom—at least, for the present. After a while, however, she found it heavy, and put it down on the window-sill, for tables or chairs there were none. Then, as she stood waiting, the forlorn aspect of every thing around began to strike her. Few things are more forlorn than an empty room—a room of bare floor, naked walls, uncurtained windows—and when, together with these things, the day is cloudy, and the prospect without not a whit more enlivening than the prospect within, it would take a very strong mind indeed to withstand the effect of time and place. Some people are peculiarly susceptible to influences like these, and Katharine was one of them. Those who knew her well thought she deserved a great deal of credit for being as quiet and full of practical common-sense as she generally proved herself; for she possessed in unfortunate degree that sensitiveness to outside events, that capability of being deeply affected by outside things, which sober, phlegmatic folk are fond of calling "nonsense." Engrossed as she now was by thoughts of the coming interview, she was not so engrossed but that she noticed at the time, and remembered afterward, every separate detail that went to make up the scene around her—every grotesque figure on the sickly green wall-paper, every cobweb across the dusty, fly-specked windows, every tree and shrub in the yard outside. She was looking at her watch, and thinking how fast time was going, when the click of the gate-latch made her start, and, looking up, she saw Hugh Ellis ushering in St. John.

As they entered the passage, she opened the parlor door, and motioned the latter to enter. When he obeyed, she closed it again, and, without speaking, walked to the window where the bag of money lay. Taking it in her hand, she turned and held it out as he approached.

"Here it is, St. John," she said. "I wish it was more, but, such as it is, you are welcome to it. Don't think that I grudge you one shilling when I say—will you go now and leave me in peace?"

"You think of nothing but yourself," said he, without touching the money. "From first to last, you have thought of nothing but yourself, and of being 'left in peace.' Yet, there are people who call women unselfish."

"If I think of myself, who forced me to do so?" said she. "St. John, don't let us recriminate now. Here is the money. Take it—believe me, you are welcome to it."

"As a price to get rid of me."

"No—as a relief freely given."

"It's a devilish mean thing to take it," said he. But still he did take it—opening his eyes a little at the amount.

"You must have been hoarding, Katharine," he said. "Or else they pay like princes here."

"They pay very well," she answered, "and I have not spent much. I have had no need to do so."

"What is the amount?"

"A thousand dollars. I took gold, because I thought you would prefer it to bank-notes."

"This is better," said he, a little absently. He weighed the bag in his hand, with an expert gesture. "Two hundred pounds sterling," said he. "Katharine, is it worth while to say that I am much obliged to you?"

"No—it is not worth while."

"Very well," said he, coolly.

He opened the bag, took out some of the coin and looked at it, put it back, and tied up the mouth again. Something slightly nervous in the action, struck Katharine; but, as he did not speak, she spoke herself.

"You will leave Tallahoma to-day, St. John?"

"No," said he, sharply. "Why should you think so?"

"I don't see what should detain you," she answered. "I—this is all I can do for you."

"I am not considering you," he said, coldly.

He turned and walked up and down the room, looking absently at the doors and windows as he passed.

"Is this rickety old place a bank?" he asked, after a while.

"Yes, it is a bank—that is, the bank is in the other room."

"Humph! They must offer a premium for feats of burglary."

"It is secure enough," Katharine answered—adding, suddenly, "St. John, don't waste time like this. Tell me what you mean by saying that you will not leave here."

"I mean that I have found work to do," he answered, coming back, and pausing before her. "I mean, Katharine, that I have found the thing I most need, and least hoped for—a claim on Fraser."

"A claim!—*here*!—St. John, are you mad?"

"If I am, it is the luckiest fit of madness that ever came to anybody," he replied, with a short laugh. "No, I am quite sane, and I tell you—"

"Hush!" said Katharine, catching his arm with a force that surprised him. "Hush!—what is that?"

They both stood quite silent, and listened—St. John full of astonishment, Katharine full of suspense. Through the closed door, there came the sound of a rustling dress and a woman's voice in the passage beyond. As soon as Miss Tresham heard this, she turned and glanced out of the window near by. To her dismay, the Annesley carriage stood before the gate.

"I must go," she said, hastily. "It is Mrs. French. St. John, don't keep me—I must go."

"Who is Mrs. French?" he asked, impatiently. "I want to see you—I want to speak to you about this business."

"I cannot stay now," she said; and, as she spoke, she moved rapidly across the room, and unclosed the door, just as there came a knock on the other side. Opening it suddenly, she faced Mrs. French, who was standing with her hand uplifted, ready to knock again.

"Oh, Miss Tresham," said she, rather taken aback. "I beg pardon—I hope I did not disturb you? The Andersons were not at home, so, thinking you might still be here, I called on my way to Mrs. Marks. Mr. Marks told me that you were in this room, and I merely wanted to let you know that I had come—I hope I did not disturb you."

"Not at all," said Katharine, perfectly conscious that, despite the obstacle of her figure, Mrs. French's eyes had fully explored the room, and fully scrutinized St. John, who was still standing near one of the windows, and immediately within her range of vision. "I am ready to go," she added. "Don't let me detain you."

"My time is quite at your service," said Mrs. French, with most obliging sweetness. "I can wait in the bank until you have finished your business."

"I have entirely finished it," answered Katharine.

In consequence of this reply, Mrs. French had no alternative but to turn from the door, and allow Miss Tresham an exit. As she walked down the passage, Katharine paused a moment, and motioned St. John to approach.

"If you are anxious to see me, you can come out to Annesdale," she said. "If what you have to say is important, you can meet me to-morrow in the place that I showed you before."

"At what hour?" he asked.

"I will try to be there by twelve," she answered, after which she closed the door, and followed Mrs. French.

"Shall I tell John to stop at Mrs. Marks's?" asked this lady, as she moved aside to let Katharine enter the carriage.

"I believe not," Miss Tresham answered. "I won't detain you. It does not matter, since I shall see Mrs. Marks in two or three days."

"Home, John," said Mrs. French, gathering her silk dress in both hands and stepping into the carriage.

Ten minutes after the equipage rolled out of sight, Mr. Warwick came down the street toward the bank. As he entered the gate, he met St. John, who was just going out. A glance only passed between the two men; but sometimes a glance can be very significant. The remembrance of the lawyer's keen eyes gave the adventurer an uncomfortable feeling as he walked along, with Katharine's thousand dollars safely stowed in his pockets, while Mr. Warwick went straight into the bank and asked Mr. Marks what "that man" had wanted there.

"That man!—whom do you mean?" inquired the cashier, in a tone of surprise.

"That St. John, or Johns, as I believe he calls himself—what did he come here for?"

"St. John!—Johns!—There has been nobody here of that name," said Mr. Marks, looking puzzled. "In fact, there has been nobody here at all since you left, excepting Mrs. French, who called for Miss Tresham."

"The gentleman Mr. Warwick means is the one Miss Tresham sent for," said Hugh Ellis, looking up. "I saw him as he went out of the gate."

"Miss Tresham sent for him?" repeated Mr. Warwick.

He said nothing more, but walked to one of the windows, and stood there for a minute gazing out. Then he turned and came back to his brother-in-law.

"Don't think I am meddling," he said, "but if it is not confidential, I should like to know what Miss Tresham's business was. Did she say anything to you about that man?"

"She said nothing about any man," replied Mr. Marks. "She came to draw her money."

"Her money!"

"The whole of her two-years' salary," said the cashier. "A very pretty little sum it was, too," he added, approvingly. "A thousand dollars down in gold."

"Why did you pay it in gold?"

"Because she requested it—from a foreigner's distrust of our paper, I suppose. I did not think of it before," he went on, "but it looks a little as if she meant to go away. If she did, I should be very sorry, for I don't know where I could find another teacher who would suit us all as she does. As for the man, I don't know any thing about him. She wrote a note, and sent it by Hugh; but he hadn't been here more than ten minutes before Mrs. French came."

"Did Miss Tresham go away then?"

"Yes, she went away then."

Mr. Marks paused a moment, looked at his brother-in-law, and added, hastily:

"I hope there's nothing wrong about the man, Warwick? It did not occur to me to think any thing—somehow I always feel as if Miss Tresham could be trusted as we don't trust every woman of her age."

"I am sure Miss Tresham can be trusted," said Mr. Warwick, quickly. "You don't suppose I was thinking of her? Whatever the man may be, there's one thing certain—she can be trusted."

"I am glad to hear you say so," responded Mr. Marks, looking relieved.

"Surely you did not need to hear me say so? Now, about my business. Mrs. Gordon asked me to get this check cashed for her. She wants the money at once."

CHAPTER XXII.—SPITFIRE PLAYS AT HIDE-AND-SEEK.

"MAMMA," said Mrs. French, entering the drawing-room where her mother was sitting with half a dozen ladies, "have you any idea where Miss Tresham is? We want to rehearse the *tableaux* for to-morrow evening, and she is not to be found."

"I saw her go to walk a little while ago," said Mrs. Annesley, looking up from her embroidery. "She went out toward the shrubbery, Adela. You had better send for her if you need her."

"Send Mr. Langdon," said Mrs. Raynor, laughing.

"I wouldn't advise you to do any thing of the kind, if you want to see either of them soon again," remarked Mrs. Dargan. "That young man is really absurd!" she added, with considerable asperity.

"Send Maggie Lester and Morton," said Mrs. Annesley. "Spitfire will soon find her for them."

"That is a good idea!" cried Mrs. French, and, by way of putting it into execution, she immediately returned to the library where the principal portion of the party were assembled. A lively examination of engravings, and discussion of costumes, was going on here, and a great deal of interest and excitement was afloat; for, thirty years ago, *tableaux* were by no means the very common and very boring amusement which they are at present. In those days they were quite novel, especially in country districts—and, in consequence of the novelty, were considered very fascinating. Not long before this, Mrs. French had assisted at an exhibition of the kind in Mobile, and she was anxious to introduce the new amusement into Lagrange. Having abundant material at hand, in the matter of pretty girls, obliging gentlemen, and

an unlimited command of costume, she determined on giving a New-Year entertainment of this character. All the company received the idea with enthusiasm, and the only danger was that their zeal might outrun their discretion, inasmuch as they seemed anxious to prolong the entertainment indefinitely by representing every conceivable scene, and personating every imaginable character within the range of history or fiction. At length, however, this vaulting ambition was somewhat curbed, and the programme, after much weeding, was finally made out. Of course, the usual trouble about the distribution of parts—the trouble which is the bane of private theatricals, and all affairs of the kind—ensued. But, by judicious management, the stormy waters were allayed, and, after many compromises, peace was at length secured. But only peace in partial form. Characters being settled, dress yet remained an open question; and, when Mrs. French entered the library, a warm discussion was in progress.

"I tell you it ought to be black velvet and pearls," Miss Lester was saying, decidedly, as her friend walked up and touched her on the shoulder.

"Let the black velvet alone just now, Maggie," she said. "I want you to go out into the grounds and look for Miss Tresham. Mamma says she went to walk. I wouldn't ask you, only you are so fond of exercise; and, if you take Spitfire, he will soon show you where she is. We must have her to settle about the dress of Queen Mary. Please take Morton with you, and see if you can't find her."

"Do you hear that, Mr. Annesley?" asked Miss Lester, who was ready at once for the part assigned her. "The morning is charming, and I should like nothing better than a walk. Spitfire will like a game of hide-and-seek, too. He will find Miss Tresham for you in no time, Adela. Meanwhile"—this to the lady to whom she had been talking before—"remember that I say black velvet and pearls."

Spitfire was quite willing for a walk and a game of hide-and-seek, while Morton, for his part, was heartily tired of talk about doublets, and ruffs, and colored lights, and gauze screens.

"Oh, we can't let Mr. Annesley go—we haven't settled on the costume of the Master of Ravenswood yet!" cried one or two ladies, as he rose with alacrity to follow Miss Lester from the room.

"He won't be long," said Adela, philosophically. "What do you think Lucy Ashton ought to wear?—a bridal dress, of course; but in what shape?"

"Which way shall we go, Miss Lester?" asked Morton, as they descended the front steps together.

"We will ask Spitfire that," the young lady answered. "Here, Spitfire!—seek, sir, seek! Find Miss Tresham—Oh, I forgot," as Spitfire stood looking very confused and irresolute. "I must have something of Miss Tresham's to show him. Mr. Annesley, run into the hall and see if you can't find me something."

Mr. Annesley did as he was bid—that is, he walked into the hall, and returned after a minute or two with a long crimson scarf. "I think this is Miss Tresham's," he said. "I have seen her wear it several times."

"Here, Spitfire, here!" said his mistress, shaking the scarf at him, as if she was a matadore and Spitfire was the bull she wished to enrage. "Smell it, pet—and now go and seek Miss Tresham."

Thanks to the instructions of "Cousin Tom," Spitfire was tolerably well trained. He sniffed at the scarf, then trotted about a little, sniffed at the ground in much the same disdainful fashion, and finally set off toward the shrubbery.

"Come on," said Miss Lester, beginning to walk very fast; and Morton came on, as requested. Fast walking is not the most graceful thing in the world, as we who live in this day have ample opportunity for observing; but, on the 31st of December, when the sun is clouded over, and the air decidedly sharp, it is at least a comfortable thing. Miss Lester's cheeks had bright roses in them when at last she came to a halt. "Where has Spitfire gone?" she cried, laughing. "I am afraid we shall have to look for him, without the advantage, which he has, of a nose as a guide."

"This way, I think," said Morton, and he turned down a path that led into the wildest and prettiest part of the grounds. The woods, which had been enclosed here, were left almost entirely as Nature arranged them, excepting that the encumbering undergrowth of the forest had been cleared away, and now and then a rustic seat was placed in some shady nook. In spring, summer, or autumn, a lovelier spot was not to be found within the borders of Lagrange; but it looked cheerless enough on this bleak December day, with the leafless trees stand-

ing out like fine pencil tracery against a dull, gray sky, and the brown earth covered only with dry, fallen leaves.

"I don't think Spitfire came this way," said Miss Lester, a little pettishly, for she did not fancy walking down a steep hill with the assured certainty that she would have to walk up again.

"I am sure he did," said Annesley; "but, if you are tired, we won't go on. No doubt he will bring Miss Tresham to us after a while. Here is a seat—pray sit down."

"No, we might as well go on. There!—is not that Spitfire that I hear?"

It was Spitfire, undoubtedly. From no other canine throat could such a volume of shrill sound have issued—a vehement barking, of the most indignant kind, that was borne with singular distinctness through the still air.

"He can't be attacking Miss Tresham in that way," said Morton, quickly.

"Oh, no," said Spitfire's mistress, with the coolness which characterizes the owners of bad dogs, when those dogs are annoying or terrifying other people within an inch of their lives. "He—he has met somebody else—somebody that he don't know. Let us walk faster," she went on, more eagerly, "or he may be hurt."

"The somebody may be hurt, do you mean?" asked Annesley, as he quickened his pace in accordance with her own. "Surely Spitfire will not really bite?"

"The somebody!" echoed the young lady, with an indignation that startled him. "You don't suppose I am thinking of the somebody—I mean that Spitfire himself may be hurt."

"Oh!" said the gentleman, thus enlightened—then he added, with a smile, "perhaps he may. I would not answer for what I might do under such provocation as that."

"That" was the furious sounds of rage to which Spitfire was giving utterance as they approached. Other sounds were also audible now—Katharine's voice calling him off, and a man's voice angrily bidding him be gone.

"Some one is with Miss Tresham," said Morton, stopping with an instinctive hesitation—an instinctive remembrance of that other meeting of which his mother had spoken two days before.

But he stopped too late. Urged by a fear for Spitfire's safety, Miss Lester rushed eagerly forward, and he could not decline to follow. A few more steps brought them into the little dell, of which mention has before been made, and there the combat was raging hotly—Spitfire barking fiercely, and making frantic dashes at the feet and legs of St. John, the latter defending himself with considerable bravery, and Katharine trying, by alternate persuasion and command, to draw off the assailant.

Upon this scene Miss Lester rushed, just as St. John lost patience, and, stooping, took up a stone. Before he could throw it, his arm was peremptorily caught.

"How dare you!" cried the indignant and breathless owner of Spitfire. "How dare"—a long pant—"dare you throw stones at my dog? I wonder you are not ashamed of yourself—a great big man like you to be afraid of a little dog like that!"

"Excuse me," stammered he, turning round in astonishment, and finding himself in the grasp of a young and pretty woman. "I did not mean to hurt him—but he attacked me without provocation, and"—he added, with a sudden effort to recover the self-possession that had escaped him—"though he be but little, he is fierce. You must confess that."

"How could you let him do it?" said Miss Lester, turning to Katharine, "and when Spitfire—poor, dear fellow—came out to look for you, too! But what is the matter?—are you not well?"

"Yes, I am well," said Katharine, trying to smile—a piteous attempt which touched Annesley—"but first Spitfire, and then you, startled me a little. I was not expecting any one."

"Adela sent us to look for you," said Miss Lester, turning her back on the gentleman, all the more determinedly because she was dying of curiosity to look at him. In her own fashion, she was a girl of very high-minded ideas, though; and she kept her eyes steadily fastened on Katharine's face. "Adela sent us for you. She wants to rehearse the *tableaux*, and you forget that you are Queen Mary and Joan of Arc."

"I did forget it entirely," said Katharine. "I will go back with you at once. Mr."—she paused a moment—"Mr. Johns, perhaps Mr. Annesley will be kind enough to show you the way out of the grounds."

"Certainly," said Mr. Annesley, with a grave bow, "unless you will permit me to suggest the amendment that you introduce me to your friend, and that he will do me the honor to return with us to the house."

Katharine cast a quick look of mingled apprehension and entreaty at St. John before going through the form of introduction, in a voice that was not quite steady. She might have spared herself the apprehension she entertained. St. John was equal to the occasion. He bowed with easy grace, and regretted that he could not accept Mr. Annesley's courteous invitation; then bowed again to the ladies, as Katharine said to Miss Lester, "Shall we return now?"

"With all my heart," the young lady answered. "Here, Spitfire! here pet! I am afraid to leave him there," she went on, as Katharine and herself mounted the hill. "He has evidently taken a great dislike to that gentleman, and, when Spitfire takes a dislike to anybody, he never gets over it. He—your friend—was about to hurt him when I came up."

"I think not," said Katharine. Then she added, suddenly: "Don't call him my friend. I know him, and he chanced to be here and meet me—that is all."

"You know him!" repeated Miss Lester, looking at her. "Excuse me, but you say that as if you did not like him."

"I don't like him."

"Then, if I were you," said the other, with sudden frankness, "I would not meet him in this sort of way. I wouldn't do it for a man I liked, and I am sure I would see a man I didn't like shot ten times over first. Don't think me impertinent, Miss Tresham," she went on, "but I like you, and I thought I would tell you how people consider such things here. You are a stranger, and perhaps don't know our customs. Of course, I shall not gossip about the matter, and, as for Morton Annesley, he is true as steel; but still, if I were you, I wouldn't do it. Are you offended with me?"

"Not in the least," said Katharine, smiling faintly. "You mean kindly, and, therefore, I could not be offended. You simply don't understand."

The last words were uttered so quietly, and with so much unconscious dignity, that they had their effect upon Miss Lester. She hesitated a minute before answering.

"No, I don't understand, of course, and I don't mean to judge either. But I can see how things look, Miss Tresham, and it was of looks that I was speaking."

"Yes, I know," said Katharine, absently.

Meanwhile Morton and the companion who had been presented to him were crossing the grounds to the side-gate through which St. John had entered. A few commonplace remarks about the weather were interchanged as they proceeded; but, when they reached the gate, instead of opening it, Annesley stopped and faced the other.

"Excuse me, Mr. Johns," he said, gravely, "if I ask leave to speak a few words before we part. Of course, I do not know why you preferred to see Miss Tresham in the grounds, but permit me to remind you that the house is only a short distance from the place where I met you, and that any one of Miss Tresham's friends is cordially welcome there."

"It was by Miss Tresham's own request that I met her where I did," answered St. John, coldly. "I will bid you good-morning, with the assurance that I shall not invade your domain again."

"I hope you understand that it was on Miss Tresham's account that I spoke," said Morton, flushing a little.

The other lifted his hat with a courtesy so ceremonious that it had not a little of mockery in it.

"In Miss Tresham's name, allow me to thank you," he answered. "The only thing that puzzles me is the cause of this kind solicitude."

"Miss Tresham is one of my mother's guests," said Annesley, with a good deal of unconscious *hauteur*. He opened the gate, and raised his own hat, as St. John passed through. Nothing more was said on either side. They parted with a couple of stiff bows that would have become a pair of duellists; and, as St. John strode away in the direction of Tallahoma, Annesley went back to the house.

When he entered the hall he was at once waylaid by Mr. Langdon, and marched *nolens volens* into the back drawing-room, where a rehearsal was going on.

"No mutiny, young man," said the latter, as Morton tried to get

away on a pretext of business. "I was sent in search of you, and it is as much as my life is worth to go back without you. Queen Adela is *regnant* just now, and she would think nothing of ordering my head to be taken off for disobedience of orders. In with you!"

He gave his captive no time for expostulation, but ushered him straight into the room where the stage of Christmas Eve was again erected. Strangely enough the two women whom Morton had last seen together in the grounds were the first on whom his eye fell as he entered.

They were now confronting each other in tragic attitude—Miss Lester as Queen Elizabeth, Katharine as Queen Mary, in the famous scene from Schiller's "Marie Stuart."

In these days all the world knows that scene, for all the world has seen Ristori act it. But then it was something new, and something for which the world of Lagrange was indebted to Morton Annesley. He, knowing and admiring Schiller with all the enthusiasm of a German student, had suggested the picture, and given his opinion concerning a proper selection of the characters.

"Maggie Lester would do for an immensely-flattered Queen Elizabeth," he said, laughing. "She can't deny that her hair is red. And, if you were to put a Marie-Stuart coif and curls on Miss Tresham, I am sure she would look like the Queen of Scots. The color of her hair and the cast of her features are not unlike the portraits of the royal beauty."

When he came in just now poor Queen Mary was thinking of any thing else but her cowering rival or her deadly wrongs. She saw him enter, and, though she could not turn her head, she shot a wistful glance out of the corners of her eyes which Mrs. French caught as well as himself.

This astute lady had made nothing of Maggie Lester's reserve and self-possession. But a look at her brother's face told her all that she wanted to know.

"He has seen him!" she thought; and the knowledge acted on her like a stimulant, enlivening her spirits as if by magic.

After that the *tableaux* went on bravely, for everybody was held well in hand by their fair ruler, and nobody ventured on any open signs of weariness or dissatisfaction.

It was not until the rehearsal ended, and most of the company had dispersed to dress for dinner, that Katharine found an opportunity of speaking to Morton. He was standing near the stage, directing the servants, who were arranging some of the decorations, when she walked up to him.

"Mr. Annesley," she said, hurriedly, "I should like to speak to you. I have something to say to you. May I say it now?"

"Certainly," he answered, turning at the first sound of her voice. "Shall we go into the library?"

"No, it is only a few words. If you will come here—"

She walked away, and he followed her. Every one, excepting the servants, had now left the room. On one side was a bay-window, and into this Katharine went.

"It is only a few words," she repeated, as Annesley followed her; "but I should not like for any one to hear them."

"There is no danger of any one's doing so here," he answered.

Then he was silent, waiting for her to speak. After a minute she began, with a nervous haste of manner that had grown habitual with her of late.

"It is not about myself, Mr. Annesley. It is about Mrs. Gordon. I know that you are much attached to her, and—and I thought I would tell you, so that perhaps you might be of service to her. She is threatened, if not with danger, at least with serious annoyance."

Now, this was the last sort of communication which Morton could possibly have expected to hear, and the surprise which he naturally felt showed itself at once in his face and manner.

"Mrs. Gordon threatened with serious annoyance!" he repeated, with a start. "Pardon me, but you must be mistaken. There is no one who would dare—"

"There is some one who has the right to dare," she interposed, hastily. "Believe me, I know what I am saying. She is certainly threatened with very serious annoyance and distress."

A sudden dark flush rose over his face, and he frowned as Katharine had never seen him frown before. She recognized then what many other people had recognized before, that to touch Mrs. Gordon was to assail him in one of his most sensitive points.

"By whom, and in what way?" he asked.

"I cannot tell you that. I would if it were my secret; but it is not mine—it is Mrs. Gordon's. It came to my knowledge accidentally, and I cannot repeat it. Go to her, and, if she wishes you to serve her, she will tell you herself. I—I am very sorry for her," said the girl, with tears coming into her eyes. "She has a hard lot. I wish I could help her. Perhaps you can, Mr. Annesley—you are a man."

"I will try, at least," he said. "Shall I—would you advise me to go at once?"

"At once."

He moved away a few steps, turned abruptly, and came back.

"Miss Tresham," he said, quickly, "is there nothing I can do for yourself?"

She knew what he meant. She knew that he would not ask her confidence, or seem to request an explanation of the events of that morning. But she also knew that he gave her an opportunity—perhaps a last one—to right herself in his eyes. Some instinct told her that much hung on her reply, and she gave a slight gasp over it.

"Nothing, Mr. Annesley."

"I am sorry for that," he said.

Then, as if afraid to trust himself to speak another word, he walked away.

In the hall he met his mother.

"Where are you going, Morton?" she asked, as she saw him take his gloves and riding-whip from the stand. "Don't you know that dinner is nearly ready?"

"I shall not be back to dinner," he answered. "Make my apologies, if you please, mother, and say that important business called me away."

"Why, where are you going?"

"I will tell you when I come back. I have not time to talk now."

"But, Morton—"

She spoke in vain. Morton was gone. When she followed him to the door he was walking rapidly in the direction of the stables, and, not long afterward, she saw him, from her chamber window, canter away in the direction of Tallahoma.

It was not to Tallahoma that he was bound, however. The last sun of the Old Year had given a few golden gleams, and was sinking to rest in a bed of soft, violet cloud, when he dismounted from *Il-derim* before the door of Morton House. Rapidly as he had ridden, he noticed along the avenue the fresh track of carriage-wheels, and the fact puzzled him a little. Mrs. Gordon never left home, and nobody ever came to the house. At an ordinary time he might merely have thought that one of these rules had been broken; but now, with the remembrance of Katharine's vague warning in his mind, he felt an uncomfortable foreboding of ill. This foreboding was increased as he approached the terrace and saw a group of negroes loitering with sorrowful faces around the steps.

"What is the matter?" he asked, as one of them came forward and took his horse. "Has any thing happened that you all look as if you had been to a funeral?"

"Mar's Felix is gone, sir," answered the boy addressed, in a tone which indicated that he thought this a sufficient reason for any length of visage.

"Felix!—gone!—" Annesley repeated. A sudden fear, common enough in that country and at that time, startled him. "Do you mean that he is lost?"

"Oh, no, sir," answered the boy, quickly. "Mr. Warwick came and took him away in a carriage. They hadn't left more'n a few minutes before you got here, sir."

"Did his mother—did your mistress go too?"

"No, sir—she's in the house."

"Very well. Keep my horse here. I shall be back directly."

He walked hastily to the house, and on the portico met Harrison, who was wearing a most lugubrious face.

"What is the meaning of this, Harrison?" Morton asked, quickly.

"Where has Felix gone?—and why has he been sent away?"

"The Lord only knows, Mass Morton," said the old man, dolefully. "Miss Pauline and Mr. Warwick done it. I don't think they asked anybody's advice, sir—they just packed up Mass Felix's clothes, and took him right away. It was hard on the poor child, sir, for he didn't want to go; and if you could a-heard him a-crying, sir, it would almost a-broke your heart."

"I am glad I didn't hear him then," said Morton, who saw plain-

ly that the whole feeling of the household was ranged on Felix's side. "But his mother must have had some good reason for sending him away. Where is she?"

"In her own room, Mass Morton," answered Harrison, following the young man into the house. "You better go into the drawing-room, sir, and I'll ask if Miss Pauline can see you. I don't mean to blame Miss Pauline," he added, with an air of severe justice. "To be sure she must a had her reasons unbeknownst to the rest of us. But it was hard on Mass Felix—and him so young."

"A great many things are hard," said Morton, "but they must be done. Send Babette to ask my cousin if she will see me."

In a few minutes, Babette entered the room, and said that Mrs. Gordon would see him. The Frenchwoman's eyes were red with weeping, and her face was sadly swollen from the same cause. Morton felt sorry for her, and said so—at which she startled him by a fresh burst of tears.

"Ah, madame—poor madame!" cried she. "M'sieur, comfort her, if you can. She is heart-broken—she will die of grief, if she is not comforted."

"I will do my best," said he; "but if Felix is gone, I fear that will not be much. Cheer up, Babette! Surely he will be back before long."

"Le bon Dieu only knows," answered Babette. And, as he crossed the hall, he heard her sobbing behind him.

Poor Morton! There is no exaggeration in saying that he would sooner have faced any danger which could possibly be imagined, than the scene which fancy painted as awaiting him in Mrs. Gordon's room. The sobs, the tears—Babette's noisy grief was, of course, only a faint shadow of what the bereaved mother must feel. He set his teeth, as he laid his hand on the door-knob—then turned it, and entered.

All was quiet within. On the hearth the fire burned, outside the windows, a soft, sad requiem of the dying year was moaning through the tall trees; but no human sob or sigh was borne to Annesley's ear. A figure clad in black sat on one side of the fireplace, and held out her hand as he advanced.

"Come in," said Mrs. Gordon, quietly. "You are very welcome. Is it not cold? Draw nearer the fire. Well"—with a faint, mournful smile—"have you heard the news? I am desolate."

"I have heard it," he answered.

He could say no more; for, although he ought to have been relieved, he was, in truth, more deeply affected by her quietude than he could have been by any vehement outbreak whatever. The hopeless accent of the last words went straight to his heart, and touched it more than tears could have done. He said nothing; but he kept her hand tightly clasped in his for several minutes.

"I see you feel for me," she said—"you do not think it is foolish to mind it so."

"No words can say how much I feel for you," he answered.

"It might be foolish, perhaps," she went on, "if he was not my all. But he is, you know—literally every thing that I have on earth."

"But surely you have not sent him far—surely he will not be gone long?" said Morton, unable to contain his surprise.

"I do not know where he has gone," she answered, in the same quiet, hopeless tone; "and I do not know when I shall see him again—perhaps never."

Annesley said, "Good Heavens!"—and then he stopped. A sudden remembrance of Katharine's words and looks came to him. "It is Mrs. Gordon's secret," she had said. "If she wishes you to serve her, she will tell it to you." Here was the secret staring him in the face; and evidently it had been told not to him, but to John Warwick. For a moment, he felt wounded—more deeply wounded than it is possible to describe; but, almost immediately, cooler reason and better feeling triumphed.

"Whatever you have done, I am sure you have done well," he said, in his kind, loyal voice. "Whatever is to be borne, I am sure you will bear well. This is no time for reproaches, but I cannot help asking you why you forgot that I am your kinsman, and ready to do any service for you."

"I did not forget it," said she, holding out again the hand he had relinquished. "Morton, don't reproach me—for that is reproach. After Felix, there is no one so near my heart as you are—both for your own and your father's sake. If I did not ask this service of you, it was only because you were not in a position to render it. Circumstances made it necessary that Felix should be taken away—

far away, where even I might not know where he is—and you had not the requisite time for this.”

“I would have taken the time.”

“I don’t doubt that—but I could not ask it. Besides, I went to John Warwick, as a lawyer, and he advised me as a lawyer, before he served me as a friend.”

“I could not have advised you, perhaps; but I would have served you against any thing—or anybody.”

“There are some things one can only fight with cunning, not with force,” said she—adding, after a moment, “I will tell you every thing if you will remember that I tell it only to you—not to Lagrange, or to anybody in Lagrange. Yet that is a foolish remnant of the old pride, for everybody will know it soon.”

“Consult your own feelings, not mine,” said he. “If it is painful to you to speak, don’t do it. I will serve you ignorantly as readily as with knowledge. Don’t—don’t distress yourself.”

“You deserve confidence from me,” said she, “and you shall have it.”

Then, as if it were a relief—and, indeed, after a fashion, it was a relief—she began and poured forth her pitiful story, going far more into detail than she had done in speaking to John Warwick, and eliciting far more of warm, outspoken sympathy. What the lawyer felt he had shown in deeds, not words; what Morton felt burst forth in eager language, though it would have been equally ready to prove itself by acts. The difference was less in the different natures of the two men than in their different ages.

As Mrs. Gordon went on, Morton’s interest grew warmer, until suddenly there came a cold chill. It would be hard to say what the young man felt when she first spoke of St. John, and an instinct—a sharp convulsion at his heart—told him that this St. John was one and the same with the “Mr. Johns” whom Katharine Tresham had that morning asked him to show out of the grounds of Annesdale. Then, the warning she had given him, the knowledge which she possessed of this carefully-guarded secret—he grew suddenly faint and sick, and turned so pale that Mrs. Gordon noticed it.

“What is the matter?” she asked. “You are thinking of something besides me.”

“I am thinking of this St. John,” he answered. “Don’t you think that he may have come here accidentally—not in search of you, after all?”

“Babette thinks so; but I cannot believe it. However much he may pretend otherwise, I am sure he came here in search of me.”

“But how did he know that you were here?”

“I cannot tell that.”

Morton said no more. He would have cut out his tongue sooner than mention Katharine’s name in the matter; and, although he did not know it, Mr. Warwick had been equally discreet. Mrs. Gordon had not a suspicion that St. John was connected with any one in Lagrange besides herself. Different as the two men were, they had something in common, which they proved by this reticence. Morton was right when he once told Felix that the grand test of a gentleman is the capability of being trusted; and he might have added that it is not only the capability of being loyal to a trust which has been solemnly and explicitly given, but it is also to be found in that fine sense of honor which can appreciate tacit confidence, and respect the secret for which no secrecy has been asked.

When Annesley rode away from Morton House, the last day of the Old Year had died the death common to all things mortal. The last gleam of light had faded in the west; the night hung over all things with its sombre mantle; the stars gleamed with an uncertain fitfulness through a curtain of misty cloud; and even the lights from the wayside houses looked, to the young man’s fancy, more dull and red than cheery and bright. As he rode forward, his heart was strangely heavy, his mind strangely disturbed, and, in a sort of accompaniment to the thoughts that tormented him, a certain verse of a poem he had seen shortly before kept running through his brain. Almost unconsciously, as he looked at the great hosts of Night that were marching steadily forward to the death-bed of the Old Year, he caught himself repeating:

“He lieth still; he doth not move;
He will not see the dawn of day.
He hath no other life above.
He gave me a friend and a true true-love,
And the New Year will take them away.”

[TO BE CONTINUED.]

LAURELLA.

FROM THE GERMAN OF PAUL HEYSE.

THE sun has not yet risen above the horizon. Over Vesuvius there hangs a broad, gray stratum of fog, that stretches across as far as Naples, and obscures the small towns scattered along the shore. The sea is calm. At the mouth of a small creek, in a little harbor enclosed by the Sorrento Cliffs, fishermen and their wives are already at work drawing their skiffs to land, with the nets that have been set during the night. Others are occupied getting their boats ready for sea—setting their sails, shipping their rudders, and bringing oars and tackle from the grated vaults, built in the cliffs for the protection of their property at night. There are no idlers; even the aged, who no longer go out to sea, fall into the line, and help to draw the nets to shore. Here and there may be seen an old woman, spinning on the flat house-tops, or busy with her grandchildren, while their mother assists her husband.

“Do you see, Rachela?—there is our good Padre Curato,” said one of the old women to a child of ten years that stood beside her. “See—he is just getting into Antonio’s boat to be rowed over to Capri. Maria Santissima! but how sleepy the reverend signor looks!” And she waved her hand to a benevolent-looking little priest, who was making himself comfortable in a row-boat that lay at the mouth of the creek. The others on the shore stopped work to see their pastor start off, an attention to which he responded by many a kindly nod.

“Why must he go to Capri, grandmother?” asked the child. “Have the people over there no pastor, that they must borrow ours?”

“Don’t be so foolish!” chid the old woman; “they have priests enough, and the most beautiful churches, and even a hermit, which we have not. But there is a great signora over there, who used to live here in Sorrento, where she was once so ill that our padre had to go to her very often, for they thought every day would be her last; and still, thanks to the Holy Virgin, she got quite well, and was able to bathe in the sea again. When she went over to Capri, she gave a big pile of ducats to the Church and the poor; and she did not want to go, they say, until our padre promised to go over there, that she might confess to him as before. It is wonderful how much she thinks of him. We may be very proud to have a curate who has learning enough for a bishop, and is so beloved by all the great folks. May the Holy Virgin have him in her keeping!” she exclaimed, and waved her hand to the little boat as it was about to put from shore.

“Shall we have clear weather, my son?” asked the little priest, with a doubtful look toward Naples.

“When the sun rises, that little cloud of fog will soon disappear,” replied the young boatman.

“Well, then, let us be off, so that we may get over before it gets hot.”

Antonio picked up an oar, and was about to push off the boat, when he paused suddenly, and fixed his eyes on the steep path that leads down from the Sorrento Cliffs to the water.

A lithe female figure was visible at the summit of the heights; she waved her handkerchief, and was making all possible haste to descend the stony path. Under her arm she carried a small bundle, and her dress was of the plainest description. Still there was an almost distinguished air about the girl, and that, too, in spite of a wild, defiant way she had of carrying her head, which was adorned with a profusion of dark tresses that she wore tastefully wound round her forehead like a diadem.

“What are you waiting for?” inquired the curate.

“There is some one coming up there that wants to go to Capri—with your permission, padre. We shall not go any slower; for it’s only a slight young girl, scarcely eighteen.”

At this moment the girl appeared from behind the wall that borders the winding path.

“Laurella!” cried the padre. “What has she to do over in Capri?”

Antonio replied with a shrug. The girl, without looking to the right or the left, hastened toward the boat.

“Good-morning, la Rabbiate!” shouted several of the young boatmen. They doubtless would have added more, but for the presence of the curate; for the silent defiance with which the girl received their salutations seemed to tempt the more wanton of them.

"Good-morning, Laurella!" greeted the priest. "Are you going with us to Capri?"

"If I am allowed to, padre."

"Ask Antonio; he is master here. Every man is master—at least, he should be—of his own, as God is the master of us all."

"There is half a carline," said Laurella, without looking at the young boatman—"if I may go for that."

"You have more use for it than I have," muttered the young man, pushing aside some baskets of oranges to make room. He was to sell them in Capri, for the little rocky island does not grow enough for its numerous visitors.

"I will not go for nothing," answered the girl, wrinkling her dark eyebrows.

"Come, come, child," interposed the curate; "he is a good lad, and will not enrich himself from your poverty. Come, step in"—and he reached her his hand—"and sit down here by me. See there! he has spread out his jacket to make a soft seat for you. He did not take so much trouble for me. The young fellows are all alike: for one little maiden they will put themselves out more than for a dozen of us reverend fathers.—Nay, you need not excuse yourself, Tonino—throughout all Nature, like seeks like."

Laurella meanwhile had stepped into the boat, and seated herself beside the padre—first, however, pushing the jacket aside without saying a word. Antonio let it lie, and, muttering something, he pushed vigorously against the pier. The boat sped out into the bay.

"What have you in your bundle?" asked the padre, as they rowed on over the calm sea, that was beginning to be lighted by the rising sun.

"Some silk, some yarn, and a loaf of bread, padre. I am going to sell the silk to a woman who makes ribbons, and the yarn to another."

"Is it of your own spinning?"

"Yes, padre."

"If I remember rightly, you have also learned to weave ribbons?"

"Yes; but mother is so much worse lately that I cannot leave her alone, and we are not able, you know, to buy a loom for ourselves."

"She is worse? I am sorry to hear it. When I called at Easter, she was better than usual."

"She is always worse in the spring; and, since the severe storms and the earthquakes we have had, she has been confined to her bed."

"Do not neglect to pray, my child, that the Holy Virgin may intercede for you. And be good and industrious, that your prayers may be heard.—When you were coming toward the boat, they called out, 'Good-morning, la Rabbia!' to you," continued the curate, after a pause. "Why do they call you so? It is not a nice name for a Christian girl, who should be gentle and humble."

Laurella's olive face became crimson, and her eyes flashed fire.

"They are always jeering at me, because I do not dance and sing and gossip with them. I think they might let me go my way in peace. I never interfere with them."

"But you should be friendly toward every one. Let those dance and sing on whom life sits lighter. A kind word becomes those even who are most sorely tried."

She looked down and drew her eyebrows nearer together, as though she would hide her large dark eyes beneath them. For a while they rowed on in silence. The sun had now risen resplendent above the mountains. The summit of Vesuvius still towered above the clouds that hung around its base, and on the plains of Sorrento the white cottages gleamed amid the verdant orange-groves.

"Have you heard nothing more from the painter, Laurella—I mean the Neapolitan who wanted you to be his wife?" asked the curate.

She shook her head.

"Why did you refuse him when he came to paint your portrait?"

"What did he want of it? There are prettier girls than I am; and, then, who knows what he would have done with it? He might have bewitched me with it, mother said."

"You must not believe such foolish things," said the padre, seriously. "Are you not always in God's keeping, without whose knowledge not one hair of your head can fall? And shall a poor, weak mortal, with such a picture in his hand, prevail against the

Lord? Besides, you might have seen that he wished you well. Would he otherwise have wished to marry you?"

She was silent.

"Why did you refuse him? He was a worthy young man, they say, and handsome and talented, too. He would have provided for you and your invalid mother far better than your spinning will ever provide for you."

"We are so poor, and mother will probably never be much better!" said she, feelingly. "We should only have been a burden to him, and then I should never do for a signora. When his friends came to see him, he would have been ashamed of me."

"What nonsense you do talk, my child! I tell you the man meant well with you. What better proof could you have had than his offer to come and live in Sorrento?"

"I want no husband—never shall!" said she, obstinately, half to herself.

"Is this a vow you have made, or do you think of becoming a nun?"

She shook her head.

"The people who accuse you of being obstinate are, I fear, not altogether wrong. Do you ever reflect that you are alone in the world, and that your perverseness must still further embitter the life of your sick mother? And what good reason have you for refusing a loving hand that would find its greatest happiness in aiding you in your necessities? Tell me, my daughter."

"I have a reason—a good reason, I think—but I had rather not tell what it is," said she, in a low, hesitating tone.

"Not tell what it is! Not to me, your confessor? Am I not your friend?"

Laurella nodded an affirmative.

"Then, child, unburden your heart. If you are right, you may be sure I shall be one of the first to uphold you; but you are young, and know little of the world. The time may come when you will regret having allowed some girlish fancy to stand in the way of your happiness."

She glanced modestly at the young man, who sat at the other end of the boat rowing away vigorously, his woollen cap pulled down over his eyes. He gazed into the distance, and seemed to be absorbed in his own meditations. Her glance did not escape the padre's notice, and he leaned his head closer.

"You did not know my father," she whispered, and a frown clouded her handsome features.

"Your father? He died when you were scarcely ten years old, I think. What can your father have to do with your present perversity?"

"You did not know father. You do not know that he alone was the cause of my mother's illness."

"How so?"

"He misused her, beat her, trampled upon her. How well I remember the nights when he came home in fits of frenzy—when nothing did or could please him! She never said a word, and always did all he bade her, and yet he would beat her till I thought my heart would break. At such times I used to draw the covering over my head and pretend to be asleep, but I cried all night; and then, when he saw her lying on the floor, he would suddenly become compassionate, and raise her up, and almost smother her with kisses. Mother forbade my ever telling of this, but it so injured her constitution that, during all these long years since father died, she has been an invalid. And should she soon die—which may Heaven forbid!—I shall know what it was that killed her."

The little curate shook his head thoughtfully, and seemed undecided what reply he should make. After a pause, he said:

"But you must forgive him, my daughter, as your mother has forgiven him. Let us hope that there are happier days in store for you than you have ever known! You should try to forget these sad scenes."

"Forget them! I never can," said she, with a shudder. "This is the reason, padre, why I am resolved never to marry; I will not be subject to a man who might misuse me. Were a man to want to beat or to kiss me now, I would defend myself, but mother could not, because she loved my father, unkind as he was to her. Now, I will never love any man so as to tamely suffer him to abuse me and to be made ill by him."

"You are a child, and you talk like a child that knows noth-

ing of life. Are all men like your poor father, who, it seems, had never learned to curb his temper, and ill-treated your mother? Do you not see kind and just men enough in the neighborhood—men with whom their wives are happy and contented?"

"But no one knew how my father treated my mother. She would have died sooner than complain, and all because she loved him. If this is love—if love closes our lips when we should cry out for help—if it makes us meekly suffer wrongs greater even than our worst enemy could do us, then I say I want nothing to do with love."

"I tell you that you are a child, and know nothing of such matters. When the time comes, your heart will not ask your little obstinate head whether it shall love or not—then all your resolutions will be of little avail." After a pause, he continued: "And the painter—did you fear that he would be unkind to you?"

"He looked sometimes just as my father used to look when he took my mother in his arms and begged her pardon. I know those eyes; they are no proof that a man will not beat his wife, although she may be a saint or an angel. It always makes my flesh crawl to see such eyes."

The curate thought of more than one wise saying with which he might have admonished the girl, but he was silent on account of the young boatman, who began to be more inclined to listen to what passed between his passengers.

After two hours' rowing they reached the little port of Capri. Antonio took the padre in his arms and carried him through the shallow water of the landing to the shore; but, before he could return for Laurella, she followed them, holding up her scanty skirts with one hand, and carrying her bundle and her wooden shoes with the other.

"I shall remain some time in Capri," said the curate. "You need not wait. I may not return till to-morrow. When you get home, Laurella, remember me to your mother. I will come to see you in the course of the week. You mean to go back, I suppose, before dark?"

"If I get an opportunity," answered Laurella, busying herself with adjusting her dress.

"You know that I, too, must be back in good season," said Antonio, in what he thought was a tone of great indifference. "I will wait for you till Ave Maria; if you are not here by that time, I shall go without you."

"You must try to be here in time," said the little padre. "It would never do for you to leave your mother alone all night. Is it far you have to go?"

"To a vineyard near Anacapri."

"I go in the direction of Capri. God bless you, my daughter, and you, my son."

Laurella kissed his hand, and said one good-by to be divided between the padre and Antonio. The latter, however, seemed little inclined to appropriate his share; he raised his cap to the padre, but did not even look Laurella's way.

But, after they had turned their backs, he let his eyes follow the padre only a short distance, as he toiled over the deep bed of small loose stones; he soon turned them toward Laurella, who had gone to the right, and now began to ascend the heights, holding one hand over her eyes to protect them from the burning sun.

Toward the summit, where the path disappeared behind a wall, she paused, as if to take breath and look around. The rugged rocks rose high around her, below lay the little harbor, while beyond shone the sea in all the splendor of its deepest blue. The scene would well repay a moment's pause. It happened that, in glancing past Antonio's boat, she caught his eye. They both started, as people do who would excuse themselves for some inadvertency, and then Laurella, with one of her darkest frowns, went her way.

It was only an hour after mid-day, and yet Antonio had already been sitting full two hours on the bench in front of the Fishermen's Tavern. He must have been anxiously waiting for some one, for every few minutes he would jump up and go out into the sun to look up the two roads which, parting right and left, led to the two little towns on the island. He did not altogether like the appearance of the weather, he said to the hostess of the little tavern. True it was clear enough, but the peculiar tint of the heavens and the sea was ominous.

It looked just so, he said, before the last great storm, when he had

such difficulty in reaching land with the English family. "You must remember it," he added.

No, she did not, replied the woman.

"Well, if the weather changes before night, you will remember me," said he.

"Have you many fine folk over at Sorrento?" she asked, after a pause.

"They are only beginning to come. The season has been very dull thus far. Those who came to bathe came late."

"It was such a late spring! Have you not been making more than we here at Capri?"

"I should not have made enough to give me macaroni twice a week," replied Antonio, "if I had depended wholly on the boat. Now and then a letter to carry to Naples, or a gentleman to row out fishing, that was all. But you know I have a rich old uncle, who owns more than one fine orange-grove. 'Tonino,' says he, 'so long as I live you shall not want, and at my death you will find I have provided for you.' So, with God's help, I managed to get through the winter very comfortably."

"Has your uncle any children?"

"No, he has never been married. He lived long in foreign parts, where he laid aside many a good piastre. He is about to start a large fishery, and is going to put me in charge of it."

"Why, then you are a made man, Antonio."

The young boatman shrugged his shoulders.

"Every man has his own burden to carry," said he.

Again he went out and looked anxiously right and left, although he must have known that there was but one weather side.

"I will bring you another bottle," said the hostess. "Your uncle can afford to pay for it."

"Only one glass more. Your Capri wine is too fiery. My head is hot already."

"It does not heat the blood. You can drink as much as you like of it. And here comes my husband; you must sit a while and chat with him."

And, sure enough, there came the stalwart host of the little tavern, with his fish-net over his shoulder, and his red cap pulled down low over his curly head. He had been to carry some fish to the great lady whom the little Sorrento curate had gone to visit. When he saw the young boatman he waved him a welcome. Then, after throwing his net aside, he came and sat beside him on the bench. Just as the hostess appeared with a second bottle of genuine Capri, Laurella came down the road from Anacapri. She nodded modestly, and then stopped, apparently embarrassed.

Antonio sprang to his feet.

"I must go," said he; "this is a young girl from Sorrento who came over with the Signor Curato this morning. She must be home with her sick mother before night."

"Well, it's a long time yet till night," interposed the host. "She will have time to drink a glass of wine with us.—Ho, wife, bring another glass!"

"I thank you, I do not care for any," said Laurella, and remained standing at a distance.

"Fill her glass, wife, fill her glass; she must drink with us!"

"Don't urge her," interposed Antonio. "She has a head of her own; a saint could not persuade her to do what she does not want to do." And, taking a hasty leave, he ran down to his boat, loosened the painter, and stood waiting for Laurella, who nodded a good-by to the hostess, and followed with ill-concealed reluctance. She looked around as though she hoped to see some other passenger, but the strand was deserted. The fishermen were asleep, or were rowing about the shore with their rods and nets, a few women and children sat before the doors of the cottages either asleep or spinning, and such strangers as had come over to the island in the morning were waiting for the cool of the evening to return. She had little time to look about, for, before she could remonstrate, Antonio had taken her in his arms, and carried her through the shallow water to the boat, as though she had been a child. Then he leaped in after her, and with a stroke or two of his oars they were in the open bay.

She seated herself in the bow of the boat, and turned partially from him so that he could see only her profile. Her face wore a more determined look than usual—the lips were firmly closed, and around her delicate nostrils there played a defiant expression, that harmonized admirably with the almost wild gleam of her eyes. After they had gone

on for some time in silence, feeling the sun uncomfortably warm, she undid her bundle, threw the handkerchief over her head, and began to make her dinner of the bread she had brought from home, for at Capri she had eaten nothing.

This was soon too much for Antonio. He brought out a couple of the oranges with which his baskets had been filled in the morning, and said:

"Here, eat these with your bread, Laurella; you needn't think I saved them for you. They fell out of the baskets, and I found them when I returned to the boat."

"Eat them yourself; dry bread will do very well for me."

"They will refresh you after your long walk in the hot sun."

"I drank a glass of water just before I came down to the shore—that refreshed me enough."

"As you please," said he; and he threw the oranges into one of the baskets.

Again they were silent. The bay was as smooth as a mirror, not even a ripple was heard under the prow; even the white sea-birds, that nest among the rocks along the shore, flew noiselessly to and fro in search of prey.

"You might take the oranges home to your mother," recommenced Antonio.

"We have plenty, and when they are gone I can buy more."

"Take them to her with my compliments."

"She does not know you."

"But you can tell her who I am."

"I do not know you either."

This was not the first time she had disclaimed acquaintance with him. About a year previously, just after the Neapolitan painter came to Sorrento, Antonio chanced one Sunday to be playing *boccia* with some friends, in a little square near the principal street. During the game Laurella passed, as did the Neapolitan, who, struck by her beauty, stopped to gaze after her, unmindful that he was standing in the way of the players. Suddenly there came a swift ball against his ankles, as a reminder that he should choose some other spot for his reveries. He looked round as though he expected an apology; but the stalwart young boatman, who had thrown the ball, fixed his eyes upon him with such a defiant mien, that the stranger deemed it prudent to go his way and avoid an altercation. Still the incident was made the subject of remark, especially at the time the painter pressed his suit to Laurella. "I do not know him," said she, indignantly to the painter, when he asked her if she refused him on account of the disreputable boatman. And yet the gossip to which the incident gave rise had reached her ears, and she had known Antonio well enough when she had met him.

And now they sat together in the boat like the bitterest of enemies, while both their hearts beat furiously. Antonio's usually good-natured face was scarlet; he rowed so wildly as to throw the water into the boat, and every now and then his lips moved as though he was muttering angry words. Laurella pretended not to notice him, and, putting on her most unconscious look, she leaned over the side of the boat and let the water ripple between her fingers. Then she took the handkerchief off her head and arranged her hair, as though she had been alone. She could not control her eyebrows, however, and it was in vain that she tried to cool her burning cheeks with her wet hands.

They were now well out in the open sea. The island was far behind them, and the coast ahead of them lay equally distant in the hot haze. Not a sail was to be seen near or far; not even a passing gull was there to break the monotony of the scene. A thought seemed to strike Antonio, and he suddenly looked anxiously around. His face became pale, and he let go of his oars. Laurella looked toward him involuntarily—fearless, yet attentive.

"I must put an end to this," he began, breaking silence at last; "it has already lasted too long. I wonder it has not killed me before now. You do not know me, you say? Not know me! And how long is it now that you have seen me pass you like a madman, my heart full of what I had to say to you? If you do not know me, why do you always turn your back and frown when we meet?"

"What have I had to say to you?" she asked. "True, I have seen that you put yourself in my way; but I don't mean to give people any thing to gossip about, if I can help it. I do not want you for a husband—no, neither you nor any one else!"

"Nor any one else? You will not always say so. You say so

now because you refused that painter. Bah! you were only a child then. The time will come when you will feel lonesome enough; then you will be glad to accept the first one who comes."

"No one knows what changes even a day may make. It may be that I shall change my mind. Who knows? But whether I do or do not, what is it to you?"

"What is it to me?" he cried, and sprang to his feet so violently that he came near capsizing the boat. "What is it to me, you ask, when you know very well how I feel toward you?"

"Have I ever promised myself to you? Am I to blame for your folly? What right have you to me?"

"Oh, my right is not written down anywhere, I grant you," he cried; "but, for all that, I know that I have the same right to you that I shall have to heaven, if I live an honest Christian life. Do you think I will see you go to the altar with another, and then afterward see myself the sport of all the girls and fellows in Sorrento?"

"You can do what you please, but you need not think I can be frightened by your threats."

"You will not say so long," said he, and his whole frame trembled with excitement. "I am no milksop to allow my whole life to be wrecked by a stubborn girl like you. Do you know that I have you now in my power?"

She started slightly at the thought, but, quickly recovering her self-possession, she fixed her eyes on him defiantly.

"Very well, you can kill me if you will," said she, calmly.

"I do nothing by halves," said he, in a low, intense tone. "There is room for us both in the sea. I must, I must, my child!" He spoke in a dreamy, compassionate tone. "We must both go down together, both at once, and now too!" he cried, frantically, and seized her in his arms; but he instantly drew back his right hand. It bled profusely from a wound inflicted by her teeth.

"Ha, am I in your power? You can do with me as you please, can you?" she cried, and, pushing him energetically away, she plunged into the water and disappeared beneath the surface. She rose, however, almost immediately. Her skirts clung close to her symmetric figure, and her long hair, loosened by the water, hung heavily about her shoulders. As she came up, without uttering a word, she began to swim steadily toward the shore. Fright seemed for a moment to have robbed him of his senses. He stood up in the boat and gazed at the swimming girl like one petrified with astonishment; then, recovering self-command, he seized his oars, and, in spite of his wound, which bled profusely, he rowed vigorously after her. In a moment, rapidly as she swam, he was at her side.

"For Heaven's sake," he cried, "get into the boat!—I was mad—God only knows what came over me—I knew not what I did! I do not even ask you to forgive me: I ask only that you get into the boat, and do not expose your life!"

She swam on as though she did not hear him.

"You can never swim to the shore; it is full two miles. Think of your mother! If you should be drowned, she would die of grief."

She measured the distance from the coast with her eye, and then, without making any reply, she swam up to the boat and caught hold of its side. As he rose to aid her, the list her weight gave to the boat, caused his jacket, which was lying on one of the thwarts, to slide into the water. Before he could render her any assistance, she was in her former place. Seeing that she was safe, he quickly took to his oars again, while she began to wring out her dripping clothes and hair. As her eyes fell on the bottom of the boat, and saw it covered with blood, she glanced quickly at his hand, which held the oar as though it had been unhurt. "Here, take this," said she, holding out her handkerchief. He shook his head, and went on rowing. She hesitated a moment, then rose and bound the handkerchief carefully around the wounded hand. This done, she took one of the oars, and, in spite of his endeavors to prevent her, she seated herself on the thwart behind him, and began to row with steady and vigorous strokes.

They were both pale and silent.

As they approached the shore, they met numerous fishermen coming out to set their nets for the night. They shouted to Antonio, and bantered Laurella, but neither of them made any reply, or ceased for a moment to ply their oars.

The sun still stood high over Procida when they reached the mouth of the creek. Laurella shook out her skirts—now nearly dry—and

sprang to the shore. The old woman who saw them start in the morning was still spinning on her terrace.

"What's the matter with your hand, Tonino?" she cried out. "Santa Maria! the boat is full of blood!"

"It is nothing, Comare," answered Antonio. "I scratched my hand on a nail—that's all. It will be well in a day or two. It bled freely, and that makes it look worse than it really is."

"I will come and dress it with some of my herbs, Comparello—yes, yes; I must dress it for you!"

"No; it's not worth while, Comare—I thank you. The bandage that's on it now will do very well. It will soon be well—my flesh heals so quickly. I often get these scratches, you know."

"Addio!" said Laurella, and took the path that winds up the cliffs.

"Buona sera!" replied Antonio, without looking up. Then, gathering up his oars and baskets, he slowly ascended the stone steps that led to his hut.

He was alone in the two rooms, and began to walk to and fro in a very uneasy frame of mind. The breeze, as it passed through the open windows, which could be closed only with wooden blinds, was somewhat more refreshing than in the sun on the open sea. He stood long before a little picture of the Virgin, and gazed thoughtfully at the halo around her head, made of stars cut out of silver paper; but he felt no inclination to pray. Now that he had lost, irretrievably lost, what he had so ardently hoped for, what was there left worth the asking?

And the day, it seemed, would never end. He so longed for night to come! He was fatigued, and more exhausted from the loss of blood than he was willing to acknowledge even to himself. His hand pained him severely; so he sat down and loosened the handkerchief. It was badly swollen, and, as soon as the bandage was removed, it began again to bleed. Having, to cool it, immersed it for some time in water, and carefully washed it, he distinctly saw the marks of Laurella's teeth.

"She was right," he muttered; "I was a brute, and deserved no better. To-morrow I will send Giuseppe with her handkerchief; me she shall never see again!"

After he had carefully washed the blood out of the handkerchief, and hung it in the sun to dry, he bound up his hand as well as he could, and threw himself on his bed.

He was not long in falling into a doze; but the bright moonlight, and the pain of his wound, soon awakened him. He had just risen to immerse his hand again in water, when there came a rap at his door.

"Who's there?" he asked, and went to receive his visitor. He opened the door, and Laurella stood before him.

She came in without saying a word, and, almost without looking up, took off the handkerchief she wore over her head, and set a little basket she carried on the table. There was a certain nervousness in her movements, that betrayed an inward struggle in spite of her endeavors to appear composed.

"You have come for your handkerchief?" began Antonio; "if you had waited till to-morrow morning, I would have saved you the trouble by sending Giuseppe with it."

"No, it is not for my handkerchief that I came," she answered, quickly. "I have been up among the hills for herbs to stop the blood. See!" and she raised the cover of her basket.

"It was not worth while to take so much trouble," he said, in a kindly tone. "My hand is already much better; but, if it were worse, it would be no more than I deserve. Why do you come to me at such an hour? If any one should see you!—you know how ready people are to talk."

"Let them talk—what do I care?" said she, impatiently. "But show me your hand, and let me dress the wound with these herbs."

"I tell you it is quite unnecessary."

"Well, let me see it, that I may judge for myself." Despite his remonstrances, she took his hand and removed the old linen bandage he had awkwardly wound around it. "Good Heavens! is it possible?" she cried, with a shudder, when she saw the condition it was in.

"It is swollen some, I know," said he, calmly; "but the swelling will go down in a day or two."

She shook her head incredulously.

"You will not be able to do any thing for a week, at least."

"A week—well, no matter!"

She brought a basin of water, and washed his hand carefully—an operation to which he passively submitted. This done, she covered it with fresh leaves from her basket, and then bound it up with some strips of linen she had also brought with her.

"Thank you," said he, when she had finished. "And now, if you would do me one more favor, not only forgive me for acting so like a madman to-day, but forget all I did and said. What possessed me is more than I can tell. You certainly have never given me cause to act so like a maniac. I will never say any thing to you again that will displease you, I promise you—much less do any thing to displease you."

"It is I who should beg pardon of you," said she; "I should have answered you very differently, and not have angered you with my disagreeable ways. And then to have bitten you so!"

"You did it in self-defence. It was high time to bring me to my senses. Besides, the wound is not serious. Let us say no more about it. You have taught me a wholesome lesson, and I thank you for it. And now I won't keep you any longer. There—there is your handkerchief; you can take it with you."

He handed it to her. Still, she did not go.

"I—I have been the cause of your losing your jacket," said she, after a pause. "I know that all the money for the oranges was in it. I did not think of that at the time. I cannot replace the money now—we have not so much at home, and, if we had, it would be mother's; but I have this silver cross, that the painter left on the table when he came to see us the last time. I have hardly looked at it since then, and do not care to keep it any longer in my box. If you were to sell it—it must be worth a few piastres—you would have part of the money back; the rest I could earn by spinning at night, when mother is asleep."

"If your cross is not sold till I sell it, then it will never be sold," said he.

"You must take it," she replied, laying it on the table. "Who knows how long you will be laid up with your hand? There it lies, and I don't want to ever see it again."

"If you leave it, I'll throw it into the sea."

"I do not offer you a present; I only give you a part of what is your due."

"My due? You owe me nothing; I have no claims on you whatever; and in future, when we meet, do me the favor not to look my way. You would only remind me of what has passed between us to-day, and I would forget it. And now, good-night—yes, and—for the last time!"

He put the handkerchief in her basket, and the cross with it. As he looked up, he was greatly alarmed. Big tears chased one another down her cheeks, and she made no effort to restrain them.

"Maria Santissima! are you ill?" he cried. "You tremble from head to foot!"

"It is nothing; I will go home," she replied, and turned toward the door; but, unable to control herself longer, she leaned her head against the wall, and sobbed bitterly. Then, suddenly, before he in his amazement could decide what to do or say, she turned, and threw herself into his arms.

"Oh, I cannot endure it!" she cried. "I cannot bear to go from you in this way, with all this load upon my conscience! If it is true that you love me so much, that you can love me still, after what I have done, then do not drive me from you, but take me and do with me as you will."

He held her for some moments in his arms, speechless with ecstasy.

"Love you still!" he cried, finally. "Do you think the last drop of my heart's blood has run out through this little wound? No, no! my heart throbs at this moment as it never throbbed before! But, if you say you will be mine only to try me, or because you pity me, then go, and I will forget this too. No, I would not allow you to sacrifice yourself, no matter how much I suffered."

"Sacrifice myself!" she cried, looking up from his shoulder into his face with her tearful eyes. "It is no sacrifice, for—for I love you, Tonino!"

"Love me!" exclaimed Antonio, wild with joy.

"And," she continued, "if I have always been so disagreeable, it was because I feared I should love you, and fought against it. But now I will be very different. As for passing you in the street without

looking at you, I never could have done that; and, lest you may fear, when I am gone, that this is all a dream, you shall be able to say to yourself, 'She kissed me,' and Laurella kisses no man she would not have for her husband."

A moment later Laurella was on her way home, and Antonio stood alone, bewildered but joyous, in his little hut.

CONCERNING CATS.

THE following quaint description of the cat is to be found in John Bossewell's "Works of Armorie," published in 1597: "The field is of the Sapphire, on a chief Pearle, a Masion Cruives. This beaste is called a 'Masion,' for that he is enimie to Myse and Rattes. He is slye and wittie, and seeth so sharply that he overcommeth darkness of the nighte by the shynings lyghte of his eyne. In shape of body he is like unto a Leopard, and hathe a greate mouthe. He doth delighte that he enjoyeth his libertie; and in his youth he is swifte, plyante, and merye. He maketh a rufull noyse and a gastefulle, when he profereth to fighte with another. He is a cruell beaste when he is wilde, and falleth on his owne feete from moste highe places; and never is hurt therewith. When he hathe a fayre skinne he is, as it were, proude thereof, and then he goethe muche aboute to be seene."

These are some of the best-known proverbs concerning cats:

"Care will kill a cat."

"A muffled cat is no good mouser."

"That cat is out of kind that sweet milk will not lap."

"Fain would the cat fish eat, but she is loath to wet her feet."

"When the cat winketh, little wots the mouse what the cat thinketh."

"Though the cat winks a while, yet sure she is not blind."

"That that comes of a cat will catch mice."

"A cat may look at a king."

"An old cat laps as much as a young kitten."

"When the cat's away the mice will play."

"When the candle is out all cats are gray."

"I'll keep no more cats than will catch mice."

"Who shall hang the bell about the cat's neck?"

"A cat has nine lives, and a woman has nine cat's lives."

"Cats eat what hussies spare."

"Cats hide their claws."

"The wandering cat gets many a rap."

"The cat is hungry when a crust contents her."

"He lives under the sign of the *cat's-foot*," that is to say, he is henpecked—his wife scratches him.

Shakespeare says:

"Letting 'I dare not' wait upon 'I would,'
Like the poor cat i' the adage."

And—

"Let Hercules himself do what he may,
The cat will mew and dog will have his day."

It is taught us that if a cat be carried in a bag from its old home to a new one, let the distance be what it may, it will surely return again; to prevent which, it must be carried backward into the new house.

A cat's eyes wax and wane as the moon waxes and wanes, and the course of the sun is followed by the apples of its eyes.

The brain of a cat is useful as a love-spell, if taken in small doses.

If a man swallow two or three cat's hairs, they will cause him to faint.

As a cure for epilepsy, take three drops of blood from under a cat's tail in water.

The horse ridden by a man who has got any cat's hair on his clothing, will perspire violently and soon become exhausted.

If the wind blows over a cat riding in a vehicle, upon the horse drawing it, it will weary the horse very much.

To preserve your eyesight, burn the head of a black cat to ashes, and have a little of the dust blown into your eyes three times a day.

To cure a whitlow hold the finger affected in a cat's ear for a quarter of an hour every day.

The fat of the wild-cat is good for the curing of epilepsy and

lameness. The skin of the wild-cat worn as coverings will give strength to the limbs.

If one dreams that he hath encountered a cat or killed one, he will commit a thief to prison and prosecute him to the death, for the cat signifies a common thief. If he dreams that he eats cat's flesh, he will have all the thief's goods.

If any one dreams he fights with a cat that scratches him sorely, that denotes some sickness or affliction. If any shall dream that a woman become the mother of a cat instead of a well-shaped baby, it is a bad hieroglyphic, and betokeneth no good to the dreamer.

Among various receipts in occult philosophy published in the *Conjuror's Magazine*, in 1791, are the following directions "how to draw cats together and fascinate them."

"In the new moon gather the herb nepe and dry it in the heat of the sun, when it is temperately hot; gather vervain in the hour ♀, and only expose it in the air while ☉ is under the earth. Hang these together in a net, in a convenient place, and when one of them has scented it, her cry will soon call those about her that are within hearing, and they will rant and run about, leaping and capering to get at the net, which must be hung or placed so that they cannot easily accomplish it, for they will certainly tear it to pieces. Near Bristol there is a field that goes by the appellation of the 'Field of Cats,' from a large number of these animals being drawn together there by this contrivance."

Pussy's connection with the occult sciences has been such as to bring her into very bad repute with those who know the extent of her evil doing in this respect. We have the authority of an old pamphlet entitled "Mewes from Scotland," etc., printed in the year 1591, for the confessions of a witch, who "took a cat and christened it," etc., and that, in the night following, the said cat was conveyed into the "middest of the sea by all these witches sayling in their riddles or cives, so left the said cat right before the towne of Leith, in Scotland. This done there did arise such a tempest at sea, as a greater bath not been seen since."

"Again, it is confessed, that the said christened cat was the cause of the King's Majesties shippe, at his coming forthe of Denmark, had a contrarie wind to the rest of the shippes then being in his companie, which thing was moste straunge and true, as the King's Majestie acknowledgeth, for when the rest of the shippes had a fair and good winde, contrarie and altogether against his Majestie," etc.

In 1618, Margaret and Philip Flower were executed at Lincoln for witchcraft. Their chief crime, it was asserted, was the procuring the death of Lord Henry Mosse, eldest son of the Earl of Rutland, by procuring his right-hand glove, which after being rubbed on the back of their imp Rutterkin, who lived with them in the form of a cat, was plunged into boiling water, pricked with a knife, and buried in a dunghill, so that, as that rotted, the liver of the young man might rot also, which was affirmed to have come to pass.

Lady Duff Gordon, in an article in *Macmillan's Magazine*, gives us a glimpse of a strange superstition in Thebes. She says:

"Do you remember the German story of the lad who travelled 'um das gruseln zu lernen' (to learn how to tremble)? Well, I, who never 'gruselte' (quaked) before, had a touch of it a few mornings ago. I was sitting here quietly drinking tea, and four or five men were present, when a cat came to the door. I called 'Bis, bis!' and offered milk; but puss, after looking at us, ran away.

"'Well dost thou, lady,' said a quiet, sensible man, a merchant here, 'to be kind to the cat, for I dare say he gets little enough at home; his father, poor man, cannot cook for his children every day;' and then, in an explanatory tone to the company: 'That's Alee Nassee's boy, Yussef; it must be Yussef, because his fellow-twin, Ismaeen, is with his uncle at Negadeh.'

"'Nur gruselte' (I shuddered), I confess; not but what I have heard things almost as absurd from gentlemen and ladies in Europe, but an 'extravagance' in a caftan has quite a different effect from one in a tail-coat.

"'What! my butcher-boy who brings the meat—a cat!' I gasped.

"To be sure, and he knows well where to look for a bit of good cookery, as you see. All twins go out as cats at night, if they go to sleep hungry; and their own bodies lie at home like dead, meanwhile; but no one must touch them, or they would die. When they grow up to ten or twelve they leave it off. Why, your own boy, Achmet, does it.—Ho, Achmet!"

"Achmet appears.

"'Boy, don't you go out as a cat at night?'

"'No,' said Achmet, tranquilly, 'I am not a twin. My sister's sons do.'

"I inquired if people were not afraid of such cats.

"'No, there is no fear; they only eat a little of the cookery, but, if you beat them, they tell their parents the next day: "So-and-so beat me in his house last night," and show their bruises. No, they are not afreets; they are *beni-Adam*. Only twins do it, and if you give them a sort of onion-broth and some milk the first thing when they are born, they do not do it at all.'

"Omar professed never to have heard it, but I am sure he had, only he dreads being laughed at.

"One of the American missionaries told me something like it, as belonging to the Copts; but it is entirely Egyptian, and common to both religions. I asked several Copts, who assured me it was true, and told it just the same. This notion fully accounts for the horror the people feel at the idea of killing a cat."

A common superstition charges cats with sucking the breath of infants, thereby causing their death by strangulation. This is a false accusation, as pussy's mouth is so formed anatomically that she would not be able to do so sanguinary a deed did she wish it. Instances are on record where cats have crawled into a cradle or a bed, and lain down on an infant's face, not probably with any criminal intent—though children have been found dead under such circumstances—but purely for the sake of the warmth of the infant's body and clothing.

Everybody has heard of the Kilkenny cats who fought in a saw-pit until only a tail of either combatant was left. This is said to be an allegory designed to typify the ruin which centuries of litigation and embroilments on the subject of conflicting rights and liberties brought to the respective exchequers of Kilkenny and Irishtown, separate corporations existing within the limits of one city, and the boundaries of whose respective jurisdictions had never been definitely marked out by an authority which either was willing to recognize. These struggles were commenced A. D. 1377, and fought, as only vestrymen *can* fight, for over three hundred years, at the end of which time, as might be supposed, very little was left, financially speaking, of either party.

There is, however, another story of a great cat-fight in the same neighborhood. One summer night, all the cats in the city and county of Kilkenny were absent from their homes, and the next morning a plain near the city was strewn with thousands of slain cats; and it was supposed that almost all the cats in Ireland joined in the fight, as was shown by collars on the necks of some of the dead, bearing the names of places in all quarters of Ireland. The cause of the quarrel is not known, but there are men alive who knew persons, since dead, who actually inspected the field.

It was once upon a time a trick of a countryman to bring a cat to market in a bag, and substitute it for a sucking pig in another bag, which he sold to the unwary when he got a chance. If the trick was prematurely discovered, it was called *letting the cat out of the bag*; if otherwise, he who made the bad bargain was said to have *bought a pig in a poke*.

Cats usually fall on their feet, because of the ease with which they balance themselves in leaping from a height, which power of balancing is, in some degree, produced by the flexibility of the heel, the bones of which have no fewer than four joints. A cat, when falling with its head downward, curls its body so that the back forms an arch, while the legs remain extended. This so changes the position of the centre of gravity, that the body makes a half-turn in the air, and the feet become lowest.

The French of cat is *chat*; the German, *katze*; the Italian, *gatto*; the Spanish, *gato*; the Dutch and Danish, *kat*; the Welsh, *cath*; the Latin, *catus*; the French of puss is *minette*. The only language in which the name of the cat is significant, is the Zend, where the word *gatu*, almost identical with the Spanish *gato*, means a place—a word peculiarly significant in reference to this animal, whose attachment is peculiar to place, and not to the person, so strikingly indicated by the dog. It is possible that "puss" is derived from the Egyptian name *pashu*; but the derivation is generally agreed to be from the Latin *purus* (a little boy) or *pusa* (a little girl).

In Abyssinia, cats are so valuable that a marriageable girl, who is likely to come in for a cat, is looked upon as quite an heiress.

Apollo created the lion to terrify his sister Diana, and she turned

his fearful beast into ridicule by mimicking it in the form of a cat. Cats were dedicated to Diana, not only when she bore her proper name, but when she was called "Hecate." Witches who worshipped Hecate had always a favorite cat.

There is a cape on the Isle of Cyprus which was once called Cat Cape. A monastery stood there, the monks of which were bound by a vow to keep a great number of cats, to destroy the snakes with which the island abounded. At the sound of a certain bell, the cats came trooping home to their meals, and then rushed out again to the chase. When the Turks conquered the island, both the cats and their home were destroyed, or this wonderful sight might doubtless be still seen.

In the middle ages, cats performed an important part in some religious festivals. At Aix, in Provence, on the festival of Corpus Christi, the finest tomcat in the country, wrapped in swaddling-clothes, like a child, was exhibited in a magnificent shrine to public admiration. Pussy was worshipped with bended knees, strown flowers, and the pouring of incense; but, on the festival of St. John, the poor animal's fate was reversed. A number of cats were placed in a wicker-basket and thrown alive into the midst of an immense fire kindled in the public square. Bishop and clergy officiated on the occasion, hymns and anthems were sung, and processions made by priests and people, in honor of the sacrifice.

Cats have been known to successfully act the part of a police detective. A woman was murdered at Lyons, and when the body was found, as it lay weltering in blood, a large white cat was noticed mounted on the cornice of a cupboard. He sat motionless, his eyes fixed upon the corpse, and his looks expressing horror and affright. Next morning, he was still seen there, and when the room was filled with the officers of justice, and a noisy crowd of lookers-on, he still remained unmoved. As soon, however, as the suspected persons were brought in, his eyes glared with fury, and his hair bristled. He darted into the middle of the room, stopped a moment to gaze upon them, and then fled. The faces of the assassins, for the first time, showed signs of guilt, and, on being brought to trial, they confessed their crime, and were executed.

A State-prison convict once stated that, on a certain occasion, he and two others broke into the house of a gentleman near Harlem. While they were in the act of plundering it, a large black cat flew at one of the robbers, and fixed his claws in both sides of his face. He added that he never saw a man so frightened in his life; and that, in his alarm, he made such an outcry that they had to beat a precipitate retreat to avoid detection.

In September, 1850, the mistress of a public-house, in the Commercial Road, London, going late at night into the tap-room, found her cat in a state of excitement, running wildly to and fro between its mistress and the chimney-piece, and mewing loudly. The landlady becoming alarmed, called for help, and on investigation a robber was discovered hidden in the chimney.

A man in the south of Ireland once severely chastised a cat for some misdemeanor, after which the cat disappeared. A few days after, the man, being from home, met the cat in a narrow path, and, the animal looking at him with a wicked aspect, he endeavored to frighten her away, when she sprang at him, and fastened herself to his hand with so ferocious a grip that it was impossible to make her open her jaws, and the creature's head was actually severed from the body before the hand could be extricated. The man afterward died from his injuries.

FLOWER-FARMS.

THE flower-farms of the modern world are for the most part situated in Europe. In fact, although many of the finest perfumes known to commerce are grown in the East Indies, Ceylon, Mexico, and Peru, the South of Europe is considered the only garden that can be relied on by the modern perfumer.

France and Italy claim about equal prominence as seats of the art. In the former, Grasse and its vicinity are the principal places of flower growth and decoction; in the latter, Nice monopolizes the very flower of the Italian flower-growing reputation. Both these cities command within a short radius those peculiar qualities of climate best suited

to the varied growths of flowers. As, for instance, on their mutual sea-coast, their carlie (that all in all, almost, to a perfumer) grows without possible danger of frost, a single night of which would destroy all the blossoms of a season; while nearer the Alps—which bloom all the sweeter for a touch of Winter's icy breath, or a suggestion of it, to say the least—the most marvellous and sweetest violets are produced which can be found in all Europe.

But, speaking of violets, sweet even as are the violets of Nice, those of England, together with the lavender and peppermint, are the violets of commerce. The specialty of Sardinia, however, in default of the British, is for the cultivation of *violet* and *rézèda*.

Sicily prides herself especially upon her lemon, bergamot, and orange.

Cannes, in France, delights in the exportation of blossoms and all the products resulting from the fragrant varieties of rose, tuberose, cassia, jasmine, and orange-neroli. At Nismes, the cultivators direct their chief attention to thyme, rosemary, aspic, and lavender.

Mitcham, in Surrey, and Hitchin, in Hertfordshire, in England, realize eight times the price in the market for peppermint and lavender of those produced in France or elsewhere, and are fully worth the difference for delicacy of odor.

Adrianople (Turkey in Europe), Broussa and Uslak (Turkey in Asia), and Guzepore (India), also supply other varieties of perfumes to the world's-market.

British India and Europe, according to Peisse, annually consume, at the very lowest estimate, one hundred and fifty thousand gallons of perfumed spirits under various titles—such as Hungary water, essence of lavender, *esprit de rose*, etc. Scents for the use of the *mouchoir* are not alone included in the distribution of these figures. In it are included perfumes also for inodorous matters, such as the various soaps, starch, oils, and grease, which are consumed at the toilet of fashion. Some account of the immense quantities of the various odors distilled from a single manufactory in a single year may well bear repetition:

At the establishment of M. Herman, at Cannes, annually are used: 140,000 lbs. of orange-flowers; 12,000 lbs. of cassia-flowers; 140,000 lbs. of rose-leaves; 32,000 lbs. of jasmine-blossoms; 20,000 lbs. of violets; 8,000 lbs. of tuberose; 16,000 lbs. of rosemary, mint, lemon, citron, thyme, and other odorous plants in larger proportion.

It is an interesting fact, not generally known, that white or slightly-tinted flowers are by far the most odorous, and most sweetly so. A table of their comparative color value is thus given:

COLORS.	SPECIES.	ODOR-IFEROUS.	COLORS.	ODORS.	
				Agreeable.	Dis'gr'ble.
White.....	1,193	187	White.....	175	12
Yellow.....	951	75	Yellow.....	61	14
Red.....	923	85	Red.....	76	9
Blue.....	594	31	Blue.....	23	7
Iris.....	307	23	Iris.....	17	6
Green (?).....	153	17	Green (?).....	10	2
Orange.....	50	10	Orange.....	9	2
Brown.....	18	1	Brown.....	1	1

By the above it will be seen that the lightest-colored flowers are the only ones, comparatively, of any use to the perfumer.

Blossoms born of a torrid zone, and in the hottest climates, are more prolific in number, as a usual thing, but of much less fragrance. Flowers rooted in temperate climates, on the other hand, are usually, in comparison, of a peculiarly sweet and delicate bouquet.

On flower-farms the different species of blossoms grow about proportionally:

"Thirty thousand jasmine-plants will occupy an area of land equivalent to fifteen hundred metres, and will produce during the entire season one thousand kilogrammes of flowers.

"Five thousand rose-tree plants will occupy eighteen hundred metres of land, and will produce ten kilogrammes of rose-flowers during the season.

"One hundred orange-trees, at the age of ten years, will occupy four thousand metres of land, and will produce during the season one thousand kilogrammes of orange-flowers.

"Eight hundred geranium-plants will occupy two hundred metres

of land, the produce of which during the season will be one thousand kilogrammes of geranium-flowers.

"Violets—five thousand metres of land, one thousand kilogrammes of violet-flowers.

"Tuberose—seventy thousand tuberose-roots, one thousand kilogrammes of flowers; and for their culture will require one thousand metres of land."

The yearly produce of violets at Nice and Cannes alone (Grasse does not grow the violet) amounts to twenty-five thousand kilogrammes, the annual remanufacture of which into oils and pomades is twelve thousand kilogrammes. If, however, the produce furnished by the different manufacturers were genuine, it would not be possible to produce more than six thousand kilogrammes of the essence in its pure state from the quantity of flowers just mentioned.

The orange-flowers of Nice, besides its violets, amount to two hundred thousand kilogrammes; those of Cannes and the villages in its vicinity, about four hundred and twenty-five thousand kilogrammes. These latter are considered very nearly the finest known to the commerce of perfume, being infinitely superior to those of Nice, which latter are used only for distillation.

One thousand kilogrammes of orange-flowers produce eight hundred grammes of pure neroli. Six hundred kilogrammes of orange-flower gums produce one kilogramme of pure *petit grain*.

To the uninitiated, the separate technical terms of neroli and *petit grain*, both applied to the distillation of orange-flowers, may seem somewhat confusing.

It must be borne in mind that some plants, or different parts of the same plants, yield more than one distinct odor. The orange, for example, gives three distinct perfumes: from the leaves we have the *petit grain*; from the flowers, neroli; and from the rind of the fruit is distilled the essential oil of orange, which has been christened "Portugal."

In consideration of these three perfectly distinct and yet most exquisite odors the orange is rightly recognized as perhaps the most invaluable auxiliary to the perfumer.

IF AT LAST.

[An Arab, journeying across a vast desert, wearily exclaimed: "I pray that before I die this my desire may be fulfilled—that at a river, dashing its waves against my knees, I may fill my leathern sack with water!"—SAADI.]

I.

WITH silent lip and unappealing eye,
And forehead bared to the unkindly sky,
I'll walk life's way, and find its burdens sweet,
Its burning sands like moss beneath my feet;

II.

And from my heart no sob of grief shall rise,
E'en when the fair mirage before me flies,
And I awake from weak, fond dreams, wherein
I have beheld, dear love, what might have been;

III.

Stout-hearted, I will spring to meet each day
Of dust and toil that bears me on the way,
And pain and thirst shall be unfelt, unknown—
If I may call thee, at the last, my own!

IV.

If, after patient years, I may but come
To dwell with thee in some sweet sylvan home,
And, underneath life's soft autumnal sky,
To live one little day before I die!

SCENERY OF NEVADA.

PYRAMID LAKE, NEVADA.

NEVADA, in common with the entire region lying between the Sierra Nevada and the Rocky Mountains, is an elevated plain having a general altitude of about four thousand feet above the sea. Crossing this plateau are many mountain-ranges, whose peaks vary in height from five to twelve thousand feet. The sides of these mountains are everywhere cut by deep ravines, or canyons, most of them running from crest to base, and usually at nearly right angles with the general course of the ranges. The canyons vary greatly in width, and

some of them have streams flowing through them, while others are entirely destitute of water. Granite, sienite, slate, limestone, and porphyry, are the prevailing rocks. The tops of the divides, between the lateral canyons, are especially apt to be sharp and ragged, the bare and splintered rocks occasionally standing far above the crest of the ridge, and sometimes strongly inclined toward the comb of the principal mountain.

Most of the ranges are covered with a scanty growth of bunch-

grass, and with patches of *piñon*, juniper, and other scrubby trees; but much of their surface is destitute of grass or any other useful species of vegetation, and three-fourths of it is wholly without timber. Along some of the streams flowing through the canyons are narrow strips of arable land, which frequently, at the point where the canyons open into the valley, spread out into tracts of several acres, affording a sufficiency of tillable land for gardens and small farms.

There are fewer rivers in Nevada than in any of the large States of the Union, but nearly all the surface-water of the country is col-

lected in lakes, none of them of large size, and most of them extremely shallow. The largest that lie wholly within the State are Pyramid Lake, formed by the waters of Truckee River, and Humboldt, Walker, Carson, and Franklin Lakes, formed respectively by the waters of the rivers bearing those names.

Pyramid Lake, which is the largest, derives its name from a pyramidal rock near its centre, rising six hundred feet above the surface of the water. This lake abounds in trout of large size and fine flavor, is of considerable depth, and is entirely surrounded by precipitous

COLUMN MOUNTAINS, NEVADA.

mountains two or three thousand feet high. The scenery is exceedingly grand. Nevada, in fact, is one of the most picturesque and interesting countries in the world, and is almost without a rival for the grandeur and sublimity of its mountain-views, of which the illustrations in this number of the JOURNAL give only a partial indication. To represent adequately the scenery of this vast State, which is considerably more than twice as large as New York, will task for ages to come the pencils of American artists.

Mr. Bowles, in his animated narrative of his ride "Across the Continent" in 1865, speaks thus of the scenery of Nevada: "Mountains are always beautiful, and here they are ever in sight, wearing every variety of shape, and even in their hard and bare surfaces presenting many a fascination of form—running up into sharp peaks; rising up and rounding out into innumerable fat mammillas, exquisitely shaped; sloping down into faint foot-hills, and mingling with the plain to which they are all destined; and now and then offering the silvery streak of snow, which is the sign of water for man and the promise of grass for ox. Add to the mountains the clear, pure, rare atmosphere, bringing remote objects close, giving new size and distinctness to moon and stars, offering sunsets and sunrises of indescribable richness and reach of color, and accompanied with cloudless skies and a south wind, refreshing at all times, and cool and exhilarating ever in the afternoon and evening—and you have large compensations even for the lack of vegetation and color in the landscape."

Of Wright's Canyon, the scene of one of our illustrations, Mr. W. W. Bailey, to whom we are indebted for the sketch from which our engraving was made, gives us the following account:

"In the autumn of 1867, after a very arduous geological campaign upon the Truckee and Humboldt Rivers, the party, of which I was a member, encamped in the mountains, in order to escape the noxious miasms of the valleys, from which we had all, more or less, suffered. The larger portion of our force, with its accompanying military escort, pitched its tents at the opening of Wright's Canyon, some six miles from Oreana, on the Humboldt. We noticed here a phenomenon which at first alarmed us greatly. The stream, which supplied us with water, became perfectly dry at noon, and we began to fear that our supply was exhausted. At night, however, to our great surprise, it began to flow again, suddenly, and with much noise. The same thing was repeated every day. This is the result, probably, of the tremendous diurnal evaporation, which exhausts the water before it can reach the plain. The equally powerful radiation which takes place during the night, and possibly a direct condensation from the atmosphere, are sufficient causes for the restoration of the stream to its normal condition, if fluidity can be correctly considered the natural state of any thing in the arid regions of the Great Basin.

"The more invalid portion of our party were wisely ordered to encamp a mile or so farther up the canyon, and a rough mountain road or trail led to their airy retreat. The horses, too, which had fared but poorly on the sage-brush and grease-wood of the barren deserts, were removed to the same place, and by means of the scanty but rich supply of bunch-grass were able to prolong their wretched existence. It is marvellous how these animals can sustain life in a country where there is apparently so little forage; but they do live and thrive.

"One day my friend the photographer and myself determined to visit the invalids, and to explore the wonders of the hills. We found our unfortunate comrades encamped in a most romantic spot, around which rose the towering summits of the mountains. A series of bold and castellated ridges of granite attracted our attention, and we resolved to scale them. The worst part of our climb, the whole of which was arduous, was up a steep sage-brush hill, which led to the base of the attractive rocks. We found the granite wall very fantastic in outline, steep, and hollowed into a variety of curious caves. The weather, and perhaps the wind-borne sand, which is a powerful agent in this country, had acted upon it in a most peculiar manner. The surface of the cliffs in some places looked as if the granite had once been liquid, and a breeze gently blowing over it had rippled the plastic material, which had then been suddenly petrified. The actual cause of the appearance is, however, quite different. It is doubtless owing to certain portions of the rock having a more durable composition than the rest, which is consequently eroded, leaving the harder parts standing in relief. Quite large junipers grew among these rocks, and offered a refreshing shade. The wind blew furiously on the top, and, coming to one especially dangerous-looking place, I informed my bolder companion that I would proceed no farther. He succeeded in

reaching the pinnacle. While awaiting his return, I employed myself in gathering flowers, and was able to secure some rare and curious Alpine plants. The photographer reported the view from the summit very extensive, and it certainly was grand from where I beheld it.

"I was seated upon the edge of a frightful abyss, and looked apparently a thousand feet down into a small valley, whence the mass of the mountains rolled toward the plain in great brown waves, unsurfed by a tree or any green thing, unless maybe a straggling juniper. The hills were covered with the sage or artemisia, but even that is of an ashy hue, in common with most of the desert plants. The great valley of the Humboldt, stretching to the river and beyond, was equally barren, and then arose the Trinity Mountains and other ranges, until a white cap here and there in the distance indicated the dim line of the Sierra Nevada. There was positively no color in the scene, and yet it did not lack for beauty. The soft shades of neutral tint and azure, and at evening the peculiar golden dust thrown over the mountains by the setting sun, are effects that are unique and unsurpassed."

THE SPRING EXHIBITION AT THE ACADEMY OF DESIGN.

AMONG the exhibitions of the past few years of works by American artists, the preëminence seems pretty generally accorded to the one now open at the Academy of Design, for the number of good pictures it contains. Contrasting it with the last exhibition of pictures in New York, about which the public have been much interested—the Derby Collection of Foreign Paintings—we are led naturally to compare the works of our best painters with those of such artists as Bouguereau, Boutibonne, Willems, Merle, and others; and generally we must acknowledge, after careful, and we hope impartial, consideration, that our native works seem, in point of real artistic merit, to be equal to theirs, and to show more activity of mind and less academical mannerism than appear in the productions of these eminent foreign artists.

The collection is, as usual, made up of every variety of subjects, landscapes being largely predominant. Two of the pictures stand out conspicuous in interest above the rest, the one a head—it can hardly be called a portrait, since it is purely an ideal head—and the other a landscape. Many pictures draw attention from their "sensational" qualities; but in the case of both these the striking qualities which fix the mind and eye of the most uneducated in such matters are also those which attract and stimulate the artist and the connoisseur. The head, in the east room, marked 205, the property of Mr. Tilton, and painted by William Page, is without a name. But the verses on the frame of the picture, from the first chapter of John—"Again the next day after John stood, and two of his disciples; and looking upon Jesus as he walked, he saith, Behold the lamb of God!"—and the emblems of a lion, a lamb, and a crown, but still more the character of the head itself, leave no doubt as to its intention to represent Jesus Christ.

The figure is that of a young man of large and powerful frame, a very full forehead and head, and a fair, florid skin. What at first strikes the beholder is the soft mass of reddish, curling hair—the real Titian red—and the beard of a lighter hue, which falls as softly as threads of silk over his chest, its texture plainly showing that it never has been cut, and that its wearer is a "Nazarete." The nose is straight and rather broad, with firm, strong nostrils. Full and very red lips pout out through the tawny beard, and to any one who has an image in his own mind of a suffering and risen Redeemer they suggest too powerfully the earthly side of his nature. Yet the suggestion is but superficial, and it is only a touch of earth; for the lower part of the face is small, the mouth neither large nor powerful, and the fullness and redness of his lips are but the slight link through which the frailties of earth could be apprehended by the spirit which sits behind the wonderful eyes of the picture.

The eyes are really the key to the portrait. His vast head is turned partly down and round over his shoulder, his beard and hair sweeping backward with the action, and the "Lion of Judah" is revealed through the great pale-gray eyes, which are set and formed like those of the king of beasts. The great black pupils also suggest the

lion. But here the animal likeness ends, and the supernatural and typical character of the face commences. Occasionally, but very rarely, in women and young children, we see pale, blank eyes, into which the soul of the person ebbs and flows; and such, though in a wondrously higher degree, are the eyes of this Christ. The face is entirely serious and unconscious, and all the nature of the man seems held in abeyance, waiting the advent of the God. As you gaze into the eyes, capacities of expression are revealed to you—power, thought, and love, and also, what I have never seen in face or picture, the look of the supernatural. The human element seems to be possessed and spell-bound by it, and it affects and enchains the beholder. It is this element, I think, which affects, excites, and repels so many, and which makes the picture seem so strange, so foreign, and so much a thing by itself among the others, that when the eye rests upon it, traversing the walls of the academy, one is startled and almost shocked, and, like a child scared by a ghost-story, tries to laugh, to criticise, and to condemn, and yet, as if fascinated, returns again and again to inquire and to wonder, and, in my own case at least, to finally accept the picture as a work of decided genius and originality.

The truth is, that this picture, like all other works of art, should be judged from the stand-point of the artist, and not from that of other people. We should consider what the artist has sought to convey, and then see whether or not he has carried out his idea successfully. Mr. Page is a Swedenborgian, with views of Christ differing essentially from those now current in the world. According to the Swedenborgian doctrine, the Jewish nation was not selected for the incarnation on account of its excellence, but rather because it was spiritually the worst of mankind. The Lord, in order to raise and redeem humanity, went down to its lowest depths, and was incarnated in a woman who, so far from being of immaculate conception, was subject to the strongest tendencies and temptations of her race, and transmitted those tendencies in their fullest measure to her offspring. The human nature of Christ, therefore, was at first peculiarly human, and combined in itself all the evil propensities which then afflicted humanity, and from which the race would have speedily perished if the divine Creator had not assumed humanity himself, in order to meet evil spirits on their own plane, and, by resisting and overcoming as a man the worst of temptations, put the devils to flight, and thus restored and preserved the freedom of the human mind, to whose very existence freedom is absolutely essential. From this point of view, then, Page's picture must be judged. His Christ is not the conventional Christ of the artists—all sweetness and loveliness, the man of sorrow and suffering—but rather the Christ still contending with the infirmities of his Jewish nature, and still ready to denounce the Pharisees and scourge the money-changers out of the Temple.

The other picture to which I have referred as of surpassing excellence is Mr. Gifford's perfectly lovely landscape, or waterscape, of some "Fishing-boats of the Adriatic," which is so striking, so charming, and has so much artistic subtlety, both of color and in the spirit of the life it depicts, that almost every one is delighted with it, and many regard it as almost the only picture in the collection they would greatly care to own. The scene represents a graceful mass of red-and-yellow sails, swaying and hanging against one another as the boats to which they are attached lie side by side, rocking on the soft ripples of a summer sea. The haze of the quiet heavens hovers over as gentle an ocean, and in the midst of the dreamy scene this group of richly-colored fishing-boats stands out like a jewel. Mr. Gifford's pictures all—so far as I know them—are delightful; and in this one the gradation of tints and shades, as subtle as Turner's, is added to a sentiment so charming, and a study of Nature so faithful, that one scarcely knows which to enjoy most—the imagination of the poet or the skill of the artist. The atmosphere is warm and dreamy; the water is wet and deep and quiet, yet susceptible of being stirred; the gorgeousness of the sunlight transfigures into something almost unreal the soft, heavy-hued bits of color by which the rude Venetian boatmen delight to express all they are able of their sense of a beauty and luxury which seems native to the children of that region; and these various threads of sense and feeling Mr. Gifford has gathered up and wrought into a creation so lovely as to make the heart beat and the pulse bound.

Among the portraits, the two foremost are Mr. William M. Hunt's picture of Mr. William Wardner—No. 266—and Page's head of Wendell Phillips. Mr. Hunt's picture is of an old gentleman, wrinkled and gray. The tone is subdued, and the drawing firm.

As you examine it closely, you see the handling of a master; every touch on the flesh is delicate and precise, looking so slight, but yet so effective! The shadows, all so clear; the textures of flesh, hair, and drapery, so defined and so simply treated—make it really a delightful work of art. There is scarcely a tint which is beyond the most neutral gray or brown; yet through the multitudinous shades the eye travels with ever-increasing satisfaction.

In another key of color, and with different handling, Page's "Phillips" is equally as strong. The texture of the skin and flesh is admirable; the likeness is wonderfully good, and the artistic rendering of details thoroughly satisfactory. Mr. Page's firm drawing and harmonious, subtle coloring, his consummate knowledge of textures and of anatomy, make one feel the flesh beneath the skin, the skull beneath the flesh, and the man behind the wonderful details of the eyes.

After these portraits, one's eye rests with pleasure on two lovely little girls, painted by Staigg—so childlike, so soft, and so delicate, that, if one has any young child of his own, he cannot but wish to see it pictured in the same way. Several portraits by Baker, Huntington, and Gray, are each good representatives of those artists; and there is an excellent picture, nearly a full-length, of George W. Curtis, by F. B. Carpenter. The expression of the figure is dignified and agreeable, and the color of the picture is quiet and in good keeping. As an accurate portrait of an eminent man it must always be a striking and valuable picture. If not very great as a work of art, it is free from conventionalism, and shows earnest and faithful study.

Among the fancy pictures, one of an Italian boy with his fiddle is very real and strong. The picture is simple in subject and in treatment; and this tendency to simplicity and unity of management—one of the best signs among our artists of an increase of real artistic feeling and knowledge—is observable in many of the best pictures. The Italian boy, leaning on a balustrade, supports his fiddle in one hand. The painting is entirely unpretending in light and shade and in color. The paint is scarcely more than "laid in," with little attention to intricacy of drawing; but there is a remarkable force in the figure, in the unity of tone, and perhaps next to this feeling of oneness in the painting is the admirable development of the fiddle. All the colors in it are kept subdued to the general effect of the picture, and yet the artist evidently loved it as much as its young owner, and has modelled and formed and developed it with the greatest care.

165, "The Mower," by Constant Mayer, is another remarkable picture. A strong man, muscular and full of life, cuts swaths with a suggestiveness and force which make us forget the farmer, and think of him as some symbolical figure, like Old Father Time. He cuts so firm and clean, you pity the blades of grass beneath his scythe, and involuntarily think of a Fate, or the "Reaper whose name is Death," or some other inexorable force—the tall trees behind him, with wan, outstretched arms like the weird sisters, urging him on. Yet the picture is intensely realistic. The flesh, anatomy, motion, and dress of the man are evidently studied very closely from life. The tone of this picture is somewhat inharmonious, and the figure a little "hard," in artistic parlance; but the strength of the drawing, as well as the conception of the picture, renders it one of the most interesting in the academy.

Among all the pictures scarcely one seems to afford such unalloyed pleasure as Eastman Johnson's "Old Stage-coach." A long strip of grass under a New-England sky, on one side of which is an overgrown nursery or half-cleared bit of undergrowth, on the other the children's home, above which birds are fluttering, while at the side of the house is an old apple-tree, which would afford a good companion-piece to the stage-coach; for what boys and girls have not some time in their life played "house," or told stories, or at any rate had their favorite "perches" in such an old tree in the yard at home in the country? The grass strip may be an overgrown ox-team path leading down into the farm, whence loads of hay are drawn in summer, manure carted to the fields in winter, and loads of apples brought before Thanksgiving; or the strip of grass may be merely a grass-plot behind the barn, where dandelions can be dug in spring, and stray clumps of white violets grow. On this grass is stranded an old stage-coach. I remember an old sleigh which afforded me the same sort of fun as Eastman Johnson's girls and boys are enjoying. But I must not digress, but describe the picture. A dozen children or so are playing stage-coach. The off-horse and the near horse, the

leaders and the driver, are all children. Two passengers on the top, little misses—would-be ladies—perk and prink, and chatter and talk gossip. Another child beckons and signals to a mother-child and her little one to hurry up to "take the coach." In the mean time one boy-horse is restive, another pulls patiently, and the driver looks solemn. Any one studying at the picture feels it an echo of some forgotten memory of his own youth—or pity if he does not!

The "Street Fire," by S. J. Guy, is another interesting picture of the same class. Carefully drawn and pleasant in color, the faces of the many children engaged in building their little fire of chips by the side of the street are beautifully painted.

"Saturday Afternoon" and "The Clock Doctor," by E. W. Perry, are also exceedingly pleasing pictures—interiors both, one of an old New-England kitchen, its furniture all in order, and the old dishes, pots, and pans, shining and clean on the high dresser; an old gray-haired woman sits before the open fireplace, her knitting resting on her knee, and she reading her Bible. Mr. Perry's pictures of this phase of New-England life are very valuable historically as well as for the good works of art that they certainly are. His pictures grow finer every year. The color is good, the handling also, and the treatment is constantly more excellent. The other picture, "The Clock Doctor," is of an old man taking a clock to pieces, in which operation a little boy is greatly interested, and the face of the little fellow is exceedingly lifelike and animated.

"Dreaming of the Sea" is another very striking picture by Eugene Meeks.

The landscapes are many of them excellent.

152. "Twilight on the Western Plains," by Samuel Colman, seems to us to be one of the best of Colman's works we have seen for a long time. The scene represents a wide reach of prairie which leads the eye back and back over an almost unending distance, but it is chiefly from the expanse of sky and the varieties and terminations of the different cloud-formations—from the immense masses of nimbus cloud rising dark in the nearer sky and retiring till we see the lower margin lying gray in the distance—that we feel the measure of the vast prairie. The picture is sensuous, like every thing of Colman's, and the "keeping" is, of course, right, as his paintings always are; but there is more vigor than usual with Mr. Colman, and the delicate pencilling of the pale-gold cirrus about the setting sun contrasts finely with the purple mass of the heavy nimbus cloud, which, from its gradation, recalls the skies of Turner to one's mind. There may be some monotony in the main forms when viewed from a distance, but the whole picture strikes us as one of Colman's best recent productions. It is without the *prettiness* which has been painfully conspicuous in his works of the past few years, and has more of the fresh feeling of Nature, which, though not art strictly, in great measure makes pictures valuable to own, and always interesting to their owners.

157. "Lake Conesus," by Kensett. Scarcely any interpretation of any variety of Nature by Kensett ever comes amiss, and, whenever we see a new subject treated by him, we always wish that he would paint all the different phases of at least American scenery. Byron's poetry, and Shelley's, and Wordsworth's, "add the gleam" to what they sketch, and it seems to us that Kensett, in an eminent degree, will give the charm of association of ideas to every different phase of American scenery that passes through the crucible of his imagination. This little, quiet, gray Lake of Conesus, one of the large cluster of the same sort of lakes and landscapes in Western New York, about which Americans know so little, and yet which are as lovely as the lakes of Westmoreland, or almost any in their pastoral loveliness which poets have made famous, deserves to be subjected to the test of such an artist's alchemy as that of Mr. Kensett. The lake, with its border of low hills, and large, drooping, autumn-hued trees, lies before us—a crystallized memory of the same sort of a day which we spent sometime ago on its borders. We wish *such* artists as Kensett would touch and render immortal a great deal more of the almost unknown region of this country.

To anybody familiar with mountain-scenery in autumn or winter, James M. Hart's "Winter in the Adirondacks" recalls the days, when, wrapped up in great-coats and furs, and seated by the driver on the top of a White-Mountain stage-coach, you have rattled over the frozen earth, or creaked quietly along the slightly-thawed ground. In this picture of Hart's, dark masses of the Adirondack Mountains rise before you, their blue sides broken by patches of

snow, ragged and half-seen through the leafless branches of the bare trees, which cover the hill-sides nearly to their summit. You can almost feel the quiet, thin air from the blue December sky, and the dreary mountains, as in imagination you drive down the road over the hill-side—the bare trees and

"Brown skeletons of leaves that lag
My forest brook along!"—

mixed with straggling patches of snow at the side of the road, have the true smack of half-frozen December and March days, and the impression is made still more vivid of the weather and time of year by the absence of sunshine anywhere; the light only coming through a broad patch of what may be a snow-cloud later in the day, and from the cold, still, blue sky. As a work of art this painting is well colored; beautiful purples and blues in it are mingled with many rich tones of brown; the drawing is also quite good; and the study of Nature most obviously faithful.

Wandering through the south room of the Academy, the visitor returns often to stand before a quiet English scene, so idyllic as to seem an embodiment of one of Tennyson's poems, and so excellent in tone and thoroughly well drawn that no lover of art could pass it without high praise.

The scene is painted by A. F. Bellows, and is called "A Sunday in Devonshire." It represents a country-road between thatched cottages and a willow-bordered stream on one side, which might be the one where her lover first caught sight of the "miller's daughter:"

"Then leaped a trout. In lazy mood
I watched the little circles die,
They passed into the level flood.

I loved the brimming wave that roams
Through quiet meadows round the mill.
The sleepy pool above the dam,
The pool beneath it never still."

Great light-flecked English elm-trees stand about the houses, and, through the warm, sunny air, they rise at different distances, growing gray and flat under the soft atmosphere which lies between them and the near foreground. Pearly masses of cloud float in the quiet blue heavens, saturated with light, which catches on the wings of doves circling about the dove-cotes, on the brown and yellowish wisps of straw on the eaves of the cottages and among the leaves of the trees. The church-spire fades away in the sunny distance, and down the streets groups of people are wending their way toward it.

The picture is remarkable for its perfect "keeping." Though it is nearly all painted in solid color, without resorting to glazings or any of the arts which bring a picture into harmony, not a point strikes the beholder as crude or conspicuous above the rest; but browns, grays, and the positive colors, all merge and harmonize into one of the pleasantest and sweetest of landscapes.

Among the good landscapes, two or three by Louis C. Tiffany are capital studies of color. One by Frederick D. Williams, "Clearing off cold," though a very simple subject—a hill-side, a bit of road, and some wind-tossed trees—is the best of his that we have seen. "Twilight at Dachau"—a small picture—is finely felt both for general harmony of color and in the foliage. "The Genesee Meadows," by J. W. Casilear, is a lovely painting. The trees, sky, and meadows, are exquisitely drawn and colored, and the sentiment is poetical and true. "The Narrows in Lake George," by D. Huntington, is another of the best.

We are very glad to see so many really good paintings by lady artists. Miss Fanny Eliot is represented by one or two paintings of real merit. The delicacy and subtlety of color remind one of Colman and a little of S. R. Gifford; and Miss Mary Kollock shows a capital feeling and eye for color in a view in Orange County in this State. Miss Kollock's pictures have struck us as remarkably good, both in this exhibition and in those of the lady-artists in the Mercantile-Library Building. A little like Inness and Gay, they are yet more like those of about the best lady-painter of landscapes in this country, Mrs. Sarah Darrah.

To mention all the pictures which are worthy of notice would be impossible in so short a sketch as this, and these imperfect descriptions have no claims to be exhaustive criticisms of even the best pictures of the Exhibition.

SUSAN NICHOLS CARTER.

SNAKES AT THEIR MEALS.

A WRITER in the English *Naturalist's Note-Book*, who has recently witnessed the feeding of the serpents in the Zoological Gardens in London, says that they are fed once a week, though some of them, and in particular the pythons, do not take their food so often, but will eat enough at a meal to last for weeks, and even for months.

Disregarding the scientific divisions of the order which comprises these animals, we may divide them into three classes: firstly, those which seize their prey with their teeth, and crush it in their folds; secondly, those which seize and swallow it alive, after the manner of lizards; and, thirdly, those which bite, or rather strike it with poisonous fangs. Of the first, the finest examples are the pythons and boas, besides which there are the yellow snakes of the West Indies, and others. Those of the second are fewer in number; they include the rat-snake of Bengal, viperine snake, English snake, etc. The present specimens of the third class include rattlesnakes, and Indian and Egyptian cobras, water-vipers, etc.

The constricting serpents, as we may term them, are kept in large cases, the entrance to which is either by a glass door in the front, which opens by a sliding up, or by a similar contrivance at the back, in the wooden partition. The colubrine snakes are in some of these cases generally, and indeed are so harmless that little precaution is needed. The venomous serpents have no opening but a small one on the lid of the case, about two or three inches square. Through this their food is introduced; and all necessary operations for the cleanliness and order of the interior are performed with a rod of stout wire, to the evident disgust of the occupants, who, if new-comers, strike at it vigorously with their fangs. The first to be fed were the yellow snakes and other species in the same case. The keeper, having unceremoniously removed the blanket, beneath which most of the occupants of the compartment were huddled together, as usual, quickly introduced under the glass door about a dozen sparrows and one or two Guinea-pigs. The former immediately retired to the darkest corners, seeming, however, to be quite unconcerned as to the presence of the snakes, as in some cases they stood on the bodies of the latter, which for the most part remained motionless. The Guinea-pigs were more restless, moving slowly about as if in search of food. They seemed to be preferred by the snakes to the sparrows; and presently one of the reptiles, waiting his opportunity, seized a Guinea-pig by the neck, and, jerking it nearer, threw two or three folds round it, killing it in a few seconds.

The other snakes rapidly dispatched the sparrows in the same way when seized; but they were apparently in no hurry, as there was a number of the birds in one corner for more than an hour, which had not been touched during that time. It may be well to remark that there is nothing revolting in the spectacle of a serpent taking its food. Its victim suffers neither the mental nor bodily torture ordinarily supposed. When seized, it is killed without delay, especially if it struggles to escape; and before its seizure it is never conscious of danger. Not only is this well known to those in charge of the creatures, but we can verify it from actual and careful observation. A rabbit will approach a snake out of mere curiosity, and, after sniffing at its head, and even being touched by its tongue, will start to another part of the enclosure, and resume its composure, returning again in the course of its explorations to the same snake without the least uneasiness, except what arises from a want of cabbage-leaves and the indigestibility of the gravel flooring. Guinea-pigs show even less concern, and are not so easily startled by any moving object.

The snakes which had seized the sparrows, etc., waited till their prey was quite dead before they uncoiled, and began slowly to prepare for swallowing it. The pythons, which occupy an adjoining case, and are the largest serpents in the collection, were next supplied with two or three ducks. The largest python instantly seized one, and threw one fold round it. He then remained perfectly motionless, appearing to be satisfied with having secured the bird, and did not at once kill it. The duck did not seem at first much concerned at such unusual treatment, but soon became restless, on which the python tightened the fold, and in about a minute had quite destroyed it. Having waited for some minutes, as if to make sure that life was extinct, he slowly unwound his coil from the body, and touched it with his muzzle, moving it about till he had found the head. The idea of lubrication with

saliva, now quite exploded, evidently arose from this habit of feeling over the body with the mouth. Having taken the head into his mouth, he began to swallow the carcass, his jaws stretching to an immense extent to allow of its passage. When he found any difficulty, he used the part of his body which lay nearest to it to push it gently, and, considering the apparent difficulty, was not long in completing his meal. The supply of food is never stinted, and we believe that it is not uncommon for a python to devour six or eight ducks and rabbits on one day. Of course a full meal takes a long period to digest, as is the case with all reptiles.

The colubrine snakes might with propriety be termed legless lizards, as, with the exception of the want of limbs, they are in most respects similar in structure to the saurians. A fine, lively specimen of the Bengal rat-snake was fed with half a dozen frogs, which he pursued with great speed round the enclosure, and, driving them one by one into a corner, seized and swallowed them in spite of their struggles.

The keeper having put two young Guinea-pigs into the case containing the rattlesnakes, one of the snakes instantly struck at that nearest to him. The action of a venomous serpent in wounding an animal cannot strictly be called a bite, as, though the fangs undoubtedly represent teeth, the jaws are not closed upon the object struck, which is simply punctured, the snake in most cases retiring immediately. The Guinea-pig almost immediately showed signs of giddiness, but its body did not appear to swell; it seemed to be thrown into violent convulsions, and in about a minute fell helplessly on its side, with no other sign of life than occasional spasmodic motion of the jaws. A larger animal would not have been so soon killed; but as the snakes, being confined, have not often occasion to use their venom, it is probably more powerful than when they are in a wild state. There are a large number of puff-adders in one case; and a Guinea-pig being introduced began sniffing about as usual; but though he was touching one of the reptiles, it did not seem disposed to strike, when suddenly another puff-adder darted at full length from an opposite corner, and, striking the creature, remained with its fangs apparently buried in its flesh, contrary, we believe, to the usual habit of the reptile. His intention was perhaps to prevent any of the others from devouring it.

There are specimens of the two species of cobras, the Indian and Egyptian; perhaps the most interesting of all serpents: but, on account of their excitable nature, it has been found necessary to hide them partially from view by filling the lower half of the case-front with ground-glass, so that it is not easy to observe them. The appearance of the cobra when about to give the fatal stroke is graceful, and yet terrible to see. The inflated hood, the waving motion of the head, and the peculiar expression of the eye, combine to impress the observer of its consciousness of the deadly power which it possesses, and with which it threatens any living creature that dares approach it.

SONNET

To .

(Paraphrased from the Italian of Redi, 1532.)

THY path leads skyward, where Fame's uppermost height
 The sun-dawn clasps! Mine downward toward the gloom
 Of unknown shades! For thee all roses bloom
 Of life and art—for me but flowers of night:
 The gales grow gentler, the bright ways more bright,
 As—buoyed by each brief pause—thou dost resume
 Thy radiant journey, while dark clouds of doom
 Rain on my path Avernian, bale and blight!
 To thee each cordial hour rich largess brings
 And consummation of supreme desires;
 Each toil uplifts thee, as with heaven-bound wings,
 To me wan Ruin cometh and slow Despair,
 With ghosts of passion crowned by flickering fires,
 And phantom hopes that fade in twilight air!

PAUL H. HAYNE.

TABLE-TALK.

IN the London *Spectator* we find a very interesting essay on the "Artistic Feeling of the Lower Animals," prompted by the theory of Mr. Darwin that the striking beauty of the plumage of birds, and the rich colors of certain other animals, have arisen from so marked a preference among these creatures for beauty of exterior that the more beautiful have always been able to secure more eligible mates than the less beautiful, and hence, during a vast number of generations, there has been a gradual accumulation of beauties in the species. But, in accepting this theory, how are we to account for the fact that the development of color in animals is always toward a perfectly artistic harmony? "There seems no reason to doubt," says the *Spectator*, "that birds are extremely susceptible to the effect of beauty of plumage and voice, and are jealous of the same attractions in their rivals. Admitting Mr. Darwin's hypothesis, only conceive what refined and finely-developed taste it implies in these birds at once to prefer those variations of plumage and voice that tend to perfect harmony of effect! If we notice the preferences of the least-cultivated classes of civilized human beings in relation to color—say the ordinary preferences of English sailors or English maid-servants—we might safely assume that they would *not* be directed toward perfect harmony of color and perfect grace of form, but rather to startling and blotchy effects in both color and form. But the splendidly-colored snakes and birds of tropical forests, however grand their colors, are never what our taste would call vulgarly colored, never coarsely patched with frightful patterns, such as you constantly see on gaudy gowns, showy wall-papers, and glaring carpets. Yet, if the tastes of snakes and birds be not of a wonderfully delicate and cultivated character, how are we to accept Mr. Darwin's theory? Why is the order of development always from less beautiful to more, instead of in the reverse direction toward gaudy vulgarity and detestable splendor? 'The elongated and golden-orange plumes which spring from beneath the wings of the *Paradisæa apoda*,' says Mr. Darwin, 'when vertically erected and made to vibrate, are described as forming a sort of halo, in the centre of which the head looks like a little emerald sun, with its rays formed by the two plumes. In another most beautiful species the head is bald and of a rich cobalt hue, crossed by several lines of black velvety feathers.' Well, why did not development of the plumage most pleasing to these little creatures bring out instead something as ugly as the British matron's orange turban, surmounting a rich salmon-colored silk dress? Mr. Darwin accounts most ingeniously for the wonderful development of rich plumage—if he only gave us any equally adequate account of the wonderful development of animal taste. How did the preferences of the various tribes of creatures happen to select harmonies so perfect, when the rudimentary tastes of partially civilized human beings seem to select ornament so hideous?" This singular and certainly interesting problem the *Spectator* proceeds to solve by showing that, as in case

of instinct, when reason begins to supersede it, we gain a far higher and wider power—the power of laying the intellectual basis of our own rules—at the expense of a great specific loss of practical skill. No one supposes that the hexagonal cells of bees are built by true bee engineers who have studied the trigonometry of the subject, and yet men who have studied it would be puzzled to build so perfectly. Something of the same kind is probably true of the sense of beauty. The Creator clearly gives to the lower order of animals an instinct of beauty ready made, which we lose as we become competent to apprehend its laws, and which we only recover by mastering consciously those laws of harmony which the bird apprehends instinctively. "The instinctive taste for beauty in animals," continues the *Spectator*, "which is so much greater than that of half-educated human beings, and which is only painfully recovered through the laborious study of Nature by educated intelligences, must come from a fountain of infinite love of beauty, and cannot by any possibility be the mere result of a competitive struggle for existence among animals quite unconscious whither the issue of that struggle tends."

— The recent brutal murder of a citizen in a street-car, whose sole provocation of the assault was a resentment of the assassin's impertinences toward ladies in his charge, has elicited not only intense indignation, but many expressions of well-founded apprehensions as to the safety of persons who are compelled to travel in these vehicles. The outrageous fact that the murderer of Mr. Putnam was in part aided and abetted by the driver and conductor of the car, has called forth no little denunciation of the officers of the railroad-lines, under whose management such things are rendered possible. Here was a citizen assaulted unto death directly by the coöperation of the car-driver, and as a consequence of the flagrant indifference of the conductor. But this murder is only the crowning act of a long series of abuses which the New-York public have endured at the hands of car-officials, whose insolence and brutality have become proverbial. But in the indignation excited by Mr. Putnam's murder, and in the general demand for a sharp and prompt reform, we have seen no practical suggestions as to the remedy needed. This, we conceive, should be radical in order to be effectual. The public of New York are brought more frequently into contact with car-conductors than with any other class of public servants. Ladies and children are continually dependent on them for protection. The number which at any given moment are under their care, is very large—probably, during the principal hours of traffic, as many as ten or fifteen thousand. This shows how important it is that car-travel should be safe and orderly. Now, the only method to secure these ends is to adopt a plan which we are under the impression has recently been put in practice in one of our sister cities, and organize the entire body of car-conductors as a police—uniformed and disciplined like a police, having the same power to enforce order and to make arrests that the police have, and be amenable to the same strict discipline that the police are. This might be brought about by a law requir-

ing that every car-conductor should be licensed by the Police Commissioners, or by legislative enactments, which have been suggested frequently, placing the whole direction of the car-lines under the control of a government commission. Whatever may be the method, let the thing be done. While this plan would give more power to conductors than now, it would lead to the selection of a better class of men—which, to secure, better pay should be given—and render each man strictly amenable to a rigid discipline. There would be protection then for ourselves and families, and direct redress in case of insolence or neglect of duty on the part of the official. In the coming years the necessity of a well-regulated car-system will become more and more important and urgent. Our citizens cannot always in their comings and goings be at the mercy of a rude, ill-bred set of barbarians. We hope our contemporaries of the daily press will see the advantage of our proposal, and be induced to urge its adoption upon the powers that be.

— A correspondent of one of our daily papers suggests that statues to such worthies as Columbus, Hudson, Peter Stuyvesant, DeWitt Clinton, and others identified either with the discovery and settlement of the continent, or with the development of our greatness, be erected within the numerous small triangular enclosures in our city, which our commissioners have recently been trimming up and setting in order. The idea is a good one. But who is to erect these statues? If we wait for government, we may rest assured that the work will never be done. Nor is it clear that the erection of statues is exactly within the province of government. In America, all enterprises of the kind ought to be undertaken by private hands. Now, if a Metropolitan Art Association were organized and chartered, which should have in view the adornment of the city in the way proposed, we believe that sufficient funds for the purpose would be contributed by our citizens. Whatever adds to the beauty and attraction of the city, adds to the population and draws more numerous visitors, thereby increasing the value of property, and advancing the general prosperity. Our wealthy citizens would, no doubt, in full realization of these facts, contribute liberally for such ends as the association would have in view, and funds could also be raised by public entertainments, such as fairs, concerts, art exhibitions, etc. Such an art association would not need to limit its labor to the erection of statues; fountains, monuments, towers, and all forms of ornamental architecture of a purely art character, would be within its scope to attempt. The association should be composed of responsible and well-known citizens, and the execution of its designs should be intrusted to those of the best art-culture. The idea we offer is entirely practicable, if taken hold of with sufficient energy. No very large sum would be needed for the initial efforts of such an organization, and the erection of one successful statue would immediately enlist a very general interest in the purposes of the association.

— It is proposed in London to suppress street-mendicancy by giving the police power

to arrest the giver of alms as well as the receiver of them. A similar law, it is said, was in operation under Henry VII., and Sir Charles Trevelyan has been conspicuously advocating a reenactment of the decree. "It is easier," thinks one commentator, "to clamor against such a law than to show why an educated person, aware that enormous sums are annually paid for the lawful relief of real distress, deserved or undeserved, and that almsgiving fosters all kinds of imposition, should not be mildly and formally reproved by a magistrate for sinning against common-sense?" If every man or woman, "sinning against common-sense," should be summoned before a magistrate for reproof, our police-courts would soon be more numerous than our shops. Alms-giving may be quite as injurious as Sir Charles Trevelyan thinks, but, if he should make an attempt to suppress it by a law such as he suggests, he would soon convert the entire community, out of sheer obstinacy, into persistent and even belligerent alms-givers. "Sha'n't we do with our own as we like?" would be a new watchword, and the beggars would fatten on the sudden and surprising harvest.

— A gentleman in London, found guilty of having three wives at once, pleaded in extenuation that no offence had been committed, inasmuch as he had been at the expense of maintaining them all. Instead of failing in his duty as a husband, he had performed it three times over, and he asked if it were not nobler to support three wives in comfort than to abandon one in indigence. This logic, which in certain places would have been so conclusive, failed to convince the prejudiced and unenlightened court, and the too-ambitious reasoner and too-many Benedict was sent to digest his argument at his leisure under lock and key. With what an unequal hand is justice dispensed! Why did not our eloquent and clear-headed pleader take his wives to Utah? Or why did not he remove to Indiana, where he might marry as often as he pleased, with only the slight and very brief interposition of divorce-suits? A man so anxious to overdo his duty ought to have emigrated to shores where his zeal would have been understood.

— It is stated that among the Scotch peasantry the laborers hold that they cannot afford to marry unless they are sure to have children, so valuable is juvenile labor in agricultural districts. Here is a surprising reversal of the current economic doctrine on this point. As the poor are accused of disregarding the admonitions of Malthus and his expounders out of sheer obstinacy, perhaps with equal obstinacy the poor in Scotland may be refusing to marry, when, according to all law of economy, they ought to do so. And yet the humane reasoner would just here be anxious to see the Malthusian principle introduced. Marrying in order to obtain children as a source of profit is more repugnant than imprudent marriages without means to support children. In the latter enter at least certain human affections; in the former there is a cold calculation that we should hate to see general. When the mo-

tive for bringing offspring into the world becomes not parental affection but profit, human nature will have sunk low indeed.

Correspondence.

To the Editor of Appleton's Journal.

SIR: Allow me to correct some inaccuracies in Mr. Morgan's article on "Oxford." He says that "there are two grades of students in the English universities, first the 'fellow-commoners,' and second the 'commoners,' of whom the first sit at the Fellows' table and pay a higher rate. . . . The titled gentlemen are expected to enter as fellow-commoners, and the untitled as commoners, although either course is free to all. . . . So overshadowing is the law of caste in this country that I presume an untitled gentleman would not presume to enter himself as a fellow-commoner," etc.

The first error here is confusing the terms proper to the universities. These are respectively, at Cambridge, *fellow-commoners* and *pensioners*; at Oxford, *gentlemen-commoners* and *commoners*. (Noblemen form a distinct class at both universities, usually eldest sons of peers, sometimes peers in their own right.) The second mistake is Mr. Morgan's fancy that the fellow-commoner is always a titled man. *The very reverse is the case.* The fellow-commoner proper, who wears a cap, is always a man without a handle to his name. There is, indeed, a *hat-fellow-commoner*; this variety of the species is an "Honorable." I believe there is nothing at Oxford answering to this Cambridge subdivision, so that many of the gentlemen-commoners there are honorables (younger sons or grandsons of noblemen, having this title by courtesy, not in law); but others are not.

Neither does an honorable necessarily enter as hat-fellow-commoner. Many of them are pensioners, both on account of the difference in expense, and because the college honors, which are also emoluments—namely, the scholarships and fellowships—are not open to fellow-commoners. Being a fellow-commoner at Cambridge merely presumes wealth; it does not necessarily imply even that—at least not great wealth. One of the Trinity fellow-commoners in my time had been a colonial editor, and afterward became a master of a public school. Men who go into the Church comparatively late in life (say thirty or older) are generally fellow-commoners at the smaller colleges, because they prefer to associate with men of their own age, and at Cambridge fellows, fellow-commoners and noblemen, sit together; whereas, at an Oxford college, every class, even if comprising only one member, has a table to itself! I began at Trinity as a fellow-commoner, in order to have the Fellows' society, but afterward turned pensioner for reasons already intimated; it cost less, and I wanted to get a scholarship.

Mr. Morgan also says: "It would be natural to suppose that the million dollars of annual income would cheapen education at the several colleges of this university; that it would make tuition and room-rent substantially free, or at least free to the poorer class of students, but it does not seem to take this direction."

I am unable to state exactly the nature of the allowances made to the servitors (that is, I believe, the Oxford term corresponding to the Cambridge sizar), but they must be considerable, otherwise these young men would hardly present themselves in *forma pauperis*. The education of the Cambridge sizars is certainly very much cheapened. At Trinity they are fed

for nothing, taught for half price, and (I think, but am not quite sure) lodged at a reduced rate. At St. John's they are still better provided for. Scholarships, studentships, and exhibitions, do certainly also "cheapen education." I suspect there is not a single college in either university, having poor students, which does not make ample provision for them. Some of the colleges have no poor students, such as Downing, at Cambridge, All Souls' (which has no undergraduates at all), and (I presume) Christchurch, and some of the Botany-Bay halls at Oxford.

While I am writing to you, I may as well append two remarks on Mr. Crane's paper. "American Patrozymics" (the accuracy of the title may be questioned, but that is not one of them). He evidently considers *Skyler* the Dutch pronunciation of Schuyler. The Dutch *ch* is a fearful guttural, scarcely to be pronounced by an Anglo-Saxon, wherefore it was modified into the nearest corresponding sharp, just as the French change the old guttural Spanish *x* into *k*, and say *Keres* for *Xeres*. One of the Dutch dialects (according to Mr. A. J. Ellis) gives to *ch* a sound resembling *r* or *hr*, but the usual force of the combination is guttural.

Mr. Crane thinks it something ridiculous that a family should be supposed to have the same name as a town. Yet this is one of the most common origins of family names, especially in a colonized country like ours. A man who has the same name as several others is further distinguished by adding the place whence he came, and this, being the most prominent part of his appellation, ends by absorbing the original family name. The first Brevoort in New York was a Jansen who came from the fortified town of Brevoort, or Bredevoort (= Bradford) in Holland. Some very curious English names are derived from places. *Venus* was originally *Venice*; probably the first bearer of the name either traded with or had lived in the Italian city.

C. A. BRISTED.

Literary Notes.

"FRAGMENTS of Science for Unscientific People," by Professor Tyndall, which will appear in May from the press of D. Appleton & Co., is a collection of the various essays by Professor Tyndall that have from time to time appeared in the English periodicals, many of them, on the occasion of their appearance, exciting a profound sensation. The collection gives us some of the best productions of one of the most brilliant and interesting of living writers. Dr. Tyndall occupies a unique and remarkable position in the world of thought. Ranking high in science as an original explorer, safe, cautious, and trustworthy, in his statements, he at the same time stands, perhaps, equally high in his literary accomplishments. His language is notably clear, vivid, and eloquent. He has a marvellous power of painting with words, and he goes with his pen where pencil and brush can never go. With his magical descriptive power he brings out the most abstract subjects and the subtlest order of invisible changes, so that they stand before the eye of the imagination with all the visible sharpness of stereoscopic perspective. Tyndall is also a man of enthusiasm, and his writings are tinged with a glow of feeling which stirs the noblest sentiments of his readers. Though dealing with subjects commonly thought dry and repulsive, he lifts them out of the prosaic into the poetic, and, in fact, more than any other living man,

he is the poet of science in our age. In another respect, the "Fragments of Science for Unscientific People," is a very extraordinary book. The range of its subjects is as broad as the scope of modern thought. To Professor Tyndall science is not the mere collecting and labelling of specimens, or the heaping up of endless curious observations. It is nothing less than the disclosure of the Divine order of the world—a revelation of the beauty, harmony, and vital interdependence of all truth. From the dynamics of atoms to the eternal sweep of cosmic forces, he passes without break of continuity, so that his science becomes philosophy, and all his discussions are knit together through the unity and correlations of a universal system of law. Though not aggressive, and never wantonly disturbing men's prejudices, Professor Tyndall, nevertheless, presses his conclusions with unflinching fidelity.

The London *Spectator*, speaking of Trollope's "Ralph the Heir," remarks: "Perhaps there is scarcely any intellectual luxury to which the British public is now accustomed, that it would miss so much as the serials produced by Mr. Trollope's unwearied and unwearable genius. How much knowledge of life, appreciation of its humor, experience of its paradoxes, and mastery of its lessons, is gained at second-hand through Mr. Trollope by men and women who would hardly gain it at all, and certainly not gain any thing like the same amount of it, in any other way, it would not be easy to conjecture; and assuredly any conjecture would be much more likely to fall short of the truth than to exceed it. Which of us can say that we know even our own circle of friends, political and social, half as well as we have learned within the last twelve-month to know Sir Thomas Underwood and his daughters and niece, his ward Ralph, and his ward's cousins; the old squire, Gregory Newton; the Eardham girls, and their scheming mamma; Mr. Griffenbottom, the corrupt M. P. for corrupt Percycross; Mr. Trigger, the Conservative agent for that corrupt borough; and Messrs. Pile, Spicer, Pabsey, and Co., the various leading Conservative constituents of the same corrupt place; or that we know the heart of any person at all resembling the breeches-maker of Conduit Street, nearly as completely as we know that of Mr. Neeft, with the pertinacious and half-pathetic workings of whose vulgar but tough little ambition we have been becoming more and more intimate every month for the last year! To the mass of men, such a novel as 'Ralph the Heir' brings not only a very large increase in their experience of men, but a very much larger increase than their own personal contact with the prototypes, if prototypes there be, of these personages, would ever have afforded them." "Ralph the Heir" will be published in book-form by Harper & Brothers, uniform with their other issues of Trollope's novels.

Arthur Helps has published "Conversations on War and General Culture," in which the reader is admitted once more to the society of the "Friends in Council," and are invited to listen to certain conversations which are supposed to have taken place last summer, soon after the commencement of the Prussian invasion of France. "Culture" and "War" are the principal themes of these conversations, but there are frequent digressions, and almost every matter of current discussion is talked about. The necessity of a wider and more general culture in modern society, and the evils and iniquities of war, are enforced in the conversations with singular eloquence. "The 'Friends in Council,'" says the *Saturday Re-*

view, "are as free from monotony and dullness as when they first communicated their lucubrations to the world," and the *Athenæum* asserts that "Mr. Helps has lost none of his power of writing easy and agreeable dialogues."

Michel Levy, the Parisian publisher, has preserved all the manuscripts of the books which Alexandre Dumas wrote himself. The collection is superbly bound, and looks inside as if it had been written by a teacher of penmanship. Dumas wrote a very fine hand, and hardly ever changed a word in his manuscript. He used to say laughingly to his friends that, as soon as people would get tired of reading his books, he would open a school for penmanship.

Octave Feuillet has written two novels. One is called "Eudoxie," and the leading personage in it is believed to be the Empress Eugénie, with whom Feuillet was intimately acquainted since the year 1848. He always was the favorite novelist of the ex-empress.

Hacklander's famous fairy tales, it has been discovered, were not original productions, as the author claimed, but translations from the work of an obscure Italian author named Cavallo, who died in the year 1805 at Milan.

Booksellers in Germany complain bitterly of the indifference with which the public in that country receives the numerous histories of the recent war. Thus far, it is said, only one of those works has paid expenses.

Kattkoff, the publisher of the celebrated *Moscow Gazette*, offers to pay ten thousand rubles for the best novel, written either in Russian, French, or German, on a Russian subject.

Foreign Items.

THE insurgents in Paris burned the whole collection of Napoleonic relics and curiosities belonging to Prince Napoleon, and which he had not had time to remove to London. The collection was exceedingly valuable, and it had taken the prince nearly thirty years to gather it. It contained, among other curious things, the private travelling library of Napoleon I., with many marginal notes by the emperor himself. The prince intended at one time to publish a collection of these notes, but Napoleon III. would not permit it.

The Emperor Francis Joseph was presented recently by a Galician Jew with an exceedingly fine and very valuable opal. Fifteen minutes afterward the emperor discovered that some one had stolen the precious stone, which he had placed in a casket on his table. Only four persons, all of them belonging to the highest aristocracy, were in the room with the emperor. The opal was not recovered.

The Italian papers deplore the death of Adelaide Cairoli, the patriotic lady of Pavia, to whom the Italian Parliament several years ago voted the thanks of the nation for her devotion to the cause of Italy, as a national loss. Signora Cairoli lost a large family of sons in the wars for the unification of the country, and left her large fortune to the poor of Pavia and Rome.

Prince Bismarck has refused the sum of one million dollars which the leaders of the liberal party in the German Parliament offered to appropriate for him out of the French indemnity fund. In his reply the prince stated that he had as much money as he needed, and, in fact, more than any of his ancestors had ever possessed.

Fanny Lewald, the German authoress, whose books are more popular among the cultivated classes of her countrymen than those of any other German authoress, said recently to a friend that, although she had written a great many books, the compensation she had received for them would not have sufficed to save her and her family from starvation.

The former private secretary of General Juan Prim has committed suicide. It is said in Madrid that he took his own life because he was involved in the assassination of his chief. His name was Ignacio Ballero, and he was a man of great literary ability. He wrote all the famous proclamations which Prim issued during the revolution.

The Count de Paris, the so-called "head" of the Orleans family, has purchased a villa near Elnach, where his mother lived after her expulsion from France in the year 1848. The count's next neighbor is Fritz Reuter, the celebrated Low German novelist.

The water-color paintings of the Empress of Russia, who is an artist of considerable merit, will be exhibited at the principal cities of the empire, for the benefit of the St. Petersburg Orphan Asylum. It is believed that a million rubles can be realized by this exhibition.

It has been discovered that the apparition, the so-called White Lady, at the royal palace in Berlin, where the servants were nearly frightened to death by it, was the work of a mischievous young girl. She will be severely punished for her spectral performances.

The Queen-dowager of Prussia, the consort of Frederick William IV., after being a helpless paralytic for nearly ten years, has suddenly recovered the full faculty of using her limbs again, much to the surprise of her physicians, who had long ago given up her case as hopeless.

In court circles in Munich it is said that King Louis II. has spent nearly the whole private fortune accumulated by his three predecessors on the throne, and that he will soon no longer be able to assist authors and artists as liberally as he has been in the habit of doing.

In the year 1866, when no one had heard yet of Gambetta, Rochefort, who was afterward his colleague, advised Vollemessant of the *Figaro*, for which Gambetta desired to write, not to employ him, because he did not possess sufficient ability.

A man who sold to the Marseilles Library a manuscript volume which he pretended was written by Fouché, Napoleon's minister, but which he was proved to have got up himself, has been sentenced to four years' hard labor.

Biørnson, the Norwegian novelist, has removed to Berlin. He writes German as well as the language of his own country, and will henceforth write exclusively for three German literary papers.

The fortune left by Mirès, the French banker, is said in Marseilles to exceed seventeen million francs. Four times in his long and eventful life he was so poor that, as he himself said, he was barely able to support his family.

The St. Petersburg *Golos* says that the best telegraph operator in that city is a woman, and that so is the most rapid short-hand writer in St. Petersburg.

They say in Berlin that Madame Pauline Lucca, the cantatrice, has more valuable dia-

monds than all the ladies of the imperial family together.

The Princess de Metternich has completed the MSS. of two volumes of "Personal Reminiscences," which will be published this summer in German and French at Vienna.

It has been computed in Germany that the printers of that country lost by their strike last year the sum of 241,000 thalers.

George Sand has, after all, sold her farm at Nohant, and will henceforth reside all the year round at Paris.

The *Neue Wiener Freie Presse* claims to be the most profitable daily paper published on the European Continent.

Frederick von Raumer, the German historian, is dead. He accidentally poisoned himself.

The last words of Admiral Tegethoff were: "I shall fall asleep and never awake any more."

None of the members of the Parisian Commune are able to write correct French.

There are more noblemen than burghers in the German Parliament.

Alfred Meissner's novels have been placed on the pontifical index.

Miscellany.

Modern Fortunes.

THE fortune bequeathed by the late Mr. Brassey, the contractor, is probably the largest which ever passed the English Court of Probate—for the very few estates which exceed his in value are usually transferred by settlement. This fortune is believed to have exceeded seven millions sterling, the personality alone having been sworn under six and a half millions. With the possible exception of an instance in the history of the Rothschild family—a family of whose colossal wealth everybody talks, while nobody knows very much—and the doubtful exception of Mr. Vanderbilt, reported by New-York gossips to possess nearly a hundred million of dollars—this is certainly the largest amount of money ever accumulated by one man by industry and enterprise, during his own lifetime, and its bulk suggests that some great change must have passed over the fortune-making capabilities of business-men. The area of their operations must in some way or other have been enormously increased, until they resembled the operations of a government rather than those of an individual, until, as it were, they must be enabled to secure the services of entire armies of faithful agents. We believe this to have been the case, and to be due to the operation of two causes, one of them entirely good in its action, the other and more important one very doubtful. The national boundaries formerly fixed to speculation are rapidly disappearing. Supposing that an able man with a talent for business of almost any kind can secure a sufficiency of competent and trustworthy agents, there is no necessity for limiting his work to one country. He can repeat himself, as it were, as often as he pleases, and repeating himself implies a repetition of his profits. Mr. Brassey can only build one railway at a time, be the profit never so great, just as one ambassador can only be in one capital on one day; but Mr. Brassey, controlling a hundred Mr. Brasseys, can guide them as the foreign office guides envoys, and do the same work and acquire the same profits in England, France,

India, and America, all at once. Nothing can stop him except an insufficiency of agents, and it is just at this time that the reservoir of agency has begun to widen and deepen. In many departments of life individualism has ceased to pay, the able man with little capital getting more and rising higher by entering the service of some commanding capitalist. The capitalist can pay him as a premier is paid, and is willing to pay him, because he is able thoroughly to trust him. The greatest of all obstacles to an unlimited employment of agents was once the fear of rivalry. "If," said the employer, "I make that man as competent as myself, he may set up for himself and take some of my business away." The agent, however, of a man like Mr. Brassey, has none of that temptation. If he set up for himself, he could not do the same business—business profitable mainly on account of its scale—and, if he could, it would, considering the risk, scarcely be worth his while. If he is the kind of man who succeeds, his employer will see that it is made worth his while to succeed for him instead of for himself, to use vast means for another instead of small means on his own account. The agent is bound to fidelity by every vulgar as well as every lofty motive, and his employer no more fears his rivalry than the Hohenzollerns fear that of Bismarck or Von Moltke. Of course, when ability seeks service as more profitable than independence, able agents, willing always to be agents, become plentiful, and there are potentialities of wealth in that new relation of agent and master almost beyond the dreams of avarice. If a man of ability and capital can do one thing best, and can secure such agents, nothing prevents him from doing that one thing for the whole world, drawing the whole profit of that branch of dealing, or manufacture, or enterprise, throughout the entire world, and so realizing a fortune never yet heard of.

Gran'ma al'ars does.

I wants to mend my wagon,
And has to have some nails,
Jus' two, free 'll be plenty,
We're going to haul our rails.
The splendidest cob-fences
We're making ever was,
I wish you'd help us find them—
Gran'ma al'ars does.

My horse's name is Betsey,
She jumped and broke her head;
I put her in the stable,
And fed her milk and bread.
The stable's in the parlor,
We didn't make no muss,
I wish you'd let it stay there—
Gran'ma al'ars does.

I'se going to the corn-field,
To ride on Charley's plough,
I'spees he'd like to have me,
I wants to go right now.
Oh, won't I "goe up" awful,
And "whoa" like Charley whoas,
I wish you wouldn't bozzer—
Gran'ma never does.

I want some bread-and-butter,
I'se hungry worstest kind,
But Taddy musn't have none,
'Cause she wouldn't mind.
Put plenty sugar on it,
I tell you what, I knows
It's right to put on sugar—
Gran'ma al'ars does.

Over the Ocean.

Curtis Guild's new book, "Over the Ocean," is one of the liveliest volumes of for-

eign travel that has been issued from the press for some time. The following extract gives the author's impressions of London streets:

"I thought my experiences in New York streets had prepared me for London; but on emerging into the London streets for the first time I found my mistake. I was fairly stunned and bewildered by the tremendous rush of humanity that poured down through Oxford street, through Holborn, on to the city, or otherwise down toward White Chapel, Lombard Street, the Bank, and the Exchange.

"Great omnibuses, drawn by three horses abreast, thundered over the pavement; four-wheel cabs, or 'four-wheelers,' a sort of compressed American carriages, looking as though resuscitated from the last stages of dissolution, rattled here and there; the Hansom cabs, those most convenient of all carriages, dashed in and out, hither and thither, in the crowd of vehicles; great brewery drays, with horses like elephants, plodded along with their loads; the sidewalks swarmed with a moving mass of humanity, and many were the novelties that met my curious eye.

"The stiff, square costume of the British merchant; little boys of ten, with beaver hats like men; Lord Dundrearys with eye-glasses such as I had never seen before, except upon the stage at the theatre; ticket-porters with their brass labels about their necks; policemen in their uniform; officers and soldiers in theirs; all sorts of costermongers with every thing conceivable to sell, and all sorts of curious vehicles, some with wood enough in them for three of a similar kind in America.

"The drivers of the London omnibuses feel the dignity of their position—they do. It is the conductor who solicits passengers, takes the pay, and regulates the whole business of the establishment. The driver, or rather the 'coachman,' drives; he wears a neat top-coat, a beaver hat, and a pair of driving-gloves; he drives with an air. You can attract his attention from the sidewalk, and he will 'pull up,' but he does it with a sort of calm condescension; the conductor or cad, on the other hand, is ever on the alert; his eyes are in every direction; he signals a passenger in the crowd invisible to all but him; he continually shouts the destination of his vehicle, but sometimes in a patois unintelligible except to the native Londoner. As for instance, I was once standing in Holborn, waiting for a 'bus for the Bank; one passed, which from its inscription I did not recognize, the conductor ejaculating, as he looked on every side, 'Abink-Wychiple, Binkwychiple,' when suddenly he detected us in the throng, and marked us as strangers looking for a 'bus; in a twinkling he was down from his perch, and upon the sidewalk.

"'Binkwychiple?'"

"'I want to go to the Bank,' said I.

"'All right sir; 'ere you are.'

"He gave a shrill whistle, which caused the driver who was sixty feet away, to stop, hurried us both into the vehicle, slammed to the door, and, taking off his hat with mock politeness to a rival 'bus that had nearly overtaken him, said 'Can't wait for you, sir: drive on, Bob; and on we went to our destination.

"Another 'bus conductor puzzled me by shouting 'Simmery-Ex, Simmery-Ex, Simmery-Ex,' until the expression was translated into 'St. Mary's Axe,' the locality alluded to. These conductors are generally sharp, quick-witted, and adepts at 'chaff' and blackguardism, and it is good advice to the uninitiated to beware 'chaffing' them, as in nine cases out of ten the cad gets the best of it.

"The Hansom cabs are the best and most

convenient vehicles that can possibly be used for short excursions about the city. A shilling will carry you a smart fifteen minutes' ride, the legal price being sixpence a mile, but nobody ever expects to give a cabman less than a shilling for ever so short a ride. Eighteen pence is readily accepted for a three-mile trip, and it costs no more for two persons than one. There being nothing between the passenger and the horse but the dasher, as the driver is perched up behind, an unobstructed view is had as you whirl rapidly through the crowded streets; and the cheapness of the conveyance, added to its adaptability for the purpose that it is used, makes an American acknowledge that in this matter the English are far in advance of us, and also to wonder why these convenient vehicles have not displaced the great, cumbersome, two-horse carriages which even a single individual is compelled to take in an American city if he is in a hurry to go to the railway station or to execute a commission, and which cost nearly as much for a trip of a mile as would engage a Hansom in London for half a day.

"There has been much said in the London papers about the impositions of the cab-drivers; but I must do them the justice to say I saw little or none of it; making myself acquainted with the legal rate, I found it generally accepted without hesitation. If I was in doubt about the distance, instead of adopting the English plan of keeping the extra sixpence, I gave it, and so cheaply saved disputes.

"Coming out from the theatres, you find privileged porters, who have the right of calling cabs for those who want them, besides numerous unprivileged ones; boys, who will dart out to where the cabs are—they are not allowed to stand in front of the theatre—and fetch you one in an instant. The driver never leaves his seat, but your messenger opens the cab and shuts you in, shouts your direction to the driver, and touches his cap grateful for the penny or two-pence that you reward him with."

The Egyptian Lotus.

A correspondent in Missouri, noticing in an early number of the *JOURNAL* a representation of the Egyptian lotus, writes to us as follows:

"I was surprised and pleased to recognize in 'the Egyptian lotus-plant,' an old and loved friend. Several years ago when duck-shooting on the marshes and sloughs along the Missouri River, I first saw the pea-like seed of this plant. The seeds lay thick about the bottoms of the dry ponds, upon the surface, and embedded in the rich, black, loamy soil. The singular, nut-like seed excited my curiosity, and on searching I found one of the light, spongy cushions in which they grow, and which are accurately represented in your illustration. Since that time I have frequently seen the plant growing, and in certain localities in this State it is quite common.

"On seeing your illustration, I referred to such works on our flora as I had, but could not find this plant among the plates, or in the *indices*; and thinking it might not be generally known, nor, possibly, even by you, I concluded it would not be impertinent in the cause of science to communicate the fact to you.

"Last September, early in the month, while hunting woodcock and ruffed grouse in the southern edge of Saline County, about twenty miles northwest of this place, I came upon a marsh or pond literally covered by the magnificent leaves of this plant. The pond was about an acre in extent, and presented one of the most beautiful sights I have ever seen. The round, green leaves, many floating on the surface of the clear water, the ripe and half-ripe cushions of seeds, and the blooming and full-blown flowers, rich, creamy, and of delicate odor; the thick young woods, willows, and hazels, growing luxuriantly around the edges and at a distance from the pond; the sun shining gloriously down, and my fine

pointer galloping in frolic hither and thither through the water in the dense shade—all this was freshly delightful, and I stood half an hour in intense enjoyment on the edge of the water among the flowers. I brought two fine ones away with me, and kept them a week in my room in town. There can be no mistake about this plant and that shown in your illustration being the same. Here the plant is generally nameless, and the only name I ever heard given it was *Yonquepin*, a name unknown in Webster, who gives *Chinquapin*, a shrub well known in Alabama and the Carolinas.

"The shell of the seed is about the twentieth of an inch in thickness, is with difficulty cracked, and the kernel is dry and yellow, with a dry, green germ in the centre. The kernel is sweet to the taste; the germ bitter.

"I gathered a pocketful of the seeds, for many were ripe and dropping out, though other plants were just blooming, and threw them in a gentleman's pond a mile or two this side of where they grew. Whether the plant will grow there I do not know; but most of the apparent conditions of its existence seemed to be at the second place.

"It blooms from the middle of August to the middle of September. The water in which I last saw them growing was stagnant in some places at the margin; but, farther, in the pond was clear and cold, and about two feet in depth. The pond was about two hundred yards from a large creek, and about the same distance from what is called here 'a salt-lick.'

"Perhaps all these particulars are well known; but my pleasure at knowing the Egyptian Lotus-plant grows wild here, is so great, I was anxious to communicate it."

Goethe.

"The thing that jars upon the mind throughout Goethe's life, in his letters, his books—everything he said and did—is the absence of any thing like devotion to any being, human or divine, morally above himself. God he regarded as inscrutable, and as best left to reveal Himself. The future life was not yet. From all men he withdrew himself in a sort of kindly isolation—sympathizing with them, aiding them, helping them against themselves, understanding them, but never making any of them the object of his life. The object of his life, so far as any man can consciously and permanently have one, was the completion of that ground-plan of character presented to the world in Johann Wolfgang Goethe. To perfect this he denied himself much both of enjoyment and real happiness; to keep this ground-plan intact, or to build upon it, he was always ready to sacrifice either himself or anybody else. To this he sacrificed Fredrika's love, Lili's love, and his own love for them—the friendship of any who attempted to interfere with his own modes of self-development; to this he would at any time have sacrificed, had he supposed it needful, the favor of the duke, and his position at court; to this, in fact, his life was one long offering. There was nothing Goethe would not have given up for others, except any iota of what he considered to be his own individuality. To tend that was his idolatry—and that this self-worship grew upon him at Weimar, no one can doubt."

Race.

Physical science is now proving more and more the immense importance of race; the importance of hereditary powers, hereditary organs, hereditary habits, in all organized beings, from the lowest plant to the highest animal. She is proving more and more the omnipresent action of the differences between races; how the more favored race (she cannot avoid using the epithet) exterminates the less favored, or at least expels it, and forces it, under penalty of death, to adapt itself to new circumstances; and, in a word, that competition between every race and every individ-

ual of that race, and reward according to deserts, is (as far as we can see) a universal law of living things. And she says—for the facts of history prove it—that, as it is among the races of plants and animals, so it has been unto this day among the races of men.

The natural theology of the future must take count of these tremendous and even painful facts; and she may take count of them. For Scripture has taken count of them already. It talks continually—it has been blamed for talking so much—of races, of families; of their wars, their struggles, their exterminations; of races favored, of races rejected; of remnants being saved, to continue the race; of hereditary tendencies, hereditary excellences, hereditary guilt. Its sense of the reality and importance of descent is so intense that it speaks of a whole tribe or a whole family by the name of its common ancestor, and the whole nation of the Jews is Israel, to the end. And if we be told this is true of the Old Testament, but not of the New, we must answer "What? Does not St. Paul hold the identity of the whole Jewish race with Israel, their forefather, as strongly as any prophet of the Old Testament? And what is the central historic fact, save one, of the New Testament, but the conquest of Jerusalem—the dispersion, all but destruction of a race, not by miracle, but by invasion, because found wanting when weighed in the stern balances of natural and social law?"

Greenland.

Lieutenant Payer, well known for his geological investigations in the Alps, has lately communicated some facts in regard to discoveries in Greenland by the late German expedition, of which he was a member; and in this he calls attention especially to the probability of the hypothesis that Greenland is essentially a congeries of islands similar to that west of it, and not a huge continental mass, as has been supposed by most authors. One strong evidence of this he considers to be furnished by the deep inlet discovered by the expedition, previously unrecorded on any chart, and which received the name of Emperor Francis Joseph's Fiord. This was found to extend deep into the interior of the land, continually opening into new arms, and widening in places until it was traced out for over one-third of the estimated breadth of Greenland, and without any indication of coming to an end. Indeed, in a southwesterly direction it opened out into what looked like a great basin, into which the fiord itself emptied. The circumstance also that the saltiness of the fiords is generally greatly diminished by the fresh-water streams pouring into them, when they are simply *cul-de-sacs*, and the fact that the great Greenland fiord, notwithstanding the enormous addition of fresh water, retained all its saltiness, pointed to a maritime communication with the opposite side of the country. Time was not allowed to the party to prosecute the exploration of this supposed strait; but it is believed, as stated, that it finds its opposite opening in Baffin's Bay. Another still more potent argument in favor of the assumption that Greenland is a congeries of islands, and not a continent, was found in the apparent absence of great longitudinal valleys, such as usually characterize continents, these being entirely wanting in the northeastern part of Greenland.

Prices paid for Celebrated Works.

Successful poets nowadays get what are called "fancy prices" for their productions. Mr. Tennyson can always command his price, even for an inferior article; and some people

are expressing their surprise that Mr. Browning should get one hundred pounds for his new poem, "Hervé Riel," which recently appeared in one of the magazines of the day. Some notes on the remuneration received by celebrated authors dead and gone may not be uninteresting. We all know what Milton got for his "Paradise Lost," namely, five pounds, with five pounds for the second edition, and eight pounds afterward. Dryden, for his famous "Ode on St.-Cecilia's Day," received two hundred and fifty guineas in all—a pretty fair comparison, we think, even with modern times; while Pope, for his poem bearing the same name, and intended, though unsuccessfully, to rival Dryden's masterpiece, got only fifteen pounds. Oliver Goldsmith, for his "Vicar of Wakefield," received sixty pounds. Gay, the author of the "Beggars' Opera," made one thousand pounds by his poems; while Lord Byron—perhaps the most successful poet that ever lived—made fifteen thousand pounds by his works. For his "Lay of the Last Minstrel" Sir Walter Scott received from Constable six hundred pounds, and for his "Marmion" ten hundred and fifty pounds. Thomas Campbell's "Pleasures of Hope" realized ten hundred and fifty pounds, and his "Gertrude of Wyoming" sixteen hundred guineas. Crabbe received for his poems three thousand pounds from Murray. The "Irish Melodies" gave Moore five hundred pounds a year. Certainly, in these latter days, really good poets have not had much reason to grumble; and perhaps, although the present is far from a poetical era, and our supply of first-rate poets is at the lowest ebb—passable poetry—even of the ordinary magazine sort—is better paid for than ever it was before.

A Light-fingered Teuton.

It is sad when German theologians take to stealing, for, besides being a bad example to the rest of the world, it will furnish a handle to those who have little faith in the efficacy of German theology. Not long since many books were missed from the Imperial Library at St. Petersburg, and one Aloys Pichler, a German theologian, was suspected of filching from the stores of literature therein accumulated. An attendant of the library very politely assisted the venerable scholar on with his overcoat one day, and took occasion to pass his hand over his back, where a concealed volume was distinctly felt. An official visit was afterward paid to the studious retreat of Herr Pichler, and there seven thousand volumes were discovered, all of which had been stolen from the library. This erudite but light-fingered Teuton is said to stand very high in the world of learning, and his selection of books indicated very sound taste and judgment.

Varieties.

A Maine paper reports a spiritual marriage, asserting that at a recent "circle" a young woman asked if the spirit of her dead lover was present, and, on being answered in the affirmative, and told, moreover, that he wished to marry her, had a justice of the peace called in, and the ceremony performed. The spiritual and spirited bride now claims the property of the dead man.

Michelet is represented as a white-haired man of seventy-six, with large, hollow eyes, a very intellectual face, a small, bent figure, full of dignity and grace. His conversation is serious and often sad, though now and then it rises into eloquence and brilliancy. His wife appears young enough to be his daughter, and is said to be a very pretty, though rather pensive-looking woman, of singularly sweet and winning manners.

Paris retained much of its gayety during even the worst hours of the siege. The *Gaulois* published, among other things, a restaurant advertisement, as follows:

"*Wine at ten sous the litre, et eau-dessus*"—(translatable either "and at higher rates," or "with water on it.")
 "*Rosée beef*"—(translatable either "roast beef," or "old horse beef.")
 "*Rat-gout de mouton*"—(translatable either "mutton ragout," or "rat with a mutton flavor.")

The Rothschilds are said to have lost from fifty to seventy-five million dollars by the result of the Franco-German War. They all believed at first that the French would be victorious; but, two weeks after the Germans had crossed the Rhine, they saw their mistake, and made new investments which prevented them from losing thrice as much as they would have done had they not corrected their blunder in good season.

James Glaisher, the English aeronaut, is said to be seriously ill, never having recovered from the effects of his balloon ascension from Wolverhampton, last September, when he reached a height of seven miles, the greatest ever attained. It is supposed he then burst some blood-vessels, as he has never since been in good health.

Mrs. Allibone, wife of the author of the "Dictionary of Authors," acted as her husband's amanuensis, and copied thirty thousand large foolscap pages for the press, besides doing a great deal of other work, as looking up and verifying dates, facts, etc. She must have been a helpmate of the old-fashioned sort.

The excellence of 'possum-fat and hominy as articles of food has long been celebrated by colored minstrels. It is now said that the flesh of the 'possum has medicinal virtues as well, it being a panacea for depression of spirits and low fevers, and the several ailments incident to age and decrepitude. Don't believe it. *Non possumus*.

The poor of London are becoming poorer. Year by year, owing to improvements in which the poor do not share, and to the progress of railroads from which they derive no benefit, the rents of the worst houses in London are rising, while the deterioration of those who are forced to occupy them is rapidly increasing.

The *Saturday Review* sneeringly says that, as American life grows respectable, it certainly grows dull; their best novelists have to deal with the disappearing phases of society—the backwoodsman, or the old Puritan settler, or the rough miner, who have all but given way to the commonplace gentleman in a white shirt and stovepipe hat.

Herr Wilhelm Türberg, who has been somewhat noted as a transcendental philosopher, has lately become a spiritual medium, and is reported to be making wonderful revelations at Mannheim. The whole city is represented to be lost in amazement over his miraculous powers.

The freehold of White's Club House, St. James Street, London, was recently sold for two hundred and thirty thousand dollars. White's was the oldest and most exclusive club in London, dating back to the time of Addison and Steele.

Boat-flying is the latest Southern amusement. Recently, a yawl-boat was carried across Cape Fear, off Wilmington, North Carolina, the motive power being a large kite, the string of which was held by two persons in the boat.

North Carolina has "an old man of the mountains," who lives about forty miles from Greenville, and has reached the age of one hundred and forty-three years. At the time of Braddock's defeat he was twenty years old, and had a wife and three children.

The total number of Scandinavians in the United States is estimated at four hundred thousand, of whom about fifty thousand are residents of Chicago. They number three hundred and eighty congregations, one hundred and forty ministers, and fifty thousand communicants.

A woman of Pisa, in Italy, Pipona Cetilli by name, has been condemned for the murder of her husband, and has confessed to the poisoning of her father, her two children, and her husband's mistress, all in the last six years. She is forty years old.

It is rumored that a marriage has been arranged between the Princess Beatrice, the fifth daughter and ninth child of Queen Victoria, and the Marquis of Ely. The princess is now in her fourteenth year. The marquis was born in 1849.

Vassar College has something new under the sun. Dr. T. W. DuBois has recently received the appointment of dentist to the above institution. He will look into all the young ladies' mouths once a week.

"Shall I help you to alight?" said a young gentleman, addressing a bouncing country-girl, who was preparing to jump from a carriage in front of his office. "Thank you, sir," sweetly replied the girl; "but I don't smoke."

Lecky, who wrote "The Rise and Fall of Rationalism" and several other books, is soon to become the husband of the Baroness van Dedem, lady-in-waiting to the Queen of Holland.

The new banking-house of Jay Cooke, McCulloch & Co., at the corner of Lombard and Grace Church street, London, is becoming the headquarters of American visitors in that city.

A London correspondent, writing of Mary Ann Evans (George Eliot), describes her as one of the most interesting and captivating of Englishwomen, entirely free from egotism or pretension of any kind.

A chap in Boston advertises for a "self-supporting" wife, "pretty and well educated." Modest, that!

A Pennsylvanian, after lighting a match, threw it into a powder-keg. The coroners of three counties are collecting the shreds.

An Eastern lady advertises for a laundress who will be willing to take her pay in lessons on the guitar.

Gustave Doré, though he has illustrated the Bible superbly, is declared to have no faith in it.

In London, workmen are carried on the railroads ten miles once a day each way for a week for twenty-five cents.

It was one of Douglas Jerrold's favorite sayings that "in the midst of life we are in debt."

There are seventy Swedenborgian churches in this country.

There are eight hundred thousand more women than men in England.

A bachelor compares a shirt-button to life, because it so often hangs by a thread.

"A backward spring" is produced by presenting a red-hot poker to a man's nose.

A drawing-room—Apartment of a dentist.

A firm friend—An obstinate Quaker.

Men of mark—Mark Twain and Bismarck.

The Museum.

IN No. 111 of the *JOURNAL* our Museum illustration depicted the war-dress of a Kaffre chief. We now give an illustration of the Kaffre soldier in his full war-uniform. It will be observed that it is more ornamental than useful, and quite as scant as it is showy. A gay and fantastic head-dress is its main feature. The varied and strange shapes that a Kaffre soldier can make with feathers, and fur, and raw-hide, are certainly remarkable. Any kind of feather is seized upon to do duty, but the most valued plumage is that of a roller, whose glittering dress of blue-green is worked up into large globular tufts, which are worn upon the back of the head and on the upper

part of the forehead. Such an ornament as this is seldom if ever seen upon the head of a simple warrior, as it is too valuable to be possessed by any but a chief of consideration. Panda is very fond of wearing this beautiful ornament on occasions of state, and sometimes wears two at once, the one on the front of his head - ring, and the other attached to the crown of the head.

The raw-hide is stripped of its fur by being rolled up and buried for a day or two, and is then cut and moulded into the most fantastic forms, reminding the observer of the strange

devices with which the heroes of the Niebelungen decorated their helmets. Indeed, some might easily be mistaken at a little distance

for the more classical though not more elaborate helmet of the ancient German knights. The soldiers which are here represented belong to two different regiments of the Zulu army, and have been selected as affording good examples of the wild, picturesque uniform which is adopted by these dusky troops. In some head-dresses fur is retained on the skin, and thus another effect is obtained. The object of all this savage decoration is twofold: first, to distinguish soldiers of the different regiments; and secondly, to strike terror into the enemy.

Kaffre Soldiers in War Uniform.

PATENT DAMPENING TABLETS,

For Copying Letters and Legal Documents.

R. HOE & CO.,
29 & 31 GOLD ST., NEW YORK.

STARR & MARCUS,

22 JOHN STREET, UP STAIRS.

OFFER AN
UNEQUALLED ASSORTMENT
OF THE

Gorham Mf'g Co. STERLING SILVER-WARE,

Comprising all their newest and most desirable patterns in Dinner, Tea, and Dessert Services, as well as Table Silver of endless variety. The experience of forty years, as Practical Silversmiths, has won for the goods of their manufacture a REPUTATION UNAPPROACHED BY ANY OTHER HOUSE.

The Gorham Factory possesses all the newest and most ingenious labor-saving machinery, employing hundreds of hands, skilled in designing, modelling, and finishing, thereby PRODUCING IN LARGE QUANTITIES, ON THE MOST ECONOMICAL BASIS, goods beautiful in design, and of unsurpassed finish, which are guaranteed of sterling purity by United States Mint Assay.

A complete assortment of Gorham Electroplate on Nickel Silver, at prices established by the Company.

RALPH THE HEIR.

By ANTHONY TROLLOPE.

[“RALPH THE HEIR,” SUPPLEMENT NO. XXIII.; CONTINUED FROM SUPPLEMENT ACCOMPANYING JOURNAL OF MAY 13.]

CHAPTER LV.

COOKHAM.

WE have been obliged to anticipate in some degree the course of our story by the necessity which weighed upon us of completing the history of Polly Neeft. In regard to her we will only further express an opinion—in which we believe that we shall have the concurrence of our readers—that Mr. Moggs junior had chosen well. Her story could not be adequately told without a revelation of that correspondence, which, while it has explained the friendly manner in which the Neeft-Newton embarrassments were at last brought to an end, has, at the same time, disclosed the future lot in life of our hero—as far as a hero's lot in life may be said to depend on his marriage.

Mr. Neeft had been almost heart-broken, because he was not satisfied that his victim was really punished by any of those tortures which his imagination invented, and his energy executed. Even when the “pretty little man” was smashed, and was, in truth, smashed of malice prepense by a swinging blow from Neeft's umbrella, Neeft did not feel satisfied that he would thereby reach his victim's heart. He could project his own mind with sufficient force into the bosom of his enemy to understand that the onions and tobacco consumed in that luxurious chamber would cause annoyance—but he desired more than annoyance—he wanted to tear the very heartstrings of the young man who had, as he thought, so signally outwitted him. He did not believe that he was successful; but, in truth, he did make poor Ralph very unhappy. The heir felt himself to be wounded, and could not eat and drink, or walk and talk, or ride in the park, or play billiards at his club, in a manner befitting the owner of Newton Priory. He was so injured by Neeft that he became pervious to attacks which would otherwise have altogether failed in reaching him. Lady Eardham would never have prevailed against him as she did—conquering by a quick repetition of small blows—had not all his strength been annihilated for the time by the persecutions of the breeches-maker.

Lady Eardham whispered to him as he was taking his departure on the evening of the dinner in Cavendish Square. “Dear Mr. Newton—just one word,” she said, confidentially—“that must be a very horrid man”—alluding to Mr. Neeft.

“It's a horrid bore, you know, Lady Eardham.”

“Just so—and it makes me feel—as though I didn't quite know whether something ought not to be done. Would you mind calling at eleven to-morrow? Of course I sha'n't tell Sir George—unless you think he ought to be told.” Ralph promised that he would call, though he felt at the moment that Lady Eardham was an interfering old fool. Why should she want to do any thing; and why should she give even a hint as to telling Sir George? As he walked across Hanover Square and down Bond Street to his rooms he did assert to himself plainly that the “old harridan,” as he called her, was at work for her second girl, and he shook his head and winked his eye as he thought of it. But, even in his solitude, he did not feel strong against Lady Eardham, and he moved along the pavement oppressed by a half-formed conviction that her ladyship would prevail against him. He did not, however, think that he had any particular objection to Gus Eardham. There was a deal of style about the girl, a merit in which either Clarissa or Mary would have been sadly deficient. And there could be no doubt in this—that a man in his position ought to marry in his own class. The proper thing for him to do was to make the daughter of some country gentleman—or of some nobleman, just as it might happen—mistress of the Priory. Dear little Clary would hardly have known how to take her place properly down in Hampshire. And then he thought for a moment of Polly! Perhaps, after all, fate, fashion, and fortune, managed marriage for young men better than they could manage it for themselves. What a life would his have been had he really married Polly Neeft! Though he did call Lady Eardham a harridan, he resolved that he would keep his promise for the following morning.

Lady Eardham when he arrived was mysterious, eulogistic, and beneficent. She was clearly of opinion that something should be done. “You know it is so horrid having these kind of things said.” And yet she was almost equally strong in opinion that nothing could be done. “You know I wouldn't have my girl's name brought up for all the world—though why the horrid wretch should have named her I cannot even guess.” The horrid wretch had not, in truth, named any special her, though it suited Lady Eardham to presume that allusion had been made to that hope of the flock, that crowning glory of the Eardham family, that most graceful of the Graces, that Venus certain to be chosen by any Paris, her second daughter, Gus. She went on to explain that were she to tell the

story to her son Marmaduke, her son Marmaduke “would probably kill the breeches-maker.” As Marmaduke Eardham was, of all young men about town, perhaps the most careless, the most indifferent, and the least ferocious, his mother was probably mistaken in her estimate of his resentful feelings. “As for Sir George, he would be for taking the law of the wretch for libel, and then we should be—! I don't know where we should be then; but my dear girl would die.”

Of course there was nothing done. During the whole interview Lady Eardham continued to press Neeft's letter under her hand upon the table, as though it was of all documents the most precious. She handled it as though to tear it would be as bad as to tear an original document bearing the king's signature. Before the interview was over she had locked it up in her desk, as though there were something in it by which the whole Eardham race might be blessed or banned. And, though she spoke no such word, she certainly gave Ralph to understand that by this letter he, Ralph Newton, was in some mysterious manner so connected with the secrets, and the interests, and the sanctity of the Eardham family, that, whether such connection might be for weal or woe, the Newtons and the Eardhams could never altogether free themselves from the link. “Perhaps you had better come and dine with us in a family way to-morrow,” said Lady Eardham, giving her invitation as though it must necessarily be tendered, and almost necessarily accepted. Ralph, not thanking her, but taking it in the same spirit, said that he would be there at half-past seven. “Just ourselves,” said Lady Eardham, in a melancholy tone, as though they two were doomed to eat family dinners together for ever after.

“I suppose the property is really his own,” said Lady Eardham to her husband that afternoon.

Sir George was a stout, plethoric gentleman, with a short temper and many troubles. Marmaduke was expensive, and Sir George himself had spent money when he was young. The girls, who knew that they had no fortunes, expected that every thing should be done for them, at least during the period of their natural harvest—and they were successful in having their expectations realized. They demanded that there should be horses to ride, servants to attend them, and dresses to wear; and they had horses, servants, and dresses. There were also younger children; and Sir George was quite as anxious as Lady Eardham that his daughters should become

wives. "His own—of course it's his own. Whom else should it belong to?"

"There was something about that other young man."

"The bastard! It was the greatest sin that ever was thought of to palm such a fellow as that off on the country—but it didn't come to any thing."

"I'm told, too, he has been very extravagant. No doubt he did get money from the—tailor who wants to make him marry his daughter."

"A flea-bite," said Sir George. "Don't you bother about that." Thus authorized, Lady Eardham went to the work with a clear conscience and a good will.

On the next morning Ralph received by post an envelope from Sir Thomas Underwood containing a letter addressed to him from Mr. Neeft. "Sir—Are you going to make your ward act honorable to me and my daughter? Yours, respectful, THOMAS NEEFIT." The reader will understand that this was prior to Polly's triumph over her father. Ralph uttered a deep curse, and made up his mind that he must either throw himself entirely among the Eardhams, or else start at once for the Rocky Mountains. He dined in Cavendish Square that day, and again took Gus down to dinner.

"I'm very glad to see you here," said Sir George, when they two were alone together after the ladies had left them. Sir George, who had been pressed upon home service because of the necessity of the occasion, was anxious to get off to his club.

"You are very kind, Sir George," said Ralph.

"We shall be delighted to see you at Brayboro', if you'll come for a week in September and look at the girls' horses. They say you're quite a pundit about horse flesh."

"Oh, I don't know," said Ralph.

"You'll like to go up to the girls now, I dare say, and I've got an engagement." Then Sir George rang the bell for a cab, and Ralph went up-stairs to the girls. Emily had taken herself away; Josephine was playing *bésique* with her mother, and Gus was thus forced into conversation with the young man. "*Bésique* is so stupid," said Gus.

"Horribly stupid," said Ralph.

"And what do you like, Mr. Newton?"

"I like you," said Ralph. But he did not propose on that evening. Lady Eardham thought he ought to have done so, and was angry with him. It was becoming almost a matter of necessity with her that young men should not take much time. Emily was twenty-seven, and Josephine was a most difficult child to manage—not pretty, but yet giving herself airs and expecting every thing. She had refused a clergyman with a very good private fortune, greatly to her mother's sorrow. And Gus had already been the source of much weary labor. Four eldest sons had been brought to her feet and been allowed to slip away; and all, as Lady Eardham said, because Gus would "joke" with other young men, while the one man should have received all her plensantry. Emily was quite of opin-

ion that young Newton should by no means have been allotted to Gus. Lady Eardham, who had played *bésique* with an energy against which Josephine would have muttered but that some promise was made as to Marshall and Snelgrove, could see from her little table that young Newton was neither abject nor triumphant in his manner. He had not received nor had he even asked when he got up to take his leave. Lady Eardham could have boxed his ears; but she smiled upon him ineffably, pressed his hand, and in the most natural way in the world alluded to some former allusion about riding and the park.

"I sha'n't ride to-morrow," said Gus, with her back turned to them.

"Do," said Ralph.

"No. I sha'n't."

"You see what she says, Lady Eardham," said Ralph.

"You promised you would before dinner, my dear," said Lady Eardham, "and you ought not to change your mind. If you'll be good-natured enough to come, two of them will go." Of course it was understood that he would come.

"Nothing on earth, mamma, shall ever induce me to play *bésique* again," said Josephine, yawning.

"It's not worse for you than for me," said the old lady, sharply.

"But it isn't fair," said Josephine, who was supposed to be the clever one of the family. "I may have to play my *bésique* a quarter of a century hence."

"He's an insufferable puppy," said Emily, who had come into the room, and had been pretending to be reading.

"That's because he don't bark at your bidding, my dear," said Gus.

"It doesn't seem that he means to bark at yours," said the elder sister.

"If you go on like that, girls, I'll tell your papa, and we'll go to Brayboro' at once. It's too bad, and I won't bear it."

"What would you have me do?" said Gus, standing up for herself fiercely.

Gus did ride, and so did Josephine, and there was a servant with them of course. It had been Emily's turn—there being two horses for the three girls; but Gus had declared that no good could come if Emily went—and Emily's going had been stopped by parental authority. "You do as you're bid," said Sir George, "or you'll get the worst of it." Sir George suffered much from gout, and had obtained from the ill-temper which his pangs produced a mastery over his daughters which some fathers might have envied.

"You behaved badly to me last night, Mr. Newton," said Gus, on horseback. There was another young man riding with Josephine, so that the lovers were alone together.

"Behaved badly to you?"

"Yes, you did, and I felt it very much—very much indeed."

"How did I behave badly?"

"If you do not know, I'm sure that I shall not tell you." Ralph did not know—but he went home from his ride an unengaged man,

and may perhaps have been thought to behave badly on that occasion also.

But Lady Eardham, though she was sometimes despondent and often cross, was gifted with perseverance. A picnic party up the river from Maidenhead to Cookham was got up for the 30th of May, and Ralph Newton of course was there. Just at that time the Neeft persecution was at its worst. Letters directed by various hands came to him daily, and in all of them he was asked when he meant to be on the square. He knew the meaning of that picnic as well as does the reader—as well as did Lady Eardham; but it had come to that with him that he was willing to yield. It cannot exactly be said for him that out of all the feminine worth that he had seen, he himself had chosen Gus Eardham as being the most worthy—or even that he had chosen her as being to him the most charming. But it was evident to him that he must get married, and why not to her as well as to another? She had style, plenty of style; and, as he told himself, style, for a man in his position, was more than any thing else. It can hardly be said that he had made up his mind to offer to her before he started for Cookham—though doubtless through all the remaining years of his life he would think that his mind had been so fixed—but he had concluded that, if she were thrown at his head very hard, he might as well take her. "I don't think he ever does drink champagne," said Lady Eardham, talking it all over with Gus on the morning of the picnic.

At Cookham there is, or was, a punt—perhaps there always will be one, kept there for such purposes—and into this punt either Gus was tempted by Ralph, or Ralph by Gus. "My darling child, what are you doing?" shouted Lady Eardham from the bank.

"Mr. Newton says he can take me over," said Gus, standing up in the punt, shaking herself with a pretty tremor.

"Don't, Mr. Newton; pray don't," cried Lady Eardham, with affected horror.

Lunch was over, or dinner, as it might be more properly called, and Ralph had taken a glass or two of champagne. He was a man whom no one had ever seen the "worse for wine;" but on this occasion that which might have made others drunk had made him bold. "I will not let you out, Gus, till you have promised me one thing," said Ralph.

"What is the one thing?"

"That you will go with me everywhere, always."

"You must let me out," said Gus.

"But will you promise?" Then Gus promised; and Lady Eardham, with true triumph in her voice, was able to tell her husband on the following morning that the cost of the picnic had not been thrown away.

On the next morning early Ralph was in the square. Neither when he went to bed at night, nor when he got up in the morning, did he regret what he had done. The marriage would be quite a proper marriage. Nobody could say that he had been mercenary, and he hated a mercenary feeling in marriages. Nobody could say that the match was beneath

him, and all people were agreed that Augusta Eardham was a very fine girl. As to her style, there could be no doubt about it. There might be some little unpleasantness in communicating the fact to the Underwoods—but that could be done by letter. After all, it would signify very little to him what Sir Thomas thought about it. Sir Thomas might think him feeble; but he himself knew very well that there had been no feebleness in it. His circumstances had been very peculiar, and he really believed that he had made the best of them. As Squire of Newton, he was doing quite the proper thing in marrying the daughter of a baronet out of the next county. With a light heart, a pleased face, and with very well got-up morning apparel, Ralph knocked the next morning at the door in Cavendish Square, and asked for Sir George Eardham. "I'll just run up-stairs for a second," said Ralph, when he was told that Sir George was in the small parlor.

He did run up-stairs, and in three minutes had been kissed by Lady Eardham and all her daughters. At this moment Gus was the "dearest child" and the "best love of a thing" with all of them. Even Emily remembered how pleasant it might be to have a room at Newton Priory, and then success always gives a new charm.

"Have you seen Sir George?" asked Lady Eardham.

"Not as yet—they said he was there, but I had to come up and see her first, you know."

"Go down to him," said Lady Eardham, patting her prey on the back twice. "When you've daughters of your own, you'll expect to be consulted."

"She couldn't have done better, my dear fellow," said Sir George, with kind, genial cordiality. "She couldn't have done better, to my thinking, even with a peerage. I like you, and I like your family, and I like your property; and she's yours with all my heart. A better girl never lived."

"Thank you, Sir George."

"She has no money, you know."

"I don't care about money, Sir George."

"My dear boy, she's yours with all my heart; and I hope you'll make each other happy."

CHAPTER LVI.

RALPH NEWTON IS BOWLED AWAY.

A DAY or two after his engagement, Ralph did write his letter to Sir Thomas, and found when the moment came that the task was difficult. But he wrote it. The thing had to be done, and there was nothing to be gained by postponing it.

"— Club, June 2, 186—.

"MY DEAR SIR THOMAS:

"You will, I hope, be glad to hear that I am engaged to be married to Augusta Eardham, the second daughter of Sir George Eardham, of Brayboro' Park, in Berkshire. Of course you will know the name, and I rather think you were in the House when Sir George sat for Berkshire. Augusta has got no

money, but I have not been placed under the disagreeable necessity of looking out for a rich wife. I believe we shall be married about the end of August. As the ceremony will take place down at Brayboro', I fear that I cannot expect that you or Patience and Clarissa should come so far. Pray tell them my news, with my best love.

"Yours, most grateful for all your long kindness,

"RALPH NEWTON.

"I am very sorry that you should have been troubled by letters from Mr. Neefit. The matter has been arranged at last."

The letter when done was very simple, but it took him some time, and much consideration. Should he or should he not allude to his former loves? It was certainly much easier to write his letter without any such allusion, and he did so.

About a week after this Sir Thomas went home to Fulham, and took the letter with him. "Clary," he said, taking his youngest daughter affectionately by the waist, when he found himself alone with her. "I've got a piece of news for you."

"For me, papa?"

"Well, for all of us. Somebody is going to be married. Who do you think it is?"

"Not Ralph Newton?" said Clarissa, with a little start.

"Yes, Ralph Newton."

"How quick he arranges things!" said Clarissa. There was some little emotion, just a quiver, and a quick rush of blood into her cheeks, which, however, left them just as quickly.

"Yes—he is quick."

"Who is it, papa?"

"A very proper sort of person—the daughter of a Berkshire baronet."

"But what is her name?"

"Augusta Eardham."

"Augusta Eardham. I hope he'll be happy, papa. We've known him a long time."

"I think he will be happy—what people call happy. He is not gifted—or cursed, as it may be—with fine feelings, and is what perhaps may be called thick-skinned; but he will love his own wife and children. I don't think he will be a spendthrift now that he has plenty to spend, and he is not subject to what the world calls vices. I shouldn't wonder if he becomes a prosperous and most respectable country gentleman, and quite a model to his neighbors."

"It doesn't seem to matter much—does it?" said Clarissa, when she told the story to Mary and Patience.

"What doesn't matter?" asked Mary.

"Whether a man cares for the girl he's going to marry, or doesn't care at all. Ralph Newton cannot care very much for Miss Eardham."

"I think it matters very much," said Mary.

"Perhaps, after all, he'll be just as fond of his wife—in a way, as though he had been making love to her—oh, for years," said Clarissa. This was nearly all that was said at the villa, though, no doubt, poor Clary had

many thoughts on the matter, in her solitary rambles along the river. That picture of the youth, as he lay upon the lawn, looking up into her eyes, and telling her that she was dear to him, could not easily be effaced from her memory. Sir Thomas before this had written his congratulations to Ralph. They had been very short, and in them no allusion had been made to the young ladies at Popham Villa.

In the mean time Ralph was as happy as the day was long, and delighted with his lot in life. For some weeks previous to his offer he had been aware that Lady Eardham had been angling for him as for a fish, that he had been as a prey to her and to her daughter, and that it behooved him to amuse himself without really taking the hook between his gills. He had taken the hook, and now had totally forgotten all those former notions of his in regard to a prey, and a fish, and a mercenary old harridan of a mother. He had no sooner been kissed all round by the women, and paternally blessed by Sir George, than he thought that he had exercised a sound judgment, and had with true wisdom arranged to ally himself with just the woman most fit to be his wife, and the future mistress of Newton Priory. He was proud, indeed, of his success, when he read the paragraph in the *Morning Post*, announcing as a fact that the alliance had been arranged, and was again able to walk about among his comrades as one of those who make circumstances subject to them, rather than become subject to circumstances. His comrades, no doubt, saw the matter in another light. "By Jove," said Pretty Poll at his club, "there's Newton been and got caught by old Eardham after all. The girl has been running ten years, and been hawked about like a second-class race-horse."

"Yes, poor fellow," said Captain Fooks. "Neefit has done that for him. Ralph for a while was so knocked off his pins by the breeches-maker, that he didn't know where to look for shelter."

Whether marriages should be made in heaven or on earth, must be a matter of doubt to observers—whether, that is, men and women are best married by chance, which I take to be the real fashion of heaven-made marriages; or should be brought into that close link and loving bondage to each other by thought, selection, and decision. That the heavenly mode prevails the oftener there can hardly be a doubt. It takes years to make a friendship; but a marriage may be settled in a week—in an hour. If you desire to go into partnership with a man in business, it is an essential necessity that you should know your partner; that he be honest—or dishonest, if such be your own tendency—industrious, instructed in the skill required, and of habits of life fit for the work to be done. But into partnerships for life—of a kind much closer than any business partnership—men rush without any preliminary inquiries. Some investigation and anxiety as to means there may be, though in this respect the ordinary parlance of the world endows men with more caution, or accuses them of more greed than

they really possess. But in other respects every thing is taken for granted. Let the woman, if possible, be pretty—or, if not pretty, let her have style. Let the man, if possible, not be a fool; or, if a fool, let him not show his folly too plainly. As for knowledge of character, none is possessed, and none is wanted. The young people meet each other in their holiday dresses, on holiday occasions, amid holiday pleasures—and the thing is arranged. Such matches may be said to be heaven-made.

It is a fair question whether they do not answer better than those which have less of chance—or less of heaven—in their manufacture. If it be needful that a man and woman take five years to learn whether they will suit each other as husband and wife, and that then, at the end of the five years, they find that they will not suit, the freshness of the flower would be gone before it could be worn in the button-hole. There are some leaps which you must take in the dark, if you mean to jump at all. We can all understand well that a wise man should stand on the brink and hesitate; but we can understand also that a very wise man should declare to himself that with no possible amount of hesitation could certainty be achieved. Let him take the jump or not take it—but let him not presume to think that he can so jump as to land himself in certain bliss. It is clearly God's intention that men and women should live together, and therefore let the leap in the dark be made.

No doubt there had been very much of heaven in Ralph Newton's last choice. It may be acknowledged that in lieu of choosing at all, he had left the matter altogether to Heaven. Some attempt he had made at choosing—in reference to Mary Bonner; but he had found the attempt simply to be troublesome and futile. He had spoken soft, loving words to Clarissa, because she herself had been soft and lovable. Nature had spoken—as she does when the birds sing to each other. Then, again, while suffering under pecuniary distress he had endeavored to make himself believe that Polly Neeft was just the wife for him. Then, amid the glories of his emancipation from thralldom, he had seen Mary Bonner—and had actually, after a fashion, made a choice for himself. His choice had brought upon him nothing but disgrace and trouble. Now he had succumbed at the bidding of Heaven and Lady Eardham, and he was about to be provided with a wife exactly suited for him. It may be said at the same time that Augusta Eardham was equally lucky. She also had gotten all that she ought to have wanted, had she known what to want. They were both of them incapable of what men and women call love when they speak of love as a passion linked with romance. And in one sense they were cold-hearted. Neither of them was endowed with the privilege of pining because another person had perished. But each of them was able to love a mate, when assured that that mate must continue to be mate, unless separation should come by domestic earthquake. They had hearts enough for paternal and maternal duties, and would probably agree

in thinking that any geese which Providence might send them were veritable swans. Bickerings there might be, but they would be bickerings without effect; and Ralph Newton, of Newton, would probably so live with this wife of his bosom, that they, too, might lie at last pleasantly together in the family vault, with the record of their homely virtues visible to the survivors of the parish on the same tombstone. The means by which each of them would have arrived at these blessings would not redound to the credit of either; but the blessings would be there, and it may be said of their marriage, as of many such marriages, that it was made in heaven, and was heavenly.

The marriage was to take place early in September, and the first week in August was passed by Sir George and Lady Eardham and their two younger daughters at Newton Priory. On the 14th Ralph was to be allowed to run down to the moors just for one week, and then he was to be back, passing between Newton and Brayboro', signing deeds and settlements, preparing for their wedding tour, and obedient in all things to Eardham influences. It did occur to him that it would be proper that he should go down to Fulham to see his old friends once before his marriage; but he felt that such a visit would be to himself very unpleasant, and therefore he assured himself, and moreover made himself believe that, if he abstained from the visit, he would abstain because it would be unpleasant to him. He did abstain. But he did call at the chambers in Southampton Buildings; he called, however, at an hour in which he knew that Sir Thomas would not be visible, and made no second pressing request to Stemm for the privilege of entrance.

He had great pride in showing his house and park and estate to the Eardhams, and had some delicious rambles with his Augusta through the shrubberies and down by the little brook. Ralph had an enjoyment in the prettiness of Nature, and Augusta was clever enough to simulate the feeling. He was a little annoyed, perhaps, when he found that the beauty of her morning dresses did not admit of her sitting upon the grass or leaning against gates, and once expressed an opinion that she need not be so particular about her gloves in this the hour of their billing and cooling. Augusta altogether declined to remove her gloves in a place swarming, as she said, with midges, or to undergo any kind of embrace while adorned with that sweetest of all hats, which had been purchased for his especial delight. But in other respects she was good humored, and tried to please him. She learned the names of all his horses, and was beginning to remember those of his tenants. She smiled upon Gregory, and behaved with a pretty decorum when the young parson showed her his church. Altogether her behavior was much better than might have been expected from the training to which she had been subjected during her seven seasons in London. Lord Polperrow wronged her greatly when he said that she had been "running" for ten years.

There was a little embarrassment in

Ralph's first interview with Gregory. He had given his brother notice of his engagement by letter as soon as he had been accepted, feeling that any annoyance coming to him might be lessened in that way. Unfortunately, he had spoken to his brother in what he now felt to have been exaggerated terms of his passion for Mary Bonner, and he himself was aware that that malady had been quickly cured. "I suppose the news startled you," he had said, with a forced laugh, as soon as he met his brother.

"Well—yes, a little. I did not know that you were so intimate with them."

"The truth is, I had thought a deal about the matter, and I had come to see how essential it was for the interests of us all that I should marry into our own set. The moment I saw Augusta I felt that she was exactly the girl to make me happy. She is very handsome. Don't you think so?"

"Certainly."

"And then she has just the style which, after all, does go so far. There's nothing dowdy about her. A dowdy woman would have killed me. She attracted me from the first moment; and, by Jove, old fellow, I can assure you it was mutual. I am the happiest fellow alive, and I don't think there is any thing I envy anybody." In all this Ralph believed that he was speaking the simple truth.

"I hope you'll be happy, with all my heart," said Gregory.

"I am sure I shall—and so will you if you will ask that little puss once again. I believe in my heart she loves you." Gregory, though he had been informed of his brother's passion for Mary, had never been told of that other passion for Clarissa; and Ralph could therefore speak of ground for hope in that direction without uncomfortable twinges.

There did occur during this fortnight one or two little matters, just sufficiently laden with care to ruffle the rose-leaves of our hero's couch. Lady Eardham thought that both the dining-room and drawing-room should be refurnished, that a bow-window should be thrown out to the breakfast-parlor, and that a raised conservatory should be constructed into which Augusta's own morning sitting-room up-stairs might be made to open. Ralph gave way about the furniture with a good grace, but he thought that the bow-window would disfigure the house, and suggested that the raised conservatory would cost money. Augusta thought the bow-window was the very thing for the house, and Lady Eardham knew as a fact that a similar conservatory—the sweetest thing in the world—which she had seen at Lord Rosebud's had cost almost absolutely nothing. And if any thing was well known in gardening it was this, that the erection of such conservatories was a positive saving in garden expenses. The men worked under cover during the rainy days, and the hot water served for domestic as well as horticultural purposes. There was some debate and a little heat, and the matter was at last referred to Sir George. He voted against Ralph on both points, and the orders were given.

Then there was the more important question of the settlements. Of course there were to be settlements, in the arrangement of which Ralph was to give every thing and to get nothing. With high-handed magnanimity he had declared that he wanted no money, and therefore the trifle which would have been adjudged to be due to Gus was retained to help her as yet less fortunate sisters. In truth, Marmaduke at this time was so expensive that Sir George was obliged to be a little hard. Why, however, he should have demanded out of such a property as that of Newton a jointure of four thousand pounds a year, with a house to be found either in town or country as the widow might desire, on behalf of a penniless girl, no one acting in the Newton interest could understand, unless Sir George might have thought that the sum to be ultimately obtained might depend in some degree on that demanded. Had he known Mr. Carey he would probably not have subjected himself to the rebuke which he received.

Ralph, when the sum was first named to him by Sir George's lawyer, who came down purposely to Newton, looked very blank, and said that he had not anticipated any arrangement so destructive to the property. The lawyer pointed out that there was unfortunately no dowager's house provided; that the property would not be destroyed, as the dower would only be an annuity; that ladies now were more liberally treated in this matter than formerly—and that the suggestion was quite the usual thing. "You don't suppose I mean my daughter to be starved?" said Sir George, upon whom gout was then coming. Ralph plucked up spirit and answered him. "Nor do I intend that your daughter, sir, should be starved." "Dear Ralph, do be liberal to the dear girl," said Lady Eardham afterward, caressing our hero in the solitude of her bedroom. Mr. Carey, however, arranged the whole matter very quickly. The dower must be two thousand pounds, out of which the widow must find her own house. Sir George must be well aware, said Mr. Carey, that the demand made was preposterous. Sir George said one or two very nasty things; but the dower as fixed by Mr. Carey was accepted, and then every thing smiled again.

When the Eardhams were leaving Newton the parting between Augusta and her lover was quite pretty. "Dear Gus," he said, "when next I am here, you will be my own, own wife," and he kissed her. "Dear Ralph," she said, "when next I am here, you will be my own, own husband," and kissed him; "but we have Como, and Florence, and Rome, and Naples, to do before that—and won't that be nice?"

"It will be very nice to be anywhere with you," said the lover.

"And mind you have your coat made just as I told you," said Augusta. So they parted.

Early in September they were married with great *éclat* at Brayboro', and Lady Eardham spared nothing on the occasion. It was her first maternal triumph, and all the country round was made to know of her success. The Newtons had been at Newton for—she

did not know how many hundred years. In her zeal she declared that the estate had been in the same hands from long before the Conquest. "There's no title," she said to her intimate friend, Lady Wiggam, "but there's that which is better than a title. We're mushrooms to the Newtons, you know. We only came into Berkshire in the reign of Henry VIII." As the Wiggams had only come into Buckinghamshire in the reign of George IV., Lady Wiggam, had she known the facts, would probably have reminded her dear friend that the Eardhams had in truth first been heard of in those parts in the time of Queen Anne—the original Eardham having made his money in following Marlborough's army. But Lady Wiggam had not studied the history of the county gentry. The wedding went off very well, and the bride and bridegroom were bowled away to the nearest station with four gray post-horses from Reading in a manner that was truly delightful to Lady Eardham's motherly feelings.

And with the same gray horses shall the happy bride and bridegroom be bowled out of our sight also. The writer of this story feels that some apology is due to his readers for having endeavored to entertain them so long with the adventures of one of whom it certainly cannot be said that he was fit to be delineated as a hero. It is thought by many critics that in the pictures of imaginary life which novelists produce for the amusement, and possibly for the instruction of their readers, none should be put upon the canvas but the very good, who by their noble thoughts and deeds may lead others to nobility, or the very bad, who by their declared wickedness will make iniquity hideous. How can it be worth one's while, such critics will say—the writer here speaks of all critical readers, and not of professional critics—how can it be worth our while to waste our imaginations, our sympathies, and our time upon such a one as Ralph, the heir of the Newton property? The writer, acknowledging the force of these objections, and confessing that his young heroes of romance are but seldom heroic, makes his apology as follows:

The reader of a novel—who has doubtless taken the volume up simply for amusement, and who would probably lay it down did he suspect that instruction, like a snake-in-the-grass, like physic beneath the sugar, was to be imposed upon him—requires from his author chiefly this, that he shall be amused by a narrative in which elevated sentiment prevails, and gratified by being made to feel that the elevated sentiments described are exactly his own. When the heroine is nobly true to her lover, to her friend, or to her duty, through all persecution, the girl who reads declares to herself that she also would have been a Jeannie Deans had Fate and Fortune given her an Effie as a sister. The bald-headed old lawyer—for bald-headed old lawyers do read novels—who interests himself in the high-minded, self-devoting chivalry of a Colonel Newcombe, believes he would have acted as did the colonel had he been so tried. What youth in his imagination cannot be as

brave, and as loving, though as hopeless in his love, as Harry Esmond? Alas, no one will wish to be as was Ralph Newton! But for one Harry Esmond, there are fifty Ralph Newtons—five hundred and fifty of them; and the very youth whose bosom glows with admiration as he reads of Harry—who exults in the idea that as Harry did, so would he have done—lives as Ralph lived, is less noble, less persistent, less of a man even than was Ralph Newton.

It is the test of a novel-writer's art that he conceals his snake-in-the-grass; but the reader may be sure that it is always there. No man or woman with a conscience—no man or woman with intellect sufficient to produce amusement, can go on from year to year spinning stories without the desire of teaching; with no ambition of influencing readers for their good. Gentle readers, the physic is always beneath the sugar, hidden or unhidden. In writing novels, we novelists preach to you from our pulpits, and are keenly anxious that our sermons shall not be inefficacious. Inefficacious they are not, unless they be too badly preached to obtain attention. Injurious they will be unless the lessons taught be good lessons.

What a world this would be if every man were a Harry Esmond, or every woman a Jeannie Deans! But then again, what a world if every woman were a Beckie Sharp and every man a Varney or a Barry Lyndon! Of Varneys and Harry Esmonds there are very few. Human nature, such as it is, does not often produce them. The portraits of such virtues and such vices serve no doubt to emulate and to deter. But are no other portraits necessary? Should we not be taught to see the men and women among whom we really live—men and women such as we are ourselves—in order that we should know what are the exact failings which oppress ourselves, and thus learn to hate, and if possible to avoid in life the faults of character which in life are hardly visible, but which in portraiture of life can be made to be so transparent?

Ralph Newton did nothing, gentle reader, which would have caused thee greatly to grieve for him, nothing certainly which would have caused thee to repudiate him, had he been thy brother. And gentlest, sweetest reader, had he come to thee as thy lover, with sufficient protest of love, and with all his history written in his hand, would that have caused thee to reject his suit? Had he been thy neighbor, thou well-to-do reader, with a house in the country, would he not have been welcome to thy table? Wouldst thou have avoided him at his club, thou reader from the West End? Has he not settled himself respectably, thou gray-haired, novel-reading paterfamilias, thou materfamilias, with daughters of thine own to be married? In life would he have been held to have disgraced himself—except in the very moment in which he seemed to be in danger? Nevertheless, the faults of a Ralph Newton, and not the vices of a Varney or a Barry Lyndon, are the evils against which men should in these days be taught to guard themselves—which wom-

en also should be made to hate. Such is the writer's apology for his very indifferent hero, Ralph the Heir.

CHAPTER LVII.

CLARISSA'S FATE.

In the following October, while Newton of Newton and his bride were making themselves happy amid the glories of Florence, she with her finery from Paris, and he with a newly-acquired taste for Michael Angelo and the fine arts generally, Gregory the parson again went up to London. He had, of course, "assisted" at his brother's marriage—in which the heavy burden of the ceremony was imposed on the shoulders of a venerable dean, who was related to Lady Eardham—and had since that time been all alone at his parsonage. Occasionally he had heard of the Underwoods from Ralph Newton of Beamingham, whose wedding had been postponed till Beamingham Hall had been made fit for its mistress; and from what he had heard Gregory was induced—hardly to hope—but to dream it to be possible that even yet he might prevail in love. An idea had grown upon him, springing from various sources, that Clarissa had not been indifferent to his brother, and that this feeling on her part had marred, and must continue to mar, his own happiness. He never believed that there had been fault on his brother's part; but still, if Clarissa had been so wounded—he could hardly hope—and perhaps should not even wish—that she would consent to share with him his parsonage in the close neighborhood of his brother's house. During all that September he told himself that the thing should be over, and he began to teach himself—to try to teach himself—that celibacy was the state in which a clergyman might best live and do his duty. But the lesson had not gone far with him before he shook himself, and determined that he would try yet once again. If there had been such a wound, why should not the wound be cured? Clarissa was at any rate true. She would not falsely promise him a heart, when it was beyond her power to give it. In October, therefore, he went again up to London.

The cases for packing the books had not even yet been made, and Sir Thomas was found in Southampton Buildings. The first words had, of course, reference to the absent squire. The squire of one's parish, the head of one's family, and one's elder brother, when the three are united in the same personage, will become important to one, even though the personage himself be not heroic. Ralph had written home twice, and every thing was prospering with him. Sir Thomas, who had become tired of his late ward, and who had thought worse of the Eardham marriage than the thing deserved, was indifferent to the joys of the Italian honeymoon. "They'll do very well, no doubt," said Sir Thomas. "I was delighted to learn that Augusta bore her journey so well," said Gregory. "Augustas al-

ways do bear their journeys well," said Sir Thomas; "though sometimes, I fancy, they find the days a little too long."

But his tone was very different when Gregory asked his leave to make one more attempt at Popham Villa. "I only hope you may succeed—for her sake, as well as for your own," said Sir Thomas. But when he was asked as to the parson's chance of success, he declared that he could say nothing. "She is changed, I think, from what she used to be—is more thoughtful, perhaps, and less giddy. It may be that such change will turn her toward you." "I would not have her changed in any thing," said Gregory—"except in her feelings toward myself."

He had been there twice or thrice before he found what he thought to be an opportunity fit for the work that he had on hand. And yet both Patience and Mary did for him and for her all that they knew how to do. But in such a matter it is so hard to act without seeming to act! She who can manœuvre on such a field without displaying her manœuvres is indeed a general! No man need ever attempt the execution of a task so delicate. Mary and Patience put their heads together, and resolved that they would say nothing. Nor did they manifestly take steps to leave the two alone together. It was a question with them, especially with Patience, whether the lover had not come too soon.

But Clarissa at last attacked her sister. "Patience," she said, "why do you not speak to me?"

"Not speak to you, Clary?"

"Not a word—about that which is always on my mind. You have not mentioned Ralph Newton's name once since his marriage."

"I have thought it better not to mention it. Why should I mention it?"

"If you think that it would pain me, you are mistaken. It pains me more that you should think that I could not bear it. He was welcome to his wife."

"I know you wish him well, Clary."

"Well! Oh, yes, I wish him well. No doubt he will be happy with her. She is fit for him, and I was not. He did quite right."

"He is not half so good as his brother," said Patience.

"Certainly he is not so good as his brother. Men, of course, will be different. But it is not always the best man that one likes the best. It ought to be so, perhaps."

"I know which I like the best," said Patience. "Oh, Clary, if you could but bring yourself to love him."

"How is one to change like that? And I do not know that he cares for me now."

"Ah—I think he cares for you."

"Why should he? Is a man to be sacrificed for always because a girl will not take him? His heart is changed. He takes care to show me so when he comes here. I am glad that it should be changed. Dear Patty, if papa would but come and live at home, I should want nothing else."

"I want something else," said Patience.

"I want nothing but that you should love me—and that papa should be with us. But,

Patty, do not make me feel that you are afraid to speak to me."

On the day following Gregory was again at Fulham, and he had come thither fully determined that he would now for the last time ask that question, on the answer to which, as it now seemed to him, all his future happiness must depend. He had told himself that he would shake off this too human longing for a sweet face to be ever present with him at his board, for a sweet heart to cherish him with its love, for a dear head to lie upon his bosom. But he had owned to himself that it could not be shaken off, and, having so owned, was more sick than ever with desire. Mary and Clarissa were both out when he arrived, and he was closeted for a while with Patience. "How tired you must be of seeing me!" he said.

"Tired of seeing you? Oh, no!"

"I feel myself to be going about like a phantom, and I am ashamed of myself. My brother is successful and happy, and has all that he desires."

"He is easily satisfied," said Patience, with something of sarcasm in her voice.

"And my cousin Ralph is happy and triumphant. I ought not to pine, but in truth I am so weak that I am always pining. Tell me at once—is there a chance for me?"

Did it occur to him to think that she to whom he was speaking, ever asked herself why it was not given to her to have even a hope of that joy for which he was craving? Did she ever pine, because, when others were mating round her, flying off in pairs to their warm mutual nests, there came to her no such question of mating and flying off to love and happiness? If there was such pining, it was all inward, hidden from her friends, so that their mirth should not be lessened by her want of mirth, not expressed either by her eye or mouth, because she knew that on the expression of her face depended somewhat of the comfort of those who loved her. A homely brow, and plain features, and locks of hair that have not been combed by Love's attendant nymphs into soft and winning tresses, seems to tell us that love is not wanted by the bosom that owns them. We teach ourselves to regard such a one, let her be ever so good, with ever so sweet temper, ever so generous in heart, ever so affectionate among her friends, as separated alike from the perils and the privileges of that passion without which they who are blessed or banned with beauty would regard life but as a charred and mutilated existence. It is as though we should believe that passion springs from the rind, which is fair or foul to the eye, and not in the heart, which is often fairest, freshest, and most free, when the skin is dark and the cheeks are rough. This young parson expected Patience to sympathize with him, to greet for him, to aid him if there might be aid, and to understand that for him the world would be blank and wretched unless he could get for himself a soft sweet mate to sing when he sang, and to wail when he wailed. The only mate that Patience had was this very girl that was to be thus taken from her. But

she did sympathize with him, did greet for him, did give him all her aid. Knowing what she was herself and how God had formed her, she had learned to bury self absolutely and to take all her earthly joy from the joys of others. Shall it not come to pass that, hereafter, she too shall have a lover among the cherubim? "What can I say to you?" replied Patience to the young man's earnest entreaty. "If she were mine to give, I would give her to you instantly."

"Then you think there is no chance. If I thought that, why should I trouble her again?"

"I do not say so. Do you not know, Mr. Newton, that in such matters even sisters can hardly tell their thoughts to each other? How can they, when they do not even know their own wishes?"

"She does not hate me, then?"

"Hate you! no—she does not hate you. But there are so many degrees between hating and that kind of love which you want from her! You may be sure of this, that she so esteems you that your persistence cannot lessen you in her regard."

He was still pleading his case with the elder sister—very uselessly indeed, as he was aware; but having fallen on the subject of his love it was impossible for him to change it for any other—when Clarissa came into the room swinging her hat in her hand. She had been over at Miss Spooner's house and was full of Miss Spooner's woes and complaints. As soon as she had shaken hands with her lover, and spoken the few words of courtesy which the meeting demanded of her, she threw herself into the affairs of Miss Spooner as though they were of vital interest. "She is determined to be unhappy, Patty, and it is no use trying to make her not so. She says that Jane robs her, which I don't believe is true, and that Sarah has a lover—and why shouldn't Sarah have a lover? But as for curing her grievances, it would be the cruellest thing in the world. She lives upon her grievances. Something has happened to the chimney-pot, and the landlord hasn't sent a mason. She is revelling in her chimney-pot."

"Poor dear Miss Spooner," said Patience, getting up and leaving the room as though it were her duty to look at once after her old friend in the midst of these troubles.

Clarissa had not intended this. "She's asleep now," said Clarissa. But Patience went all the same. It might be that Miss Spooner would require to be watched in her slumbers. When Patience was gone Gregory Newton got up from his seat and walked to the window. He stood there for what seemed to be an endless number of seconds before he returned, and Clarissa had time to determine that she would escape. "I told Mary that I would go to her," she said, "you won't mind being left alone for a few minutes, Mr. Newton."

"Do not go just now, Clarissa."

"Only that I said I would," she answered, pleading that she must keep a promise which she had never made.

"Mary can spare you—and I cannot. Mary

is staying with you, and I shall be gone—almost immediately. I go back to Newton tomorrow, and who can say when I shall see you again?"

"You will be coming up to London, of course."

"I am here now at any rate," he said, smiling, "and will take what advantage of it I can. It is the old story, Clarissa—so old that I know you must be sick of it."

"If you think so, you should not tell it again."

"Do not be ill-natured to me. I don't know why it is but a man gets to be ashamed of himself, as though he were doing something mean and paltry, when he loves with persistence, as I do." Had it been possible that she should give him so much encouragement she would have told him that the mean man, and paltry, was he who could love or pretend to love with no capacity for persistence. She could not fail to draw a comparison between him and his brother, in which there was so much of meanness on the part of him who had at one time been as a god to her, and so much nobility in him to whom she was and ever had been as a goddess. "I suppose a man should take an answer and have done with it," he continued. "But how is a man to have done with it, when his heart remains the same?"

"A man should master his heart."

"I am, then, to understand that that which you have said so often before must be said again?" He had never knelt to her, and he did not kneel now; but he leaned over her so that she hardly knew whether he was on his knees or still seated on his chair. And she herself, though she answered him briskly—almost with impertinence—was so little mistress of herself that she knew not what she said. She would take him now—if only she knew how to take him without disgracing herself in her own estimation. "Dear Clary, think of it. Try to love me. I need not tell you again how true is my love for you." He had hold of her hand, and she did not withdraw it, and he ought to have known that the battle was won. But he knew nothing. He hardly knew that her hand was in his. "Clary, you are all the world to me. Must I go back heart-laden, but empty-handed, with no comfort?"

"If you knew all!" she said, rising suddenly from her chair.

"All what?"

"If you knew all, you would not take me, though I offered myself." He stood staring at her, not at all comprehending her words, and she perceived in the midst of her distress that it was needful that she should explain herself. "I have loved Ralph always—yes, your brother."

"And he?"

"I will not accuse him in any thing. He is married now, and it is past."

"And you can never love again?"

"Who would take such a heart as that? It would not be worth the giving or worth the taking. Oh—how I loved him!" Then he left her side, and went back to the window,

while she sank back upon her chair, and, burying her face in her hands, gave way to tears and sobs. He stood there perhaps for a minute, and then returning to her, so gently that she did not hear him, he did kneel at her side. He knelt, and, putting his hand upon her arm, he kissed the sleeve of her gown. "You had better go from me now," she said, amid her sobs.

"I will never go from you again," he answered. "God's mercy can cure also that wound, and I will be His minister in healing it. Clarissa, I am so glad that you have told me all. Looking back I can understand it now. I once thought that it was so."

"Yes," she said, "yes; it was so."

Gradually one hand of hers fell into his, and though no word of acceptance had been spoken he knew that he was at last accepted. "My own Clary," he said. "I may call you my own?" There was no answer, but he knew that it was so. "Nothing shall be done to trouble you—nothing shall be said to press you. You may be sure of this, if it be good to be loved—that no woman was ever loved more tenderly than you are."

"I do know it," she said, through her tears.

Then he rose and stood again at the window, looking out upon the lawn and the river. She was still weeping, but he hardly heeded her tears. It was better for her that she should weep than restrain them. And, as to himself and his own feelings—he tried to question himself, whether, in truth, was he less happy in this great possession, which he had at last gained, because his brother had for a while interfered with him in gaining it? That she would be as true to him now, as tender and as loving, as though Ralph had never crossed her path, he did not for a moment doubt. That she would be less sweet to him because her sweetness had been offered to another he would not admit to himself—even though the question were asked. She would be all his own, and was she not the one thing in the world which he coveted? He did think that for such a one as his Clarissa he would be a better mate than would have been his brother, and he was sure that she herself would learn to know that it was so. He stood there long enough to resolve that this which had been told him should be no drawback upon his bliss. "Clary," he said, returning to her, "it is settled?" She made him no answer. "My darling, I am as happy now as though Ralph had never seen your sweet face, or heard your dear voice. Look up at me once." Slowly she looked up into his eyes, and then stood before him almost as a suppliant, and gave him her face to be kissed. So at last they became engaged as man and wife—though it may be doubted whether she spoke another word before he left the room.

It was, however, quite understood that they were engaged; and, though he did not see Clarissa again, he received the congratulations both of Patience and Mary Bonner before he left the house; and that very night succeeded in hunting down Sir Thomas, so

that he might tell the father that the daughter had at last consented to become his wife.

CHAPTER LVIII.

CONCLUSION.

CLARISSA had found it hard to change the object of her love—so hard, that for a time she had been unwilling even to make the effort—and she had been ashamed that those around her should think that she would make it; but when the thing was done, her second hero was dearer to her than ever had been the first. He at least was true. With him there was no need of doubt. His assurances were not conveyed in words so light that they might mean much or little. This second lover was a lover, indeed, who thought no pains too great to show her that she was ever growing in his heart of hearts. For a while—for a week or two—she restrained her tongue; but when once she had accustomed herself to the coaxing kindness of her sister and her cousin, then her eloquence was loosened, and Gregory Newton was a god indeed. In the course of time she got a very pretty note from Ralph, congratulating her, as he also had congratulated Polly, and expressing a fear that he might not be home in time to be present at the wedding. Augusta was so fond of Rome that they did not mean to leave it till the late spring. Then, after a while, there came to her, also, a watch and chain, twice as costly as those given to Polly—which, however, no persuasion from Gregory would ever induce Clarissa to wear. In after-time Ralph never noticed that the trinkets were not worn.

The winter at Popham Villa went on very much as other winters had gone, except that two of the girls living there were full of future hopes, and preparing for future cares, while the third occupied her heart and mind with the cares and hopes of the other two. Patience, however, had one other task in hand,

a task upon the performance of which her future happiness much depended, and in respect to which she now ventured to hope for success. Wherever her future home might be, it would be terrible to her if her father would not consent to occupy it with her. It had been settled that both the marriages should take place early in April—both on the same day, and, as a matter of course, the weddings would be celebrated at Fulham. Christmas had come and gone, and winter was going, before Sir Thomas had absolutely promised to renew that order for the making the packing-cases for his books. "You won't go back, papa, after they are married," Patience said to her father, early in March.

"If I do it shall not be for long."

"Not for a day, papa! Surely you will not leave me alone? There will be plenty of room now. The air of Fulham will be better for your work than those stuffy, dark, dingy lawyers' chambers."

"My dear, all the work of my life that was worth doing was done in those stuffy, dingy rooms." That was all that Sir Thomas said, but the accusation conveyed to him by his daughter's words was very heavy. For years past he had sat intending to work, purposing to achieve a great task which he set for himself, and had done—almost nothing. Might it be yet possible that that purer air of which Patty spoke should produce new energy, and lead to better results? The promise of it did at least produce new resolutions. It was impossible, as Patience had said, that his child should be left to dwell alone, while yet she had a father living.

"Stemm," he said, "I told you to get some packing-cases made."

"Packing-cases, Sir Thomas?"

"Yes—packing-cases for the books. It was months ago. Are they ready?"

"No, Sir Thomas. They ain't ready."

"Why not?"

"Well, Sir Thomas—they ain't; that's all." Then the order was repeated in a manner so formal as to make Stemm understand

that it was intended for a fact. "You are going away from this; are you, Sir Thomas?"

"I believe that I shall give the chambers up altogether at midsummer. At any rate, I mean to have the books packed at once."

"Very well, Sir Thomas." Then there was a pause, during which Stemm did not leave the room. Nor did Sir Thomas dismiss him, feeling that there might well be other things which would require discussion. "And about me, Sir Thomas?" said Stemm.

"I have been thinking about that, Stemm."

"So have I, Sir Thomas—more nor once."

"You can come to Fulham if you like—only you must not scold the maids."

"Very well, Sir Thomas," said Stemm, with hardly any variation in his voice, but still with less of care upon his brow.

"Mind, I will not have you scolding them at the villa."

"Not unless they deserve it, Sir Thomas," said Stemm. Sir Thomas could say nothing further. For our own part we fear that the maidens at the villa will not be the better in conduct, as they certainly will not be more comfortable in their lives, in consequence of this change.

And the books were moved in large packing-cases, not one of which had yet been opened when the two brides returned to Popham Villa after their wedding tours, to see Patience just for a day before they were taken to their new homes. Nevertheless, let us hope that the change of air and of scene may tend to future diligence, and that the *magnus opus* may yet be achieved. We have heard of editions of Aristophanes, of Polybius, of the Iliad, of Ovid, and what not, which have ever been forthcoming under the hands of notable scholars, who have grown gray amid the renewed promises which have been given. And some of these works have come forth, belying the prophecies of incredulous friends. Let us hope that the great Life of Bacon may yet be written.

THE END.

APPLETONS' JOURNAL

LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 114.—VOL. V.]

SATURDAY, JUNE 3, 1871.

[PRICE TEN CENTS.]

THE OLD MILL.

IT stands in rustic beauty there,
Crowning the valley rich and fair,
And wheel and flume are still.
Dark rafters tilt from wall to floor,
Creaks in the wind the battered door
Of the old deserted mill.

Rank herbage clogs each crannied nook,
And straggling branches overlook
The haunts of rat and owl.
It leans beside the mossy way,
Like some lone friar in hoddengray
With earth-averted cowl.

Hushed is the clatter which it made,
And merry forms that round it played
Have vanished, one by one!
Yet stands the old, deserted mill
Breathing its happy memories still
Of days forever gone.

Soft, silvery laughter rings around,
And lovers' footsteps press the ground
At eve's first pearly star;
The miller's carol, blithe and clear,
Borne on the fragrant breeze I hear
Echoed o'er woodlands far.

And through the door-way, once again—
Like phantoms through a madman's brain—
Glide forms of long ago!
Once more I hear the busy hum
Of voices, as they go and come,
Melodiously low.

Again the stream in pure delight
Leaps to its work with hands of might
And twirls the ponderous wheel;
While every impulse of my youth,
Each faded joy, in love and truth,
Again, again I feel!

All vanishes, like morning mist
By the warm sunbeams fondly kissed—
However it may be.
Oh, there are hearts that I have known,
And they, each hope and passion flown,
Seem like this mill to me!

For still the busy hum goes on
Till each allotted task is done,
Our passing years to fill.
And then the waiting flood-gate drops,
And Death, the miller, kindly stops
The old, deserted mill!

GEORGE COOPER.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER XXIII.—A MORNING-CALL.

GREAT was the rejoicing of the Marks children when, on the day after New-Year, the same carriage that had conveyed Miss Tresham away drove up to the gate, and Miss Tresham descended, smiling in acknowledgment of their eager welcome, but looking decidedly pale and worn, as Mrs. Marks at once perceived.

"Dissipation don't agree with you, Miss Katharine," she said, after the first bustle of greeting was over. "I never saw you look so badly. You must have danced all last night."

"I did," said Katharine, smiling. "After the *tableaux* we had a sort of fancy ball—that is, all those who had taken part in the *tableaux* were in costume—and day was breaking when I went to bed. I wish you had come to the *tableaux*, Mrs. Marks—they were so pretty!"

"I thought about it," said Mrs. Marks, regretfully. "I should have liked to have gone; but it was a long drive, and Nelly had a cough that sounded a little like croup, so I was afraid to leave her."

"But you might have sent Sara and Katy; they would have enjoyed it so much!"

"They were crazy to go, and I might have sent them if there had been anybody to take them. But Richard was tired, and John isn't here, you know."

"Indeed, I don't know," said Katharine, with a start. "Where has Mr. Warwick gone?"

"Gone to take Felix Gordon to school," answered Mrs. Marks, sending her scissors with a sharp snip through the cloth from which she was cutting a jacket for one of the boys. "You can't be more surprised than I was, Miss Katharine; for John started off without giving anybody a word of warning. It was a queer thing for Mrs. Gordon to send the child away—so fond of him as they say she is—and it was queer of John to take him; but, then, dear me! what isn't queer in this world? I told Richard last night that I shouldn't be surprised if every thing came right at last. You know what I mean; I don't like to mention names before the children."

"Yes, I know what you mean. But is it likely, do you think?"

"If this don't look as if it is likely, I wonder what would look so? Other people besides me think the same thing. I saw Mrs. Sloan yesterday, and she was telling me that Mrs. Gordon—Katy, don't stand there drinking in every word I say; go up-stairs and see if Miss Tresham's room is all ready—that Mrs. Gordon has been going to see John at his office of late, and, when a widow does that way, you know it is apt to mean something. There are a great many reports going about; but I know how people talk, and I didn't pay much attention to them till this about Felix came on me like a thunder-clap. Then I couldn't help believing. I am sure I never expected that matters would come to pass so that John could marry Pauline Morton—but this is a strange world!"

"When will Mr. Warwick be back?" asked Katharine.

"Indeed, that's more than I can tell. He said nothing about it; and, since I don't know where he went, I can't even calculate when he's likely to be back. He left a note for you, which I was about to forget. Let me see—where did I put it?"

After considerable reflection, Mrs. Marks remembered that she had put the note in her work-box, and drew it forth from among the spools and tape which filled that receptacle. Katharine, who restrained her impatience as well as she could, took it and opened it. This was what Mr. Warwick said:

"DEAR MISS TRESHAM: I find that I am unexpectedly obliged to leave home with Felix Gordon. I shall endeavor to return within a fortnight. Will you go to see Mrs. Gordon and try to cheer her? She is suffering very much. Yours truly,

"JOHN WARWICK."

"Does he say any thing about when he's likely to be back?" asked Mrs. Marks, who was watching the governess's face attentively, and secretly burning with curiosity to know what her brother had written about.

"He says he may return within a fortnight," answered Katharine, with her eyes still fastened on the note. Then she held it out. "There it is," she added; "you can see for yourself what he says. It is not much. I will go and take off my things."

While Mrs. Marks eagerly read the note Katharine left the room and went up-stairs. She found her chamber carefully arranged for her. Every thing looked fresh and bright, the fire was burning, and on the table her Christmas presents were laid out in order. It seemed like a pleasant coming home, and gave her a sense of rest and relief after the gay dissipations of Annesdale. At another time she might have thought a little regretfully of all that was going on at the latter place; of how Mr. Langdon was just then throwing a great deal of sentimental expression into his voice and eyes as he talked to some young lady who sat in the bay-window where she had herself sat yesterday; of how Miss Lester was playing billiards with Mr. Talcott; how Mrs. French was entertaining a lively group with disquisitions on private theatricals; and how the same people were loitering in the same places and saying the same things as on every day while she had been there. The habits of society are much the same on a small or on a large scale all the world over. Let a man drop out of his circle in Paris, and, even if he has been the brightest star in that circle, who misses him? So it is in every circle of every city, village, or hamlet, throughout the world. Remain, and you are liked exactly according to your deserts; go, and, whatever those deserts may have been, you are forgotten as speedily and as naturally as the events of yesterday yield in interest to the events of to-day. Until a cloud came over her brightness, Katharine had achieved quite a social success at Annesdale; but she had sufficient worldly experience to know

* ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

that already she had sunk beneath the horizon, that others had taken her place, and that to-morrow people would even cease to say, "Miss Tresham did this," or "Miss Tresham did not do that." At a different moment such a reflection might have cost her a pang; but now she was too full of other subjects. Instead of thinking of the farewells of Messrs. Langdon and Talcott, she thought of Mr. Warwick and the note he had left behind. "What did he mean?" she asked herself, and, receiving no satisfactory reply, was still asking, when the door opened and Katy rushed in.

"Miss Tresham, there's a gentleman down-stairs, and mamma says will you please come down, he wants to see you."

Poor Katharine! She had expected this, but not quite so soon—not quite so unexpectedly.

"Katy," she said, with a start, "who is it? What is his name?"

"He's a strange gentleman," answered Katy, decidedly. "I don't know what his name is, and mamma didn't tell me. He came here once before, though."

"To see me?"

"Yes'm, while you was away."

"Amen," said Katharine, under her breath. She mechanically took off her bonnet and shawl, smoothed her hair, and went down-stairs.

In the passage she met Mrs. Marks, evidently much fluttered and excited.

"A gentleman in the dining-room to see you, Miss Katharine," she said. "I asked him there because there was no fire in the parlor. You needn't be uneasy on my account," she added, with a good-natured smile, "I am going into the kitchen anyhow. They are trying out lard again to-day, and I have to see about it. He's very good-looking," she said, with a significant nod, as she went out of the back-door.

Katharine did not even smile. The conclusion to which Mrs. Marks had leaped was absurd enough; but she was not in the humor for the absurdity to strike her in a humorous light. On the contrary, she felt annoyed when there was no reasonable ground for annoyance. These significant looks and smiles jarred on her.

"What fools people are!" she thought, with an impatience very unusual to her, as she went on and opened the dining-room door.

St. John was standing with his back to the fire, looking moodily down at the hearth-rug when she entered. She saw at once that something was wrong with him, and, unfortunately, was in no doubt concerning the nature of that something. He looked up when she entered, but did not move forward.

"Well," he said, "have you heard the news? Do you know that she has sent off the child, and given me the slip?"

"Yes, I know it," she answered, sitting down in the first chair she came to. "But what can I do? Why do you come and annoy me?"

"That is always the cry!—always, why do I come and annoy you! I come because I choose to do so," said he, angrily; "and because you may be able to help me in this business."

"In what business?"

"In finding out where Felix has been taken."

"What is the use of such talk as this," said she, coldly. "Do you suppose I know any thing about it?—or, if I did, do you suppose I would tell you?"

"I suppose you can find out, if you choose, for the man who took him away lives, I am told, in this very house—and, I suppose that, if you don't choose, you may repent it," answered he. "I don't want to hear any nonsense, Katharine. This is a matter of life and death to me, and I will not be thwarted. You can find out where the child has been taken, and you shall do so."

"I might show you whether or not I would, if there were any question of finding out," she answered. "But there is not. Even his own sister does not know where Mr. Warwick has gone."

"She may say she does not—"

"She says the truth. Don't think that everybody tells falsehoods, St. John."

"Everybody tells them when it suits his convenience," said St. John, coolly. "Do you suppose I don't know the world?"

"Your own world—perhaps so."

"The world is the same everywhere. If this woman does not know, her husband does."

"No—he does not."

"Then wait until the man comes back, and get the secret from him. What's the good of being a woman, and a pretty one," he added, with a sneer, "if you can't do such a thing?"

"You don't know any thing about Mr. Warwick," she cried, indignantly. "If you did, you would know that no woman in the world could make him tell a thing that he wished to keep secret. And I would do any thing sooner than ask it of him. St. John, you are cruel!"

"You are a fool!" retorted St. John, shortly. "I think there must be something between you and this lawyer," he went on, looking keenly at her. "If that is the case—"

"I won't hear another word!" cried Katharine, losing temper, and somewhat dimming him by the angry light that came into her eyes. "You are insulting me—and I will not listen to you. If I knew where Felix Gordon was this minute, I would die sooner than tell you!" she said, passionately. "You may be sure of that."

"I think I could make you sorry for it."

"I have no doubt you could—but I would not do it!"

There was silence in the room after this. St. John had not expected such a defiance, and it quite astonished him. He drummed on his hat for some time, and knitted his brows, as he scowled at the girl, who sat before him looking pale and resolute.

"Upon my word, I had not expected this," said he, at last. "A charmingly affectionate person you are, Katharine, I must say! You'd die before you would obtain for me a certain item of information about a person who cannot concern you in the least! Will you tell me what is the meaning of this sudden interest in Felix Gordon?"

"I have no interest. But I will not play the spy at your bidding. I owe a debt of gratitude to this place, and these people; and I do not choose to repay it in such a form."

"A debt of gratitude for allowing you to come and slave among them? Humph! your ideas of a cause for gratitude are singular, to say the least. You do owe somebody among them a certain sort of gratitude, though," he went on, with a peculiar smile. "Pray, what do you consider the most unfortunate thing that has befallen you lately?"

"Your coming," she answered, unhesitatingly.

"I thought so," said he, coolly. "Well, you asked me, when we first met, how I discovered your place of residence. I did not answer the question then, because it was irrelevant. It is relevant now, and I shall answer it with pleasure. First, however, do you know any one in a place called Mobile?"

"No one."

"Have you ever been there?"

"Never."

"Well, your address was forwarded to me—but stop! I will tell the story in order. There is nothing like method. Read that."

He took out a pocket-book, opened it, and drew forth a slip of paper which he put into her hand. It was the *Times* advertisement that Mrs. Annesley had shown to Adela French.

"Have you any idea who inserted that?" he asked, watching her face, as she read it.

Her eyes dilated with astonishment, her face paled until the very lips were white, and he was forced to repeat his question, before she looked up and answered.

"Idea!—no. How should I have? I did not think there was any one in the world who would have done such a thing."

"Do you think it was some one here?"

"It must have been. I have never been anywhere else in America, and no one who was not of Lagrange could have known any thing about the West Indies or Cumberland."

"Those allusions prove that it is some one who knows you?"

"Yes, it is some one who knows me."

"See if these will enable you to tell who it is."

Forth from the pocket-book came two letters, and were placed in Katharine's hand. She took them, as she had taken the advertisement, and glanced over them with compressed lips. When she finished, she laid them down on the table beside her, and looked at St. John.

"I do not know who has written these," she said. "God forgive whoever it was—God grant that they may never have to endure such suffering as they have brought on me!"

"That is cant," said he. "Of course, you don't forgive them; and, of course, you can tell who the writer was. What, in a small

circle like this, not be able to place your finger at once upon the person! Tell me whom you know, and I will tell you who did it."

"I do not know anybody who would have done it."

"That only proves your ignorance of the world. Do you suspect me of forging those letters?"

"No."

"Then they were certainly written by somebody who knows you, and whom you know. Common-sense might show you this. Tell me whom you least suspect, and I will tell you who did it."

"I cannot tell you. I—St. John, let me alone!" she cried, suddenly, but with an accent of almost heart-rending pathos. "I don't understand any thing! I am heart-sick and weary. Don't—don't torment me!"

"You know who wrote those letters," said St. John, watching her with unchanging scrutiny. "If you don't choose to tell me, well and good—I can find out for myself. You will be sorry for this want of confidence though, Katharine. I am your best friend."

"May God give me my worst, then!" cried the girl, who was driven beyond all power of self-control.

"I have heard some rumors about you," pursued the immovable St. John. "It is quite useless to try to deceive me—I should think you would have discovered that long before this time. Who was the gentleman that was kind enough to show me out of the grounds of the house where you were staying the other day?"

"I am going," said Katharine, rising and walking toward the door. "If you have only come to torment me as you used to do, I will not stay to afford you amusement. I am sick and weary—I am going."

"I shall remain here until you come back, then."

"St. John," cried she, facing round upon him, "what is the meaning of this? You promised me that, after I gave you some money, you would go; and you are here yet, to make life a burden to me."

"I made no promises," said St. John, "and I will make none. But I tell you that I will come here every day until you find out—as you can, if you choose—where that boy has been taken to. I have written to Gordon, and he will come, expecting to find the child here. If he is not here—if I cannot put my hand upon him—it will be worse than useless to have summoned him."

"Write and tell him so."

"No letter would reach him now."

Katharine sank back into her chair, and gazed out of the window at the desolate garden which had been so fair and smiling on that November evening when she first saw Mrs. Gordon's face. She could have cried out upon the cruelty of all this, but where was the use? All the tears of Niobe could not have moved the man before her one hair's-breadth from his purpose. The nether millstone is not half so hard as the selfish resolution of a selfish nature. While she was still sitting in hopeless silence, and St. John was still standing on the hearth-rug waiting her reply, there came a stir in the passage outside, a movement of feet, a sound of voices, Miss Tresham's name audibly pronounced, and, before Katharine could move forward, the door opened, and Mrs. Gordon stood on the threshold!

CHAPTER XXIV.—OLD FOES.

It had been a relief to Mrs. Gordon to tell her story to Annesley, and the exhaustion consequent upon long and painful emotion had made her sleep heavily during that night—the first night after Felix had been parted from her. But who can paint the waking—the next day—the long watches of the next night? As hour after hour rolled by, she endured them in much the same passive fashion as that which had so much surprised Morton. But, on the third day, this endurance began to give way to restlessness. Babette, who went in and out on various pretexts, and watched her anxiously, immediately perceived this. She had shortly before been to town on an errand, and she now bethought herself of an expedient to interest her mistress.

"Madame is not well," she said, planting herself on the hearth-rug, with an air of determination. "Madame is lonely—she should have company. As I was coming home, I met mademoiselle—the young lady who comes here with the children. Why should not madame send for her? She would cheer her up."

"Nobody can cheer me up, Babette," said Mrs. Gordon, smiling faintly. "I am used to trouble, and I can bear it; but, as for cheer—that is a different matter. Don't talk of it."

"Madame will be ill, if she is not cheered," said Babette, obstinately. "If madame would only send for the young lady—"

"Is it Miss Tresham you are talking about?" asked Mrs. Gordon, languidly. "Did you say that you met her going into town?"

"A short time ago, madame."

"Well, you may send or stay—no, I will go myself. Order the carriage."

"Madame!"

"The carriage," repeated Mrs. Gordon, impatiently. "Don't you see that I must get out of this house or go crazy? I will go into Tallahoma, and bring Miss Tresham back to stay with me. You are right. She will do me good—if anybody can."

"But Monsieur St. Jean!" cried Babette, who was aghast. "If madame goes into town, she may meet him."

"He cannot harm me," said madame, haughtily, for she could afford to be brave now that Felix was safely out of reach. "Go and order the carriage."

Babette went at once; but, owing to the fact that the horses were out on the plantation, and had to be sent for, it was some time before the carriage came round. Mrs. Gordon's fit of restlessness had by that time partly subsided, and she was half inclined to give up her intention, and merely send Babette with a note to bring Katharine. But Babette was of the opinion that it would be beneficial for madame to go herself, that a breath of the outer air would revive her, and the sight of the outer world be good for her. In cases where the mind has too long preyed on itself, there is, indeed, no better prescription than this—simple as it seems. He must be very far gone in morbid gloom whom God's air, and God's sunshine, and the bright, rejoicing beauty of God's fair earth, cannot comfort, cannot help, cannot draw a little out of himself. Beguiled by the persuasions of her faithful attendant, Mrs. Gordon at last consented to go. The Frenchwoman put her into the carriage, and saw her drive off, with great self-congratulation. It is possible that this self-congratulation might have been slightly changed if she had only known who it was that her mistress had gone to meet.

On her way to Tallahoma, Mrs. Gordon was a little diverted from the subject of her own troubles, by thinking of the pleasure of bringing Katharine back to Morton House with her. She felt certain that Mrs. Marks would not object, for Mr. Warwick's last words had advised something like this, and she thought it probable that he might have spoken to his sister on the subject. She liked the girl—liked her bright face, her frank bearing, her sunny smile—and she felt that it would be a great relief to see her moving about Morton House, and lighting up the gloom with her graceful youth, instead of poor Babette's long face and ready tears. As she was drawing this half-unconscious picture, Katharine was going down to meet St. John, with a very pale face, and a very heavy heart, making quite a contrast to the girl whom Mrs. Gordon had seen last—the girl who even then was pictured in Mrs. Gordon's mind.

When the carriage drew up before the Marks house, two or three children were playing in the yard. They all stopped, and stared open-mouthed, as Mrs. Gordon descended. When it was evident that she intended to enter the gate, they immediately took flight, and ran full tilt to the kitchen—rushing headlong through the door, and very nearly tumbling into a pot of boiling lard.

"Mamma, here's a carriage, and a lady coming in!" cried Katy, who was first.

"Mamma, it's a lady in black—I think it's Felix's mother," panted Sara, who was second.

"Mamma—lady tummin'," said Nelly, who was last.

"A lady in black!—Felix's mother! Good gracious!" cried Mrs. Mark's. "Run, Letty, and ask her in—in the parlor, mind. I'll be there in a minute. Get away, children, and let me take off this apron. Good gracious!—who was to think—"

While Mrs. Marks was hastily untying her apron, and Letty was running full speed to the house, Mrs. Gordon walked up to the front door, and was about to knock, when Jack came rushing down-stairs. He had been to the school-room to get some string for his kite, and was on his way back to the place where he had left that valuable article of property, when he was thus unexpectedly brought face to face with a strange lady. Fortunately, he was not at all troubled with diffidence; so he went forward, and, when Mrs. Gordon asked if Miss Tresham was at home, at once responded in the promptest manner imaginable:

"Yes'm, Miss Tresham's at home—she got home a little while ago. She's in the dining-room, I b'lieve."

"Can I see her?"

"Oh, yes'm—walk in. This way, please."

His hand was on the lock of the dining-room door, when, enter Letty on the scene—panting and almost breathless.

"Not that way, Mass Jack," cried she, eagerly. "Ask the lady in the parlor. This way, ma'am."

She hurried forward to the parlor-door, and Mrs. Gordon half turned to follow her, when Jack, who was always at feud with Letty, asserted his superior knowledge.

"The lady wants to see Miss Tresham," said he, in a loud voice, "and Miss Tresham ain't in the parlor, she's in here. There she is, now," he added, triumphantly, as he threw open the door, and revealed Katharine, who was sitting almost immediately in front of it.

Mrs. Gordon saw her, and at once advanced into the room. She did not see St. John, who was out of her range of vision, so she began speaking, as she crossed the floor.

"Miss Tresham, I hope you will excuse me—"

Here she stopped suddenly. Something in Katharine's face startled her, and made her look round. Then she saw her companion.

To describe the change that passed over her would be impossible. If she had expected to see him, if she had thought there was even the least reason to fear a meeting with him, she would have prepared for it—being a proud woman, and one who would suffer any thing sooner than let an enemy read her weakness. But, as it was, she had no time for preparation. When she turned and saw that so well-remembered, that so bitterly-hated face, it was as if a sudden, brutal blow had been dealt to her. She gave a sharp cry, and covered her own face with her hands.

The door was still open, and Jack and Letty were holding an altercation in the passage, which filled up, strangely enough, the interval that followed.

"Never mind, Mass Jack—I'll tell mistis. Puttin' yourself forrard when she told me to ask the lady in the parlor!"

"You mind your own business—I'll tell mamma myself. The lady asked for Miss Tresham, and I wasn't a-going to show her in the parlor. There ain't any fire in there, either."

This was what came into the room, while Mrs. Gordon clasped her hands over her face, St. John stood undecided what to do or say, and Katharine felt a despair which bordered closely upon recklessness. She could have laughed, or she could have cried; but, instead of doing either of the two, she heard, with the odd double consciousness that came to her in moments of excitement, the recrimination in the passage, and even caught the angry whisk of Letty's dress as she departed.

Nevertheless, Katharine was the first who recovered self-possession. Seeing that St. John was about to speak, she silenced him by a glance, and walked up to Mrs. Gordon.

"Will you let me take you into the other room?" she said, gently. "I am very sorry for—for this."

The sound of her voice seemed at once to restore Mrs. Gordon to herself. She looked up with a start. Then her whole face changed—petrified, as it were—and she drew back, so that not even her dress might touch the girl—drew back as she might have drawn back from a scorpion.

"So it was you!" she said. And her voice was so cold and hard, so changed in timbre, that it made Katharine shrink.

"What was me?" she asked, as the other paused and said no more. "I do not understand. What was me?"

"It was you who gave the clew to my place of refuge," answered Mrs. Gordon, with the same repellent coldness of voice and manner. "I see it all now. I was foolish enough to like you—to welcome you into my house—to encourage my cousin in his love for you—and you gave me this return! Thank you, Miss Tresham—thank you for proving to me once more that the wisest person in the world is the person who neither gives nor hopes to receive regard."

"St. John," said Katharine, turning round, "do you hear this? Do you stand by and say not one word to exonerate me from such an accusation?"

"What can I say?" asked St. John, carelessly. "Mrs. Gordon ought to know that she is talking nonsense—that, if you had told me a dozen times over where she was, she had no claim upon you to make such an act any thing but natural.—But Miss Tresham did not tell

me," he added, turning to Mrs. Gordon. "I came here in total ignorance of your having chosen this as a place of residence. After I discovered the fact, it was my duty to inform your husband; and that duty I fulfilled."

"I beg your pardon," said Mrs. Gordon, addressing Katharine with her utmost stateliness of tone and bearing. "I had no right to speak to you as I did a moment ago. I am not by nature a patient woman, and trouble has tried me severely. I hope you will let this plead my excuse. As Mr. St. John said, it is certainly true that I have no claim upon you—no right to hope that you would respect my unfortunate position sufficiently to refrain from betraying me to—"

She stopped, gasped slightly, as if threatened with suffocation, and her hand went up to her throat. Before Katharine could speak, however, she went on:

"I ought to apologize for this intrusion. When I entered the room, I thought you were alone. I came to see you, to ask you to return to Morton House with me, to beg you to cheer the solitude which Felix's absence has made so dreary. After this meeting, I shall not press that request. I shall only bid you good-morning."

She bowed slightly, drew her veil over her face, and turned to leave the room—a "grand lady," unmistakably, and, so far, commanding much the best of the situation.

But at this point Katharine spoke, her clear, quiet tones seizing Mrs. Gordon's attention, and, almost perforce, arresting Mrs. Gordon's steps.

"If you will allow me, madam, I have a few words to say in my defence. It seems that you disbelieve Mr. St. John's assertion. Will you disbelieve mine when I tell you that I did not bring him here, and that I knew nothing of his acquaintance with you until he himself informed me of it?"

Mrs. Gordon turned, and raised her veil again. The two women faced each other for a minute before the elder spoke—spoke with a certain quiet contempt in her voice.

"I confess that your question seems to me unnecessary, Miss Tresham. Having granted your right to inform Mr. St. John of my place of abode, I can see no reason for uselessly prolonging this discussion. Why should it matter to you whether or not I believe you to have done so?"

Katharine flushed at the tone; but she controlled herself, and held to her point with steady dignity.

"Unnecessary or not, will you be kind enough to answer my question?"

"If you force me to speak, I must answer, then, that I do believe it."

"In the face of my assertion to the contrary?"

"In the face of any assertion given by any friend of Mr. St. John's."

Hot words leaped to Katharine's lips; but she held them back. Even at this moment she had sufficient strength of will to restrain herself—to remember that he who loses temper loses many things besides, and that angry rejoinder never yet helped a cause. She had a hard fight for self-control; but she fought it bravely, and after a minute she was able to command her voice sufficiently to reply.

"I am your debtor, Mrs. Gordon, for the first direct insult that was ever offered to me in my life. I asked your attention before as a courtesy; I demand it now as a right. You have seen fit to charge me with falsehood with regard to a matter in which, according to your own admission, I should have no reason to deny the truth. I will now prove to you that you have done so without a shadow of just cause."

She walked across the floor, and took the *Times* advertisement from the table where she had laid it.

"Will you read this?" she said, coming back and offering it to Mrs. Gordon.

"I cannot imagine—" began the latter, haughtily.

"Read it," said Katharine, interrupting her with grave resolution. So constrained, Mrs. Gordon took the slip of paper and read:

"If the friends or relations of Katharine Tresham, formerly of the British West Indies, and lately of Cumberland, England, are desirous of knowing her present whereabouts and address, they can obtain this information by addressing R. G., Box 1,084, Mobile, Alabama."

Having read it, she looked up.

"I confess that I do not understand this," she said.

"Perhaps these will enable you to do so," answered Katharine, offering the letters in turn.

The first one which Mrs. Gordon opened—the one which chanced to be the last, and in which the writer gave Miss Tresham's address, and asked information concerning her for "personal and family" reasons—startled her no little. Her eyes had scarcely fallen on the writing before she changed color. As she read on, her face assumed an expression which puzzled Katharine. It did not puzzle St. John, however. Still master of himself, and quietly biding his time, he coolly watched Mrs. Gordon, and coolly arrived at a conclusion.

"She either knows or strongly suspects who is the writer," he said to himself. "I shall remember that."

After Mrs. Gordon finished reading the letter, she stood for some time with it in her hand, apparently deep in thought. Then she roused herself, and opened the other. She merely glanced over this, folded it up, and turned to Katharine.

"Miss Tresham," she said, with formal courtesy, "I apologize. I see that you were not the person who brought Mr. St. John to Langrange, and I retract my assertion to that effect. Are you satisfied?"

"I am satisfied, madam," answered Katharine, as coldly as herself.

"Will you allow me, then, to inquire if you have any idea who inserted this advertisement and wrote these letters?"

"I have not the least idea."

Here St. John made a step forward, and was about to speak, when Mrs. Marks appeared at the still open door, in her best company dress and with her best company smile.

"I heard that Mrs. Gordon was here," said she, advancing into the room, "and I could not help coming to—" Here the good woman stopped, awed, amazed, by the face that looked at her, overpowered by a sudden rush of feeling which swept away all thought of conventional greeting or conventional compliments. "O Miss Pauline! It can't be Miss Pauline!" she cried, with an almost pitiful astonishment in her voice. "I—I—O Mrs. Gordon! excuse me, but such a change—"

"You, at least, are not changed," said Mrs. Gordon, extending her hand. "The same Bessie Warwick that I knew once—the same Bessie Warwick, with the same honest face. Will you take me somewhere—anywhere—so that I can speak to you alone?" she went on, much to Mrs. Marks's surprise. "I am glad to see you; for I have something that I should like to say to you."

"I—certainly—if you don't object, I will take you to my own room," said Mrs. Marks, looking in bewildered surprise from Katharine to St. John, and from St. John to Mrs. Gordon. "I told Letty to make a fire in the parlor; but I don't expect it is burning yet, and I couldn't ask you to go into the cold. My room is in great confusion, for the children make such a litter; but if you wouldn't mind—"

"Anywhere," said Mrs. Gordon, faintly. Already her excitement was ebbing, her strength was failing, and the room was growing black before her eyes. "I am ready," she added.

She took Mrs. Marks's arm as a support, and turned to leave the room, but before she had made three steps, St. John stood before her—barring the only mode of egress.

"It is quite useless for you to think that you can carry off matters in this way with me, Mrs. Gordon," he said, in a tone of contemptuous amusement. "I understand, from various rumors, that you have sent Felix away, and that you intend to conceal his place of residence, as you have already concealed your own, from his father. Individually, I have no right to interfere with your plans; but I think it well to inform you that your husband"—she shrank at the word—"will be here in a short time, and that he will use every means to discover the child, and to punish, with the utmost rigor of the law, those who have aided you in concealing him."

"Oh!" cried poor Mrs. Marks, and turned a glance on Mrs. Gordon, as if to say, "Can this be true?"

But Mrs. Gordon did not heed the glance. St. John's tones and words had waked all the fire of combat within her—all the haughty spirit of resistance which years of tyranny had failed to subdue.

"Tell the man for whom you are acting," she said, with all languor gone from her face, and all weakness from her voice, "that if he is wise, he will spare himself the trouble of coming here; for no human power shall ever make me see him again. Tell him that Felix is safe

from him; and that those who have the child in charge, are neither so poor nor so weak as to be frightened by threats of any penalty which it is in his power to inflict. Tell him, also," she added, with a sudden flash in her eyes that absolutely made St. John recoil a step, "that he had better think twice before he comes to seek the sister of Alfred Morton in her own home, and among her own kindred. I have only to speak, and there are men here who would ask nothing better than to take the matter of vengeance into their own hands."

"You know your husband, madam," said St. John, quietly. "You know whether such threats as that are likely to influence him."

"As for you," she went on, with passion so intense that it made her whole frame quiver, and her voice rise to that infinite height of tragic emotion which only the greatest actors have ever been able to imitate, "if I have spared you, it has been because I recognized the fact that you are simply a tool, and, consequently, that you are below any thing save contempt. But if you trouble me again, I say to you, as I said of him, that there are men who would ask nothing better than to rid me of you summarily. You will do well to remember this!"

"If your friends will be kind enough to call on me, madam," said St. John, with superb coolness, "I shall be happy to receive them. I can make them accountable for the words you have just addressed to me, because I have endeavored, as your husband's friend, to serve his interests."

"My dear Mrs. Gordon, let—let me take you to my room," said Mrs. Marks, breaking in here with a half-bewildered tone of expostulation. "I—had no idea of any thing like this, or I should not have come in. If this gentleman will move aside—"

The gentleman moved aside in acknowledgment of this request; but Mrs. Gordon stood still—the glow was yet on her face, and it was evident that she had yet something to say. This time she addressed herself to Mrs. Marks:

"I wished to speak to you in private," she said; "but it is not worth while. The warning which I desired to give you—which it is my duty to give you—had better be spoken in the presence of the person against whom it is directed. I find Mr. St. John apparently at home in your house. I do not know how long this has been the case, nor how long it is likely to continue; but I warn you that, if you were aware of his real character, he would not remain within your doors five minutes. I speak of this character, because I know it to my cost. He is the unprincipled instrument of another man whom it is my misfortune to call my husband. Miss Tresham has sufficiently shown that she has some close connection with him. What that connection is, it does not concern me to inquire. Whether or not it concerns you, is a matter which I leave for yourself to decide."

"Miss Katharine!" cried Mrs. Marks, with one great culminating gasp of astonishment. She turned and looked at her governess with an air of appeal. Plainly she meant to say, "Answer for yourself."

But, as it chanced, Mrs. Gordon's last words had tried Katharine's patience to its utmost limit. She had, so far, curbed herself steadily—wonderfully, in fact, considering how much she had borne before Mrs. Gordon's entrance, and how much she had been called upon to endure since then—but the last tones of scorn roused her as she had not been roused before. She answered Mrs. Marks's looks, therefore, by a few haughty words.

"Mrs. Gordon is perfectly right," she said. "My connection with Mr. St. John does not concern her in the least. I decline to explain it in her presence."

Mrs. Gordon showed her appreciation of this reply with admirable temper and dignity.

"Miss Tresham reminds me that I have not yet said good-morning," she remarked. "Will you allow me to say it at once, and to add that I shall be glad to see you at Morton House?"

She shook hands cordially with Mrs. Marks, bowed distantly to Katharine, and left the room. Mrs. Marks followed her, and, during the few minutes which ensued, St. John was able to say:

"Was there ever any thing as unlucky as that she should have found me here? If you had gone with her, you could have discovered every thing."

"You have only yourself to thank that she found you here," Katharine answered. "But, so far as I am concerned, it does not matter—I should not have gone with her."

"Why not?"

"You know why not, St. John. I should only have laid myself

open to the imputation of doing what you wish me to do, of being what you wish me to be—that is, a spy.”

At this point, Mrs. Marks came back through the passage—having parted with Mrs. Gordon on the front piazza. She saw the dining-room door still open, and hesitated a moment. Evidently curiosity said, “Enter;” evidently, also, discretion said, “Pass on;” and, between the two, she stood irresolute. Seeing her irresolution, St. John astonished Katharine by stepping forward.

“Will you come in, madam?” he asked. “In my own defence, and that of Miss Tresham, I should like to say a few words to you.”

Mrs. Marks came in—nowise loath—but Katharine hardly saw her. It was now her turn to feel faint and sick—for the room to go round in a sort of black mist. Through this mist, she heard St. John speak as if he had been a great way off.

“Since you know Mrs. Gordon, madam, you must be aware that she is of a very excitable and impulsive disposition. This fact will account for her unprovoked attack on Miss Tresham and on myself. I came to this place in ignorance of her being here; but, as a friend of her husband, I could not conceal from him that the wife for whom he has been searching all over Europe is in America. One does not expect reason from an angry woman; but you heard how unjustly she assailed me, on account of this act of disinterested friendship. As for Miss Tresham, I will not insult her by offering to—”

“But is it really true?” asked Mrs. Marks, mercilessly interrupting this flow of language. “Is there really no doubt that Mrs. Gordon has a husband living? I—that is, we thought her a widow.”

“There is no doubt, madam, that her husband is living, and that she left him in the most—”

Here Katharine rose and came forward.

“St. John, that is enough,” she said. “Mrs. Gordon’s domestic troubles do not interest Mrs. Marks. Will you go now? I do not think I can stand this any longer.”

She spoke quietly, but with a certain determination which, almost against his will, St. John obeyed. He started, looked at her face, and, seeing the resolution of the eyes that met his own, went to the mantel-piece for the hat he had left there.

“I will go, certainly,” he said; “but I must see you again. When can that be?”

“I don’t know,” she answered, wearily. “I shall begin teaching on Monday, and—”

“I should like to see you before Monday.”

“Come when you choose, then—that is, if Mrs. Marks does not object.”

“Certainly not,” said Mrs. Marks. “I am always glad for any of Miss Katharine’s friends to come to see her, and if Mr.”—she stopped and looked at Katharine.

“Mr. St. John,” said Katharine, in reply to the look.

“If Mr. St. John will come to tea this evening, we shall be very glad to see him.”

“Thank you, madam,” said Mr. St. John, speaking for himself. “I am very grateful for your kind invitation, but I regret to say that I am unable to accept it. I have business-letters of importance to write to-day, and I do not think I shall be able to finish them in time to do myself the pleasure of coming.”

“To-morrow evening—” began hospitable Mrs. Marks; but St. John had already turned away, and was speaking to Katharine in a tone too low for her to hear his words. As Miss Tresham replied, the coldness of her manner struck Mrs. Marks so much that she stopped short in her second invitation. She had supposed that this handsome gentleman must be a favored suitor, but now she began to change her mind. He was a lover.—Oh, dear! evidently a lover, or he would never have spoken in that voice, and with that manner—but a rejected, perhaps a hopeless lover, poor fellow! His devotion touched her, but she was too close an observer not to see at once that his cause was doomed to failure. Men are sometimes deceived by the coldness of a woman, are sometimes unable to tell whether this coldness is that which betrays dislike, or that which conceals love; but you never find another woman who is so blind. Mrs. Marks saw at once that there was no hope for Mr. St. John; and, although she felt sorry for him, although she would have liked to do something to console him, still she had sufficient discretion to feel that the invitation to tea had better not be pressed. When he took leave, she threw a good deal of respectful sympathy into her manner; and, after he was gone, she would have opened fire at

once on Katharine, if Katharine had not anticipated any address on her part, by coming and putting her arms around her.

“You are very good to me,” she said, simply. “I am very glad you did not let Mrs. Gordon prejudice you against me. But do not ask Mr. St. John here again, Mrs. Marks. I do not think Mr. Warwick would like it.”

“I hope I’m mistress in my own house, my dear,” said Mrs. Marks, a little stiffly. Then she softened, and kissed the girl. “I won’t, of course, if you say not—it was only because he was a friend of yours that I asked him. I can see that he cares a great deal for you, and that he hasn’t much in the way of hope to thank you for. But I don’t see what John has to do with it.”

“Mr. Warwick is Mrs. Gordon’s friend, and, naturally, he will take her side, and look on her cause as—as she does. I don’t mean to defend Mr. St. John,” she went on, hurriedly. “I don’t mean that they may not be right; but still, I should like to see him sometimes, as long as he stays here, if you don’t object.”

“My dear, I don’t object in the least,” said the elder woman, kindly. “Don’t be afraid of my being prejudiced by Pauline Morton. I know how quick and fiery she always used to be. As for you, I would trust you with—with a mint of money, if I had it.”

“You have trusted me with the children, and they are worth ten mints of money,” said Katharine, smiling faintly. Then she disengaged herself, and went up-stairs.

An hour or two afterward, Mrs. Marks was in the dining-room, where Tom was busy setting the table, when she was startled by the appearance of Miss Tresham, who entered all cloaked and bonneted as if for a journey, and with a small travelling-bag on her arm.

“Mrs. Marks,” she said, “will you lend me a little money?—ten dollars will do. I find I have none in my purse, and I want to catch the coach, and go over to Saxford. I cannot be back until Monday evening, and that will prevent my beginning school until Tuesday; but I hope you won’t mind it.”

“No—I won’t mind it,” said Mrs. Marks, a little taken aback. She thought Miss Tresham was growing very eccentric, for she had been to Saxford only the week before Christmas, and now to go again so soon, was quite unprecedented and singular, to say the least. She did not think of refusing her consent, however; but, on the contrary, searched diligently for her purse in the depths of a capacious pocket.

“It’s late to be thinking of going, Miss Katharine,” she said. “The stage is due for dinner, you know; and I’m afraid you’ll hardly catch it now. Give Tom your bag, and he can put some ham and biscuit in it, for you won’t be able to stay for dinner. Will two five-dollar notes do? I haven’t a ten.”

“Two five-dollar notes will do very well,” said Katharine. “Thank you, and good-by. Kiss the children for me—I really have not time to see them. That will do, Tom—give me my bag now.”

She took the bag, kissed Mrs. Marks, and was out of the door before that astonished woman had time to collect her senses. When she did, her first exclamation was:

“What will Richard say?”

[TO BE CONTINUED.]

JEAN BEAUVAIS.

JEAN BEAUVAIS paced up and down his apartment with a troubled and unsatisfied air, too feverish to seek repose, although the night was far advanced, and ruminating bitterly over the difficulties of his position, which were far from being sentimental.

The only son of a well-known and highly-respected shipping-merchant of Havre, who died some years previously, from whom he inherited a prosperous business and abundant means, but neither his caution nor sagacity, he had made, on his own account, so many rash and unsuccessful ventures, that his wealth had dwindled down to insignificance—his credit, once so good, being completely shaken. The winter then ending had to him been a long series of misfortunes: twice he had risked largely on two Liverpool blockade-runners, celebrated for their successful trips to Southern ports, which were both taken by the Northern cruisers; two of his ships, richly freighted from Brazil, perished in the Bay of Biscay, uninsured; his cotton speculations, entered into just at the close of the American War, resulted in a heavy loss, and a number of his oldest customers, unable to withstand the pressure of those difficult times, were forced to suspend their payments.

Reviewing his state of affairs from every point of view, he despaired of weathering the storm, and saw clearly that he would have to succumb.

Looking out of the windows of the comfortable mansion, built with the honest earnings of his thrifty father, in a picturesque spot of the banks of the Seine, between Rouen and Havre, it wrung his heart to think that he must part with the home of his childhood, and that his old mother would suffer through his imprudence.

"There is no help for it now," he ejaculated, "and the day of humiliation for us cannot long be delayed." As he gazed out in the clear moonlight, recognizing every well-known feature of the landscape, he thought the scenery around him never looked so fair.

On the morrow, he fully acquainted his mother of the ruinous state of his affairs, expressing his regret and remorse for the rashness and folly of which he had been guilty.

The old lady was grieved beyond expression to hear such a report, for she was proud of the prosperity created by her lamented husband.

"My boy," she said, "do what is right, place every thing you possess in the hands of your creditors, keep nothing back from them; with the wreck of your fortune you may perhaps have enough left to begin life anew, in an humbler way, and in a better spirit. As for me, I will retire to Rouen, where I have means of my own sufficient to keep me in comfort."

Next week, the commercial circles of Havre were discussing the failure of the old-established house of Jean Beauvais, and criticising the foolhardiness of the son, who had reduced to nothing the fruit of his father's labors.

But one opinion, however, reigned among the creditors regarding the upright and honorable conduct of Jean Beauvais. He laid before them a true statement of his position, placed houses, lands, shipping, and every thing he possessed, down to his gold watch and chain, at their disposal. After thorough examination, it was found that the assets amounted to sixty per cent. of the liabilities. Jean gave them every assistance in realizing the value of the assets, and promised to pay the forty per cent. of deficit if more successful next start in life.

On the last evening he spent in the old mansion, he wrote the following note to Elise Desiré, to whom he was betrothed:

"MY DEAR ELISE: I deeply regret informing you that, through losses in business, I am completely insolvent, and will to-morrow be obliged to suspend payments. Little or nothing will be saved from the wreck; as you never possibly contemplated such an emergency, and as I could not consent to make you a partner of my adversity, I in sorrow and sadness release you from the engagement you contracted with me.

"Intending soon to leave Havre, I only add farewell, Elise, and God bless you!

"Yours sincerely,
"JEAN BEAUVAIS."

The parents of Elise sympathized with Jean in his misfortunes, and considered he had acted wisely; in their hearts they were glad that the sacrifice on his part was voluntary, which left their daughter free, and they congratulated themselves that his break-down occurred then instead of six months later.

Elise, however, refused to listen to the voice of reason and entreaty. She had set her heart upon Jean, and his generous renunciation of her hand made her all the more determined to hold him to his promise. Early next morning, Elise and her maiden aunt wended their way up the hill toward Bellevue House, where they found him jaded and downcast.

"Jean," she said, "I am sorry for many things, but will never consent to be parted from you. You have no reason to despair of the future because you are at present under a cloud; in the patient and courageous discharge of fresh duties, you will emerge from it perhaps happier than ever. I am not afraid of a few privations, which, after all, do not signify much, and will wait for you until you are ready."

A flush of pleasure swept over the countenance of the graceful girl, as she witnessed the strong man's concealed emotion and felt the pressure of his gratitude.

"Be it so," he said; "knowing you preserve a warm corner in your heart for me, I will do wonders, and with God's blessing every thing yet may come right." With this understanding they parted, each feeling better and stronger after the renewal of the compact.

Meanwhile, Jean Beauvais's liquidation rapidly continued: his splendid mansion, elegant furniture, carriages, horses, lands, pleasure-yacht,

and shipping, so many tokens of former opulence, were sold and transferred to others; his accounts, balanced by experts, resulting in the loss referred to, he keenly felt the insufficiency of his narrowed resources, and looked forward to the future with anxiety.

On taking a last survey of all that was so recently his own, he inwardly cursed his rashness and folly.

His domestic pets never seemed so attached to him as at that moment, and, while he tenderly patted the arched neck of his favorite riding-horse, it seemed more than usually overjoyed by his caresses. Unavailing regrets, fears, and hopes, alternately chilled and fired his bosom as he turned his back upon the home of his youth and the scenes of his early associations.

Promenading leisurely through one of the leading thoroughfares of Havre, he was saluted and accosted by his friend Franck Renard. "You are just the very man I wanted to see, Jean, so come along with me," and they proceeded arm in arm to one of the principal *cafés* in the vicinity.

"Now, Jean, I'll tell you what it is. I have a clipper of a thousand tons' burden lying in dock, ready to start for Brazil, without a captain, and would be delighted to give you an opportunity of displaying your nautical skill. You took your own yacht round the world two years ago, manœuvring her to the admiration of the old picked salts you had on board, and nothing that I know prevents you from assuming the command of my Jeanne d'Arc, now fully manned and officered, ready to proceed on her voyage. Take charge of her, my boy, and I'll give you two thousand dollars a year and ten per cent. of the net profits."

Jean Beauvais, who had always a strong passion for the sea, and felt conscious of his fitness to undertake the duties required, readily assented to the proposal of his friend, and expressed his gratitude for the preferment.

Duly installed in his quarters in the Jeanne d'Arc, he set about mastering the details of his new position. While overhauling the consignments for the agents of Franck Renard at Rio de Janeiro and Buenos Ayres, his mercantile experience showed him that two important articles might be added with advantage, that would sell easily during the hot season at the Antipodes—from November to the end of January—viz., the light muslins of Mulhouse and refreshing Strasbourg beer.

Having completed his cargo with twenty cases of the former and twenty casks of the latter, and bidden adieu to his mother and betrothed, he set sail from Havre one fine September morning, *en route* for Rio Janeiro, accompanied by the best wishes of his friends and relatives. The rough Norman and Breton seamen sailing under him soon discovered that much kindly interest in their welfare lurked beneath the stern discipline he maintained.

The good ship, with every sail unfurled, sped prosperously on her way, and in the course of a month reached her desired haven.

Having discharged freight and disposed of consignments in both Rio de Janeiro and Buenos Ayres to his entire satisfaction, he then prepared freighting his ship for the return home with wool, skins, hides, horns, tallow, rice, coffee, cotton, etc.

On completing his cargo he again steered homeward, and safely reached the port of Havre a few days before Christmas. After delivery of his report regarding his sales and purchases, Franck Renard enthusiastically complimented him upon his magnificent run, which he considered one of the most remunerative ever made. The grief of his old mother was comforted by the cheering narrative of his first trip, and the evidence it afforded of his future prosperity; while the joy of Elise at his success was unbounded. A halo of hope gilded their season of festivities, which softened down the asperities of life and invested the future with visions of delight.

It was, therefore, with tender interest in each other's welfare that they touched their glasses at parting and pledged each other's health and happiness.

The seasons waxed and waned, bringing increasing prosperity in their train to Jean Beauvais; three years elapsed since he assumed command of the gallant bark, which he skilfully guided from port to port.

His good judgment, honestly exercised from the best and purest of motives, his accurate knowledge of general wants, and his well-grounded calculations, insured the success of all his speculations, and rapidly enriched Franck Renard, who never regretted the choice he had made of a captain.

On sea and ashore, in storm and sunshine, the manly form of Jean Beauvais trod with a firm step the path of duty, and never quailed in the presence of danger. He had striven with all his might to attain the object in view, and the hour of reward for his self-sacrifice had sounded.

He placed sufficient funds in his agent's hands to settle the loss of forty per cent. sustained by his creditors, and consoled himself with the reflection that his motto of "honor bright" was worth while defending and preserving.

On a fine spring morning, the sun shone softly through the stained-glass windows of Notre-Dame de Bon Secours at Rouen, upon the kneeling figures of Jean Beauvais and Elise Desiré, in the act of receiving the nuptial benediction in the presence of his mother, Franck Renard, and a small party of friends.

The captain's handsome face, bronzed with exposure to the heat of the tropics, beamed with satisfaction, while Elise, in her whole bearing, was expressive of the triumph of womanly faith and constancy.

From the balcony of her elegant apartment on the sea-shore at Havre, she could see the Jeanne d'Arc proceed on her voyage and disappear in the distant horizon; or she could watch anxiously for the welcome signal announcing her return, the sight of which would gladden her heart and dispel her fears.

Every thing prospered in the hands of Jean Beauvais, and the cup of his earthly bliss was filled to overflowing.

At the end of the year following his marriage with Elise, a succession of storms of appalling duration and fury swept over the North Atlantic, which resulted in the loss of many a gallant ship and crew. The Jeanne d'Arc, homeward bound, was for three days and nights exposed to the violence of a tremendous hurricane. Scudding under bare poles, she was tossed like a nutshell in the seething billows, and driven far out of her course to the southward. The first officer and four men were washed overboard, and the rest reduced almost to helplessness through fatigue and exposure. It needed all the energy of Captain Beauvais to keep them to their post and prevent them from despairing. On the fourth day, however, the storm abated, when they found themselves off the north coast of Spain; the sea here and there was covered with spars, cordage, and floating wreck, and showed where greater misfortunes than theirs had been endured.

On sailing through the Bay of Biscay, they perceived a large East-Indiaman making signals of distress, being apparently in a helpless condition; on exchanging signals, it was found that her rudder was gone and that she had sprung a leak, her hands being completely used up working night and day at the pumps, she was slowly sinking and drifting toward the shore. Captain Beauvais sent twelve men to their assistance, fitted up a temporary rudder, and, after two days of incredible exertions, succeeded in towing her into the port of Brest. The cargo, which was of great value, having been saved, the amount of salvage-money due to the captain and crew of the Jeanne d'Arc was very large, Captain Beauvais's share alone being estimated at fifty thousand dollars. The Jeanne d'Arc, after being ten days overdue, was signalled at Havre to the intense relief of Elise, who had recently given birth to a lively boy.

On reaching home, broken down with fatigue, his heart was overjoyed by the fresh blessings vouchsafed to him by Providence, and tears of gratitude fell upon both mother and child.

No longer exposed to the dangers of the deep, he now shares the responsibilities of full partnership with Franck Renard; a living example of what may be achieved by a noble purpose and an upright fulfilment of the duties of life.

THE KHEDEVE OF EGYPT.

NAPOLEON I., when he made his famous expedition at the close of the last century, found anarchy in Egypt, and left it there; having succeeded only in crushing the power of the Mamelukes, absolute masters of Egypt on his arrival, but only sharing a divided sovereignty after the French invasion had ebbed away. On the ruins of the Mameluke rule, Mehemet Ali, like Napoleon, a soldier of fortune, but a born king and ruler of men, built up his empire, and founded his dynasty, wisely introducing into Egypt not only the elements of European civilization, but European colonists as well, and thus infusing a more lusty life into the effete civilization of the worn-out East. He sowed the seeds of progress and improvement, initiated many and

perfected some of the necessary works himself, but died long before the full harvest could be reaped. The Mahmoudieh Canal, and many other public works, still remain as monuments of his genius—all untutored, but naturally far-grasping and vivid. His death was as dramatic as his life had been. Ill-judged affection, on a daughter's part, administered to the old man a potion, which, it was believed, would restore and invigorate his failing powers, but which affected his brain, and darkened his last days with insanity—sometimes moody, sometimes violent—but incapacitating him from holding the reins of government.

His eldest son, the warrior Ibrahim Pacha, was first regent for two years, and then Abbas Pacha, his grandson, succeeded, after the death of Ibrahim, though Mehemet Ali did not long survive his son.

The succession—following the Turkish rule, as applicable to the sultan—passed successively to the eldest surviving male of the male branch of the family, not from father to son, as in Western nations, and was thus provided for in the firman of succession granted by the sultan to his rebellious vassal, and guaranteed by the European powers, whose intervention alone had prevented Mehemet Ali from retaining Syria, and wresting Constantinople from the grasp of the feeble successor of Othman. Balked of his prey by that intervention, almost in the very hour of his triumph, Mehemet Ali tore out handfuls of his white beard before he signed the treaty which reduced him from a conqueror to a nominal vassal again. But he had no choice, and submitted—only insisting on the quasi-independence of Egypt and the perpetuity of his dynasty as its rulers—terms gladly accorded by the sultan of that day, but most grudgingly acknowledged by his successors, who have ever striven to neutralize and nullify the plain provisions of that firman—which the present sultan has actually set aside—as will be plainly shown.

For the firman of succession, above referred to, grants to Mehemet Ali and his successors in the line of the eldest male of the blood, the perpetual governor-generalship of Egypt, on condition of the payment of an annual tribute of a fixed sum, the furnishing a certain contingent of men to the Turkish army in time of war, and some minor conditions, with a reservation on the part of the sultan that Egypt should not be allowed to form treaties with foreign governments, nor assume the attitude of an independent and separate nationality.

These terms and conditions have proved a fruitful source of profit to successive sultans, and of intrigue to successive viceroys, each trying to modify or alter them for their advantage respectively.

Thus, as early as the time of Abbas Pacha, commenced the collision between the Sublime Porte and its powerful vassal; the one seeking to enlarge, the other to restrict Turkish interference in Egyptian affairs; while, at the same time, the viceroy was intriguing with foreign diplomats to obtain the recognition by their governments of his absolute sovereignty.

To secure the succession for his son, El Hami, Abbas lavished much gold at Constantinople. His "presents" were cheerfully accepted, and his hopes kept up to paying-point always, until both his projects and his life were strangled by the hands of two Mamelukes, sent him by his affectionate aunt, Neglé Aharum—

"To guide his steps, or guard his rest;"

when Said Pacha, the legitimate successor and son of Mehemet, seated himself on the vacant throne. Said, in many traits of character, resembled his great father, and was proud to imitate him—followed up his policy which the more bigoted and ignorant Abbas had reversed, and, during his brief though brilliant reign of eight years, did much to reconstruct and make the new Egypt of to-day. For it was in his time that the European immigration, checked under Abbas, flowed in full tide into Alexandria and Cairo, and the lines of railway and of telegraph were made to penetrate, not only to Cairo and Suez, but even into the remoter regions of Upper Egypt. He encouraged also the introduction of improved machinery, and steam-engines for irrigation and other purposes, and caused the great cities to be supplied with water-works and gas-works on the European model. To his encouragement and aid the Suez Canal owes its origin and successful completion, and his name is commemorated by the grateful engineer, to whom he was a friend as well as a patron, in the name of Port Said, given to the new town created by his genius, which has risen, at his bidding, from the barren sands of the sea-shore, to be a busy port, into and from which pour the products both of the West and of farthest India.

But Said Pacha, like his predecessor, also devoted much time, and wasted much treasure, in attempting to subsidize the Sublime Porte into changing the succession in favor of his son, Toussoun, and also

coquetted much with foreign powers to secure a recognition from them of his independence.

To effect the latter end, he visited in person both England and France, and returned, broken in health and hope, only to die. Before he was in his grave, the strong hand of Ismail Pacha, his nephew, had seized his right, undisputed by any one, although coveted by his brother, Mustapha Fazyl Pacha, who was but a few days his junior only, and his most inveterate and dreaded enemy, then as now. Mustapha Pacha, educated in Europe, and a man of great intelligence and energy of character, had gone to Constantinople in the time of Saïd, obtained influence and high position there, and thwarted all the intrigues of Saïd, as he was now ready to thwart those of Ismail. For its own purposes, the Sublime Porte played into his hands, and kept him as a convenient knight to checkmate the Egyptian king, and still continues to do so, his last post under the Turkish Government being that of Minister of Public Instruction. It is needless to say that Mustapha does not visit Egypt, as it would be "too hot to hold him."

But Ismail Pacha, far richer as well as more astute than his kinsman, at last succeeded in grasping the prize at which his predecessors aimed, although the tenure by which he holds it is very insecure, and his son may find it but a Tantalus-apple after all. Every one familiar with the Egyptian question was surprised, about three years ago, by the telegram which announced the investiture of Ismail Pacha, by the sultan, as "King of Egypt," a statement which, though as inaccurate as telegrams usually are, yet covered a curious change in the policy of the Porte.

The truth, which came limping along slowly after the lie by lighting, proved to be that, through his *great persuasive powers*, Ismail Pacha had succeeded in securing that change in the succession to the throne which Abbas and Saïd had vainly sought to accomplish, the sultan "having been graciously pleased" to nominate his son as his successor, and to elevate him from the rank of governor-general to that of khédive, not "king," but a rank equal to that of grand-vizier.

The wrath and consternation which this *coup* caused in the family, and especially in the breasts of the two next in succession—Mustapha Fazyl, the brother, and Halim, the uncle of the present viceroy—may easily be imagined. But their protests and appeals (if they made any) were unheeded at Constantinople; and the European powers, which had guaranteed the original treaty or agreement with Mehemet Ali, turned an equally deaf ear, and were silent.

But, from the hour of Ismail's apparent triumph, both the pretenders to the succession have been kindly cared for, and provided with high posts at Constantinople; and but a short time since, just before the Suez-Canal celebration, the sultan openly threatened to revoke his firman altering the succession, and even to depose the existing ruler—an exercise of authority for which he had an equal sanction as for his previous proceeding in setting aside a solemn covenant. It cost the khédive a journey to Constantinople, and several millions of money (it is said), to soothe the wounded susceptibilities of his suzerain, who finally did relent, and on that slippery footing the succession stands to-day.

The young crown-prince is a youth now at an English university. His uncles, whose rights have been thus coolly set aside in his favor by the high-contracting powers at Cairo and Constantinople, are both men of mature age, and of marked ability and resolution, and neither of them likely to yield up a throne without a hard fight for it, both having many devoted adherents and partisans both in Egypt and at Constantinople. Mustapha Fazyl has been all his life conversant with public affairs, and Nature has gifted him with high intelligence and great astuteness, improved by foreign travel and intercourse with men of all nationalities. He speaks and writes French like a Frenchman, and his full face, surmounted by a red fez cap, has long been familiar in the Parisian salons, as well as in the cabinets of Europe. Halim Pacha, next him in the order of succession, is a younger son of Mehemet Ali by a Bedouin mother, and shows his origin both in his appearance and his tastes, which appertain to those of the race of Ishmael. His sharp, clear-cut features, spare, sinewy frame, panther-like elasticity of movement, and small, flashing black eyes, keen as those of a falcon, all recall the child of the Desert. He loves, too, all the wild sports of the Bedouins, such as chasing the fleet gazelle over the desert with trained hawks and Syrian greyhounds, and at the horse-play of hurling the *djereed*, or riding, has no superior even among those Eastern Comanches, his kindred. Therefore those wild riders love him as do the higher and lower classes of Egyptians; and, in the

event of an armed contest for the throne, he could summon a swarm of those rough riders of the desert to assist in unseating the son of Ismail. These are contingencies looming in the future, but they must be taken into account clearly to comprehend the actual situation.

But, although the sultan has accorded these great favors to the khédive, so far from making him "King of Egypt," or acknowledging the independence of his realm, he has sought to tighten rather than relax his hold upon that ever-rebellious dependency. The price which Ismail will be made to pay for those concessions never will be fully settled while he lives; for new pretexts for fresh exactions are invented by his needy patron with each successive moon, and his relatives—"a little more than kin," and much "less than kind"—are held, *in terrorem*, over his head all the time. Since the earliest days of the Ottoman dominion in Egypt, the Sublime Porte has ever been sitting astride of poor Egypt's shoulders, even as the Old Man of the Sea on Sinbad's, and just about as pleasantly and profitably to the bearer of the burden.

It has pleased Europe to approve of this equestrianism, and to reseat the Old Man when Sinbad once shook him off. Whether at the collision, which must come after the death of Ismail, between the claimants for his throne, these powers will again interfere, is a question which time only can solve. Without such interference, the chances are that the intrigues of Ismail will finally prove to have borne but Dead-Sea fruit, and the disturbed line of succession be renewed in the persons of either Mustapha or Halim Pacha. In the interval, though not in name, yet in reality, the khédive is truly "every inch a king," in position as well as in power—in possessions which seem boundless; in wealth, which is fabulous; in prosperity, which has bathed him in its sunshine, and smiled upon him as it once did on King Amasis.

In visions of the night the khédive must see the reproachful shade of his great progenitor, who made that compact binding on all his posterity. From his enemy, the Sublime Porte, he could not look for good faith, but surely he had the right to exact it from those of his own blood, and from the children of his warrior-son Ibrahim, who never thwarted or disobeyed him. One of these sons is the present khédive, the patriarchal system of plural wives giving many sons to one household. He was not the eldest son, and owes his elevation to the tragic death of his brother Achmet, who perished in a railway accident in 1858, while on his return from celebrating some viceregal *fête* of Saïd Pacha at Alexandria. A draw-bridge on the line where it crosses the Nile, forty feet above the flood, had been left open, and into the river the cars were precipitated, drowning Achmet—a gross, clumsy man—and several of his household. Halim Pacha was in the same carriage, saw the danger, and, with the instinctive alertness given by his blood and training, threw himself out of the cars into the rushing river beneath, and alone escaped death. Curiously enough, Ismail had been invited, too, to this celebration, but, being on bad terms with his kinsman the reigning viceroy, feigned sickness and did not go—thus probably saving his life, as he, too, would have been in the carriage with his kinsmen.

There were not wanting evil tongues at the time to whisper loudly that the "accident" was a neat contrivance to dispose of the leading claimants to the throne; but the bold, frank character of Saïd acquitted him personally of any complicity in the transaction. Mustapha was absent at the time at Constantinople, so that, even had all the three princes been drowned on that occasion, the survivors' chances would only have been improved by their removal.

The present khédive is certainly a man of progress and the greatest of merchant princes; for such, literally, he is, owning as he does a large proportion of the best cotton and sugar lands in Egypt, and regulating and controlling trade and transit so as to sell his own crops at the best advantage. As the railways and canals are the property of the government, and he is the government, and all the employes made or unmade at his nod, his produce always gets first to market, and is first shipped to Europe. No individual can compete with him, and those who make the attempt are apt to suffer for their presumption. The doctrine of protection finds in him its practical supporter, and he "discriminates" always in his own favor. By this combination of merchant and prince he has amassed, and is still amassing, immense wealth, and, in spite of the perpetual drain from the sultan, is probably to-day one of the richest princes in the world. For he has the large revenues of Egypt to handle as well as those arising from his own vast estates, covering perhaps a fourth of the cultivated

lands of Egypt, acquired by descent or purchase from his less calculating and business-like relatives. Mustapha's whole property he bought out years since at a cost of several millions, and, coveting Ibrahim's, drove him out of Egypt for pretended plots against the government, on his refusal to sell out his patrimony.

Great attention has recently been called to the khédive in the United States by his recent appointment of about twenty American officers to similar grades in his own army, selected indifferently from the line of the Federal and Confederate armies—General Stone being a prominent example of the first, and Generals Loring and Sibley of the latter.

He had intended appointing many more Americans, but the jealousy of the French and other foreign representatives in Egypt, and the protest of the Sublime Porte against it, nipped the project in the bud when it was most promising. The few, who had already gone, remained in Egypt; but numerous others, who had hoped to go, were disappointed.

The reasons which prompted the khédive in the preference of Americans are obvious. In the existing complications between himself and the sultan, and between his son and those whose succession he has obtained, both father and son require of all things a reliable body of officers for the army, men devoted to their persons, and sharing in their fortunes. No European officers can fill these conditions, because their respective nationalities are sure to be enlisted in these complications, and most apt to take the side in opposition to the khédive, the "integrity of the Turkish empire" being one of the traditions of Europe, in its dread of its great bugbear, the Czar of Russia, and the "faith of treaties" guaranteeing the Egyptian succession to the brother, not the son, of Ismail Pacha.

The appointment of these American officers gave such offence and awoke such suspicions at Constantinople, as to imperil the insecure tenure of the khédive's throne once more, as well as to cause a liberal outlay of *bakshish* there, and a promise "not to do so any more."

So a hollow peace has once more been patched up between the impetuous Head of the Faith and his rich vassal, or vizier, to last only until some new move is made by the restless Egyptian, or some pressing want of money on the part of the Turk, when fresh pretexts for royal displeasure will not be hard to find. As to the relative progress and power of the two kingdoms, in every particular except that of magnitude, the parallel is to the advantage of Egypt and the disadvantage of Turkey.

Turkey, as symbolized by the Sublime Porte, the wan shadow of a once mighty power which imperilled the safety and the religion of Europe, for the last twenty years has been making loud professions of civilization and progress, and has put forth sounding manifestoes in the shape of *tanzimat*s and firmans, all of which are actually not worth the parchment on which they were engrossed, but which Europe revolved like savory morsels between its lips.

For, in these proclamations and declarations, the Sublime Porte has

" — Hed like Truth,
Yet still most truly Hed " —

all those reforms being a mere dead letter, and none of the promised rights and privileges accorded in those decrees ever having been practically enforced out of ear-shot of European representatives throughout the Turkish empire.

The Turk loathes and despises the *giaour* and all his ways to-day just as heartily as he did in the days when the Crescent shone above the Cross, even to the walls of Vienna, but he dissimulates, and pretends admiration. The Turkish administration and policy are as traditional and immutable as the religion of Mohammed, and can be altered just as readily. Even as regards material progress, the same truth is evident. Throughout the wide domain of Islam out of Egypt there is but one railway, the short twenty-mile line from Smyrna to Aidin, and the telegraph-wires are invisible. Whereas, in Egypt, progress shows itself everywhere, in the administration, as well as in the gridiron of railways and long lines of telegraph-wires which cover the face of the country, and are being every day extended farther into the interior. In fact, contrasting Young Egypt with Old Turkey is like placing side by side the young and blooming daughter and the withered and decrepit grandame—the one looking brightly and eagerly into the future, the other mournfully muttering and shaking its palsied head over memories of the past.

Even as regards strength, large as Turkey is, and small as Egypt seems, I believe the latter would prove more than a match for the former now as she did in the days when Mehemet Ali and Ibrahim threatened to found an Arab empire on the ruins of the Moslem, and were prevented only from successfully doing so by European armed intervention.

Turkish drill and discipline are as bad as the Turkish exchequer is empty. With raw material in abundance, their army is an undisciplined rabble; and, although nominally the Porte is perpetually buying arms, yet the shameless speculation of its officials seems as great as in more civilized countries; for the arms are never there when wanted.

Even a handful of half-naked, half-starved, and unarmed Greek rebels defied the sultan's armies for more than a year on a small island, where they were isolated from other aid. What, then, could that army effect against so strong and well-appointed a force as that which the khédive could command, well armed and provisioned, and commanded by officers who have learned their bloody business in hard-fought fields where civilized men legally murdered each other!

But will such a trial of strength ever be permitted? Will the infidel ever permit this Kilkenny cat-fight between the hosts of the "true believers," when Arab and Turk shall grapple in fratricidal strife, even as they allow Frank and Prussian to do to-day? It is not probable that such permission will be given, and that Egypt will be allowed to shake off the incubus of Turkey, which drains her coffers and paralyzes her energies. Neither is it probable that the change effected by the present ruler will outlast his life, or that the new order of things he has instituted will be allowed to continue in force after he sleeps with his fathers under the shadow of the ruined palaces of the Mani-luke kings on the verge of the desert, where repose the ashes of the descendants of Mehemet Ali.

The future of Young Egypt to-day is harder to decipher than the hieroglyphics on her oldest monuments, and we can but vaguely guess at it, for, as the connecting link between Europe and Asia, her geographical position, as well as her vast granary in the delta, makes her a shining mark to attract Muscovite as well as European ambition.

The line of Mehemet Ali thus far seems to have been a fated one. Already, within the circle of one generation, four have successively filled his throne, and several have perished by violent deaths, by cord, steel, poison, flood, and fire, and any thing rather than peace and concord now reigns among his living descendants. We have just witnessed what seems the final overthrow and obliteration of a throne and a dynasty greater and stronger than his, accomplished within the short space of a single month—how, then, can we speculate with any confidence on the perpetuation of the dynasty founded in evident imitation of it by the soldier of fortune fitly termed the Napoleon of the East? Time, who has solved us even the riddle of the sphinx, will read us that riddle too.

EDWIN DE LEON.

FAMOUS SIEGES.

ONE of the most remarkable sieges in the second Punic War was that of Saguntum. The first Punic campaign had ended with the Carthaginians surrendering Sicily and Sardinia. The second campaign, commencing 218 B. C., was fought in Spain, where Amilcar, Hannibal's father, had gone, taking with him his boy to teach him hatred against the Romans. Amilcar's successor, Hannibal, at once marched upon the Saguntines (people of Aragon), allies of Rome, and besieged Saguntum. This city, on the site of which, by the river Palancia, Murviedro now stands, was famous for its figs and for the earthenware cups it manufactured. Hannibal, then a mere youth, opposed at home by Hanno and a faction antagonistic to his family, and which accused him of perfidiousness in breaking treaties with the Romans, pushed on the siege with great vigor. He urged his swarthy African soldiers to increase their exertions by himself working in the trenches among them, and by helping forward the mantlets and battering-rams. The defence was stubborn, and stones and arrows were replied to by arrows and stones. After, it is said, eight months' siege, Hannibal demanded cruel terms—the Saguntines were to leave their city to be demolished, surrendering up their arms, and carrying away only two suits of clothing. Many of the citizens, in their despair, finding the walls giving way, now lit a great funeral pile, and,

after burning all their wealth, threw themselves into the flames. While this horrible sacrifice was actually taking place, a tower, which had been much battered, suddenly fell. The Carthaginians instantly stormed in through the breach; and Hannibal, sounding the trumpets for a general assault, carried the city. With the relentless cruelty of those days, he instantly ordered that all Saguntines found in arms should be put to the sword. Most of the inhabitants died fighting, or, barring themselves up in their burning houses with their wives and children, perished in the flames. Hannibal, nevertheless, secured great wealth and many slaves. The money he appropriated to war purposes; the slaves he divided among the soldiers; and the household stuff he sent to Carthage.

Years later, when the Romans girt up their loins to fairly conquer Spain, one of the greatest events that marked the war was the fifteen months' siege of Numantia, an almost impregnable city on the Douro, near the site of the present Soria, in old Castile. This fortress of the hardy Iberians was built on a steep hill, accessible only on one side, surrounded by forests, and partly moated by the Douro and a lesser stream. It had only a garrison of eight thousand fighting men, but these were Spanish veterans, skilled in the use of bow, spear, and sword. Several consuls had attacked Numantia before Q. Pompeius sat down before it with thirty thousand foot and two thousand horse; but disease attacked his army, and he was compelled to offer terms disgraceful to Rome, to which his successor, however, refused to accede. Soon after, another consul all but surrendered to the victorious Numantines his army of twenty thousand men. The Romans, enraged at these repulses, sent out, in 133 B. C., their greatest general, Scipio Africanus, with four thousand volunteers. He found the army discouraged and demoralized, and at once reshaped it with a strong hand. He turned all the sutlers, diviners, and priests, out of the camp; for vice and superstition had tainted the whole force. He then sold all needless wagons and beasts of burden, forbade any soldier more cooking-utensils than a spit and a brass pot, ordered nothing to be eaten but plain roast and boiled, and counselled every one to sleep, as he himself did, on the bare ground. Having thus hardened his army, he trained it by long, toilsome marches, countermarches, trench-digging, and wall-building, and then laid waste all the territory whence the Numantines drew their supplies. With a force of sixty thousand men, and recruited by Jugurtha, from Numidia, with some elephants and light horse, Scipio formed two camps, and sat down for the winter to starve out the stubborn but now straitened enemy. The town was three miles in circumference; round this area Scipio raised six miles of towers and ramparts, so that only the river-side remained open. To stop any divers or boats coming that way with provisions or intelligence, the Romans fastened tree-trunks, spiked with sword and spear blades, to ropes, and let them whirl to and fro in the rapid current, so that to pass them became impossible. The Numantines made several gallant sorties, but hunger now began to strike them down quicker than the Roman sword. They at last grew hopeless, and offered to surrender, but the stern Romans would grant no conditions. The famine grew worse and worse: first, they ate leather and weeds, then rats and vermin, and even human flesh. Again they offered surrender, but claimed a day's respite. On that terrible day the leading men of the place slew themselves. On the third day a starved band of half-dying people came out of the gates. Scipio selected fifty for his triumph, sold the rest for slaves, and levelled the city. Four thousand Spaniards had kept the Roman armies at bay at Numantia for twenty-one years.

One of the greatest steps in that long career of unjust conquest and cruelty, which at last made Rome mistress of the world, was the arduous but successful siege of Carthage, 148 B. C. Blow by blow the dreadful enemies of the African power had cloven their way to their great rival. The third Punic War began by the consuls leaving Rome with eighty thousand foot and four thousand horse, who had stern orders from the senate not to return till they had removed Carthage out of its place. The Africans, tormented by civil war, began by the most degrading concessions. They surrendered five hundred of their noblest youths as hostages, and brought to the Roman camp two hundred thousand suits of armor, vast sheaves of spears and javelins, and two thousand catapults. Still the Romans were unsatisfied. They required the Carthaginians to leave their city for demolition, and to move ten miles inland. This was the last straw; the maddened people rose in despair. They at once released all their slaves and enrolled them as militia. The temples were turned into

workshops, and men and women, old and young, toiled in gangs night and day at the fabrication of arms. Every day there were made one hundred and forty bucklers, three hundred shields, five hundred javelins, and one hundred catapult-darts. The city, situated within a bay and on a peninsula, was twenty-three miles in circuit, and contained seven hundred thousand souls. The peninsula, forty-five miles in compass, was joined by an isthmus, on which stood the citadel, three miles broad. Toward the continent there were three walls, thirty cubits high, defended by towers rising two stories above the walls. Between the towers were barracks for twenty thousand foot, four thousand horse, and three hundred elephants. The two ports, in the inner one of which were the arsenal and the admiral's house, were barred by chains. In their first attack the Romans were too confident and contemptuous. Three times they were driven from the walls, and once their fleet was almost totally destroyed by fire-ships. At last Scipio Æmilianus came and began the cruel work in earnest, first reforming the Roman army, which had become a mere army of prowling and quarrelling foragers. Having at last taken the isthmus, he there pitched his camp, and built a wall before it twelve feet high, to bar out all provisions from the continent. To equally block up the port and stop all food coming by sea, Scipio raised a huge mole at the mouth of the port; but the Carthaginians, full of energy, at once dug out a new passage and launched fifty fresh galleys. Æmilianus, however, soon after destroyed an African army coming to the rescue, and subdued all the neighboring country. In the spring of 145 B. C., Scipio at last struck the wedge home. He stormed a breach near the port, and, forcing his way into the great square, fortified himself there that night. There were three steep streets leading to the citadel to force, and the roofs of the houses lining those approaches were covered by archers and men, who hurled javelins, or threw down tiles and stones. These houses were cleared one by one, a desperate contest taking place on the roofs, till at last Scipio ordered the three streets to be simultaneously set on fire. Wounded men, old women, and children, threw themselves from the roofs, or perished stoically in the flames. The Roman soldiers spent six days and nights in levelling the ruins and burying the dead. Scipio hardly allowed himself time for sleep or refreshment. Polybius describes seeing him seated on a mound, with tears in his crocodile eyes, repeating those lines in the Iliad where Hector foretells the destruction of Troy. Conquerors, however reckless, are apt at times to give way to momentary outbursts of sham pity. Napoleon once wept at seeing a dog howling beside his dead master (one of some forty thousand harmless human beings that day sacrificed to the emperor's insatiable ambition). In later times leaders scarcely less guilty have found comfort for their wounded feelings on such painful occasions in short texts of Scripture and biblical telegrams.

To return to the siege. On the seventh day the citadel surrendered, on condition that the lives of the soldiers were spared. There first, according to Orosius, came out twenty-five thousand wretched women, then thirty thousand half-starved men. The Carthaginian general, Asdrubal, to the indignation of every one, privately surrendered. Nine hundred Roman deserters, hopeless of mercy, shut themselves in a temple of Æsculapius, and then set fire to the building. The Carthaginians who surrendered were sold as slaves, all deserters taken being thrown to the wild beasts of the amphitheatre. Scipio gave the plunder of the unfortunate city to his soldiers, except the gold, the silver, and the offerings in the temples. Thus Carthage fell; but Carthage was soon revenged, if it be true, as some of the Roman historians contend, that from that moment covetousness and luxury began to corrupt the old stoical Roman virtues.

But the siege that seems to epitomize all the horrors of such contests, forming, as it were, the last crowning scene of a nation's tragedy, was the siege of Jerusalem by Titus, A. D. 70. The city then contained, according to Tacitus, six hundred thousand inhabitants. Josephus has well narrated the sufferings of his countrymen, not merely from the Romans, but also from the savage factions of the two rival chiefs, Simon and John—the former of whom held the upper city, the latter the Temple. Their followers tore each other to pieces up to the very moment that the Romans broke through the walls. The mode in which Titus managed this memorable siege furnishes a good example of the manner in which the Romans conducted such operations. His legionaries, having established their camps on Scopus and the Mount of Olives, began to burn the suburbs of Jerusalem, cut down the trees, and raise banks of earth and timber against the

walls. On these works were placed archers and hurlers of javelins, and before them the catapults and balistas that threw darts and huge stones. The Jews replied from the engines which they had taken from Roman detachments, but they used them awkwardly and ineffectually. They, however, were very daring in their sorties, endeavoring to burn the Roman military engines, and the hurdles with which the Roman pioneers covered themselves when at work. The Romans also built towers fifty cubits high, plated with iron, in which they placed archers and slingers, to drive the Jews from the walls. At last, about the fifteenth day of the siege, the greatest of the Roman battering-rams began to shake the outer wall, and the Jews yielded up the first line of defence. Five days after, Titus broke through the second wall, into a place full of narrow braziers', clothiers', and wool-merchants' shops; but the Jews rallying drove out the Romans, who, not having made the breach sufficiently large, were with difficulty rescued by their archers. Four days later, however, Titus retook the second wall, and then waited for famine to do its work within the city. The Jews began now to desert to the enemy in great numbers, and all these wretches the Romans tortured and crucified before the walls (at one time five hundred a day), so that, as Josephus says, "room was wanting for the crosses, and crosses wanting for the bodies."

At this crisis of the siege the Jews, undermining one of the Roman towers, set it on fire, and did their best to destroy all the besiegers' works. Titus now determined to slowly starve out his stubborn enemies, and began to build a wall round the whole city. This wall, with thirteen forts, the Roman soldiers completed in three days. Famine, in the mean time, was ravaging the unhappy city. Whole families perished daily, and the streets were strewn with dead bodies that no one cared to bury. Thieves plundered the half-deserted homes, and murdered any one who showed signs of resistance, or who still lingered in the last agonies of starvation. The dead the Jews threw down from the walls into the valleys below. In the mean time, the Roman soldiers, abundantly supplied with corn from Syria, mocked the starving men on the walls by showing them food. The palm-trees and olive-trees round Jerusalem had been all destroyed, but Titus, sending to the Jordan for timber, again raised banks around the castle of Antonia. Inside the city the seditions grew more violent, the partisans of John and Simon murdering each other daily, and plundering the Temple of the sacred vessels. A rumor spreading in the Roman camp that the Jewish deserters swallowed their money before they left Jerusalem, led to the murder in one night, Josephus says, of nearly two thousand of these unhappy creatures. Again a part of the wall fell before the battering-rams, but only to discover to the Romans a fresh rampart built behind it. In one attack a brave Syrian soldier of the cohorts, with eleven other men, succeeded in reaching the top of the wall, but they were there overpowered by the Jews. A few days after, twelve Roman soldiers scrambled up by night through a breach in the tower of Antonia, killed the guards, and, sounding trumpets, summoned the rest of the army to their aid. The tower once carried, the Romans tried to force their way into the Temple, and a hand-to-hand fight ensued, which terminated in the Romans being driven back to the tower of Antonia. The Jews, now seeing the Temple in danger, and the assault recommencing, set fire to the cloister that joined the Temple and the castle of Antonia, and prepared for a desperate resistance in their last stronghold. In this conflagration, many of the Romans, advancing too eagerly, perished.

During all this fighting, the famine within the city grew worse and worse. The wretched people ate their shoes, belts, and even the leather thongs of their shields. Friends fought for food, and robbers broke into every house where it was known that corn was hidden. Josephus even mentions a well-known case of a woman of wealth from beyond Jordan who ate her own child. The walls of the Temple were so massive as to resist the battering-rams for six days, so Titus at last gave orders to burn down the gates. At last, after a desperate resistance, the Jews were driven into the inner court, and the Temple was set on fire and destroyed, in spite of all the efforts of Titus to save it. When the Jews first saw the flames spring up, Josephus says, they raised a great shout of despair, and sixteen thousand of the defenders perished in the fire. The Romans, in the fury of the assault, burned down the treasury chambers, filled with gold and other riches, and all the cloisters, into which multitudes of Jews had fled, expecting something miraculous, as their false prophet had pre-

dicted. Titus now attacked the upper city, and raised banks against it, at which about forty thousand of the inhabitants deserted to the Roman camp. The final resistance was very feeble, for the Jews were now utterly disheartened. The Romans, once masters of the walls, spread like a deluge over the city, slew all the Jews they met in the narrow lanes, and set fire to the houses. In many of these they found entire families dead of hunger, and these places, in their horror, the soldiers left unplundered. The Romans, having wearied of slaying, Titus gave orders that no Jew, unless found with arms in his hand, should be killed. But some soldiers still went on butchering the old and infirm, and driving the youths and women into the court of the Temple. The males under seventeen were sent to the Egyptian mines; several thousands were given to provincial amphitheatres to fight with the gladiators and wild beasts; but before all could be sent away, eleven thousand of them perished from famine. Altogether, in this cruel siege, there perished eleven hundred thousand Jews. This enormous multitude is accounted for by the fact that, when Titus sat down before Jerusalem, the city was full of people from all parts of Judæa, come up to celebrate the Feast of Unleavened Bread.

Let us go down the ladder of crime a few centuries later, till we find these grand conquerors of the Jews themselves besieged by Alaric and his Goths, 408. As stern and ruthless as Prussians, the Goths at once cut off from Rome the supplies of food, till famine and plague could silently do the work of sword and spear. The rations of bread sank rapidly from three pounds a day to the merest pittance. The rich strove to alleviate the general suffering, but in vain. Some wretches fed, it is said, on the bones of those they murdered, and even mothers destroyed their children and roasted their flesh. Many thousands of the citizens perished, and, the cemeteries being in the possession of the invaders, the bodies remained unburied. The plague broke out, and new forms of death appeared. In vain Tuscan diviners promised to draw lightning from the clouds, and burn the Gothic camp. In vain the Roman ambassadors warned Alaric of the danger of the despair and fury of such a multitude.

The grim chief only smiled, and said: "The thicker the grass the easier it is to mow."

At first, greedy for spoil, and contemptuous of Roman weakness, Alaric demanded all the gold and silver in the city, and all the rich and precious movables. Finally he withdrew his savage troops, on receiving a ransom of five thousand pounds of gold, thirty-six thousand pounds of silver, four thousand silk robes, three thousand pieces of fine scarlet cloth, and three thousand pounds' weight of Indian pepper, then very scarce and dear. Never since Hannibal marched from Capua had Rome been so scared.

That taste of plunder only provoked the Gothic appetite. In 410, Alaric, provoked by some treachery of the emperor, entered Rome at midnight by the Salarian Gate. The Christian Goths respected the churches, but the Huns and the escaped slaves slew and plundered wherever they went. After six days' license they carried off wagon-loads of jewels, robes, and plate.

Attila, the next devastator of Europe, spared Rome, at the intercession of St. Leo, but Genseric, the Vandal, devoted fourteen days to loading his African slaves with the spoils of Jerusalem and the gold and silver of the Cæsars. In 537, the Goths were again swarming round Rome, and the celebrated defence of the city by Belisarius presents many features of interest.

The great general had a circle of twelve miles to defend against one hundred and fifty thousand barbarians. Against these Belisarius had only thirty thousand citizen soldiers, and five thousand of his veterans hardened in the Persian and African wars. On the ramparts, to aid his archers, were the balistas (great cross-bows), that threw arrows, and the onagri, that slung stones, and on the walls of the mole of Hadrian he had piled ancient statues to hurl down at the enemy. The Goths spent eighteen days in preparing their attack, in collecting fascines to fill the ditches, and in making scaling-ladders for the walls. Their four battering-rams, of enormous size, were each worked by fifty men. They had also huge wooden turrets, drawn by oxen, to form movable forts for assailing the walls. The Goths advanced to the attack in seven columns. The archers of Belisarius, at his desire, shot the oxen that drew the towers, and so rendered them for the time useless. The first day of the attack the Goths lost thirty thousand men, and in a sortie the Romans burnt the formidable towers. In subsequent sallies five thousand of the Gothic cavalry perished, and the courage of the citizens

grew with success. Belisarius, first freeing the navigation of the Tiber, now dismissed from the city all the useless mouths—the women, children, and slaves. Active care was taken to encourage the people, and to prevent treachery. Twice every month the officers at the gates were changed, and even the pope himself was sent into exile on suspicion of having corresponded with the Goths. The barbarians were at last worn out. After a siege of one year and nine days, they burnt their tents, and retreated over the Milvian bridge, having lost at least one-third of their host.

Again, in 546, Rome was tormented by its old enemy the Goth. Totila besieged it, and its garrison of three thousand soldiers was powerless to break the blockade. The pope had purchased an ample supply of Sicilian corn, but the avaricious governor seized it, and sold it to the richer citizens. Wheat soon rose to famine prices, and fifty pieces of gold were demanded for an ox. Gradually the people of Rome were reduced to feed on dead horses, dogs, cats, mice, and nettles. Crowds of starving creatures surrounded the palace of the governor, and requested either food or instant death. To these supplicants Bessus replied, with cold cruelty, that it was impossible to feed and unlawful to kill the emperor's subjects. At this a poor man, with five children, threw himself into the Tiber from one of the bridges in the presence of all the people. To the rich Bessus sold permissions to depart, but most of these cowards either expired on the highways, or were cut down by the Gothic cavalry. Belisarius attempting to relieve the city, Totila erected a bridge with towers on the Tiber ninety furlongs below the city, and this bridge was defended by a boom and chains. But Belisarius attacked it with his infantry and two hundred large boats guarded with high bulwarks of loop-holed planks. These boats were led by two immense barges bearing a floating castle higher than the bridge towers, and stored with fire, sulphur, and bitumen. The chains yielded to the impetus of the assaulting vessels; the fire-ships were grappled to the bridge, and one of the towers, containing two hundred Goths, was consumed by the flames. But in spite of this first success the attack failed. Belisarius was not supported by a timely sally, and soon after Rome fell into the hands of Totila. The conqueror demolished one-third of the walls, and threatened to burn and pull down the great monuments of the city, which barbaric resolution he would have carried into effect but for the intercession of Belisarius.

Let us conclude this summary of great sieges by a brief description of that of Constantinople by the Turks in 1453. The Turkish army was estimated at two hundred and fifty-eight thousand men, and their navy amounted to three hundred and twenty sail. Constantinople, a city of between thirteen and sixteen miles in extent, and containing a population of more than one hundred thousand inhabitants, was defended by a scanty garrison of seven or eight hundred soldiers and two thousand Genoese. The Turks boasted some enormous cannon, which, however, could not be fired more than seven times in the day. The sultan's soldiers labored to fill up the ditches with hogs-heads and tree trunks, dug mines, employed battering-rams and catapults to aid their cannon, and reared against the walls wooden turrets with which to scale the ramparts. After many repulses at sea, Mahomet II. transported his fleet by land from the Bosphorus into the upper harbor, and constructed a huge floating battery. The Greeks tried to set this on fire in a nocturnal attack, but their foremost galliots were sunk, and forty young Greek officers were massacred, in retaliation for which cruelty the Greek emperor hung the heads of two hundred and sixty Moslem captives from the walls. The Turks at last ventured on a general assault, and, after a siege of fifty-three days, the city fell into their hands. In the first heat of victory about two thousand Greeks were put to the sword. The body of the last Greek emperor was found under a heap of slain. About sixty thousand of the Greek citizens were sold as slaves, and, what is of more importance, the Byzantine libraries were destroyed or scattered, and one hundred and twenty thousand manuscripts, Gibbon says, at this time disappeared.

ARCTIC EXPLORATIONS.

THE subject of Arctic exploration having been revived with a certainty that an American expedition will sail during the present summer for the purpose of completing our present imperfect knowledge of the polar regions, it seems advisable to review that which already has been done, and also what remains to be accomplished.

In this connection we propose a brief examination into the respective merits of the so-called "Ocean Gate-ways to the Pole."

As Jones's Sound, in about Lat. 76° north, appears to be the present principal objective point or line of search, we will first turn our attention to it. This sound, or strait, was first discovered, or at least made known, by Baffin, in 1616, and named by him after a London alderman who had been one of his chief patrons. Under the supposition that it was a sound of limited extent, no efforts were made for its exploration until the various expeditions, sent in search of Sir John Franklin, sought every possible or impossible route to the west and north.

The merits of Jones's and Smith's Sounds were freely and frequently discussed, both by scientific men and practical seamen, but few of their opinions were favorable to either one of these as a passage to the northwest.

We first find Captain Penny, an Arctic navigator of twenty years' experience, advocating a search through Jones's Sound, because he had "generally found clear water at the mouth of that sound, and there is a probability that an entire passage opens by this route to Wellington Channel." Penny sailed in 1850, and, when he returned the following year, reported that he "was prevented from approaching Jones's Sound by a chain of immense flocs, extending out twenty-five miles from its entrance. The subject of Captain Penny's further explorations, by way of Lancaster Sound, does not come within the limits of this article.

We find next that Captain Lee, an experienced commander, reported his "having mistaken Jones's Sound in thick weather for Lancaster Sound, and sailed up it one hundred miles without meeting with obstructions of any sort."

This statement of Captain Lee requires some careful consideration. In the first place, it does not seem possible that an experienced navigator could make an error of about ninety miles in his latitude, which would be the case had he mistaken Jones's for Lancaster Sound.

Again, had he sailed one hundred miles up Jones's Sound, his longitude would have been about 85° west, almost within sight of Sir Edward Belcher's subsequent discoveries by the way of Wellington Channel, and at least one degree west of Captain Inglefield in 1852.

In the English Admiralty Blue-Book for 1852, it is asserted that Captain Lee was not in Jones's Sound that year, but in a deep inlet from 74° 40', to 75° north; but there is no record on our latest charts of any such inlet between Jones's and Lancaster Sounds, least of all, one through which he could have sailed nearly to Wellington Channel. Moreover, the northern point of the entrance to Lancaster Sound is in about Lat. 74° 40', and it is not probable that at the present day there could be a deep, unknown inlet within the space of the next twenty miles to the northward; that is to Lat. 75°. It may be that Captain Lee actually entered Lancaster Sound, and, supposing himself in error, ran out again, but, whatever or however the case may have been, it will readily be seen that his statements are totally unreliable, and we cannot depend upon them to show that Jones's Sound has ever been navigated.

In 1852, Captain Inglefield entered Jones's Sound, and penetrated it to Long. 84° west, where he found its northern coast-line trending away to north and west; but, thick weather intervening, he gave up further search in that direction, and returned to Baffin's Bay. This is, I believe, the only well-authenticated case of a vessel having entered, or at least sailed, any distance in Jones's Sound.

Sir Edward Belcher, after passing up through Wellington Channel in his search for Sir John Franklin, says (July 26, 1853), "I proceeded to the northeast as far as the connection with Jones's Strait, where I found the sea open." This was in Lat. 76° 31' north, and Long. 90° west, only six degrees (about ninety geographical miles) from the position attained by Inglefield the previous year from the east, and in nearly the same parallel of latitude.

In the following year, Sir Edward continued his explorations in the same direction, and became more fully convinced that he was at the western entrance of Jones's Strait (not sound), a passage leading from Baffin's Bay to Wellington Channel. Admitting this to be the case, we have no positive proof that a passage can be found through Wellington Channel to the hoped-for open Polar Sea. It may be argued that, between the two observed positions of Belcher and Inglefield (almost in sight of each other), a hitherto unknown passage may open to the northward. This is by no means impossible, but one statement made by Belcher would seem to militate strongly against

it. He found the tides setting nearly east and west, with a regular flow, which could scarcely have been the case if there was a tidal influx from the northward breaking into the regular set backward and forward through Jones's Sound or Straits, whichever it may be.

There is one more distinguished Arctic navigator who makes brief reference to Jones's Sound. Captain McClintock, when on his final voyage in search of Sir John Franklin, says (July, 1858), "Jones's Sound appeared to be open, and a slight swell reached us from it, but all along the shore there was a close pack."

It will be seen that while several distinguished Arctic voyagers have advocated the idea of penetrating to the westward through Jones's Sound, only one of them (Inglefield) has ever even partially solved the problem in a practical manner, and he was driven back by adverse weather without being able to complete his work. It is natural, therefore, to suppose that this is not the most practicable route by which to complete our discoveries in the far North.

The different routes by way of Spitzbergen, Behring Strait, and around the northern capes of Europe, have each many powerful advocates, but the best answer to them all is the simple fact that no expedition, north and east, by either of these lines of travel, has much advanced our actual knowledge of the Arctic regions, and, with one exception, none of them have been able to force a passage very far toward the pole. In 1827, Captain Parry reached the latitude of $82^{\circ} 45'$, but this was only accomplished by leaving his ships at Spitzbergen and travelling in open boats. Although he attained the highest well-authenticated latitude of any Arctic navigator, it was impossible for him to force a ship through, and, while dragging his boats over the ice-floes, the current carried the ice south faster than Parry's men could travel north.

During the two hundred and fifty years previous to Parry's voyage, other worthies had endeavored to get north and east by the various passages referred to, but they were all unsuccessful. We have only to mention such names as Hudson, Willoughby, Phipps, Cook, Meares, Vancouver, Barentz, Behring, Wrangel, and Kotzebue, to show that it was no lack in skill, courage, or zeal, that caused so many failures. Many others equally distinguished might be mentioned, but it would only be to record their want of success. It is the same story with them all; stopped either by ice or hitherto unknown lands. It appears to be a well-established fact, however, at the present time, that there is a known body of land to the northward of Behring's Strait which will prove an effectual bar to progress in that direction. There is one thing more which may be mentioned in connection with this portion of our subject: the efforts of nearly all these old navigators were made in the direction of what some modern scientists style the "Thermometric Gate-ways to the Pole." This simple fact would seem to be a sufficient refutation of the new theory. After a careful examination of this latter question, one can scarcely help coinciding with Dr. Hayes when he declares that "there are no thermometric gate-ways to the pole, except those that are made by hard memory and earnest perseverance."

Some old Dutch navigators of the last century claim to have sailed past the parallel of 84° , and thence to, and even beyond, the pole; but we can find no positive proof that any of them ever reached to Lat. 83° , and from this want of proof their statements cannot be received as evidence in favor of the Spitzbergen route.

During the last few years, several expeditions have been sent out by the nations of Northern Europe in the direction of Spitzbergen; but none of them were able to reach the parallel of 82° , even with the aid of steam-power. The German expedition of last year, in endeavoring to find a passage between Spitzbergen and Greenland, had no better success than its predecessors. In fact, it fared worse than many of them; for one vessel was crushed by the ice, and her crew remained eight months drifting about on a floe before they were rescued. The expedition did not reach quite to Lat. 78° , its farther progress being barred by immense fields of ice, so closely impacted that steam was useless either for advance or retreat.

Valuable to science as are the many discoveries made by the way of Spitzbergen, Nova Zembla, and Behring Strait, they have done but little toward solving the great geographical question of an open Polar Sea, or of discovering a gate-way to the pole.

There is one more route to be considered, and, as it appears most feasible of all, the examination of its capabilities has been reserved to the last. Smith's Sound, although the last of the passages to be explored, has many advantages over its competitors. It was almost literally an unknown sea until Inglefield, in 1852, passed by Capes

Alexander and Isabella, and without difficulty reached Lat. $78^{\circ} 35'$ north. From that point, however, he returned south again, and, as has been before noticed, made an effort to get through Jones's Sound.

Subsequent to him, Dr. Kane, in the years 1853-'55, from his winter harbor in Lat. $78^{\circ} 37'$, sent out exploring-parties in various directions, having the advantage of fast ice to travel on, and finally reached the supposed northern point of Greenland in Lat. $80^{\circ} 40'$, at that time the most northerly land ever visited by white men.

Again, Dr. Hayes, in 1860-'61, established his winter-quarters in Lat. $78^{\circ} 18'$, crossed over to Grinnell Land on the ice, and penetrated to Lat. $81^{\circ} 45'$, the farthest land north ever reached by any explorer. Here he found open water, and was compelled to return to his vessel, a small sailing-craft of only one hundred and thirty-three tons. Later in the season, he saw from the summit of Cape Isabella a stretch of open water, extending about fifty miles to the northward along the coast of Grinnell Land, with a probability that it would open still more in the course of the next two months. His vessel, however, had been so crippled by previous contact with the ice that neither his officers nor himself deemed it advisable to venture with her any farther into the pack, though all of them felt certain that, after the ice-foot had melted away, a strong steamer would have found little difficulty in forcing her way through to the open water.

These last two expeditions, whose operations have been so briefly glanced at, would lead us to think that by this route an entrance may be found to the Polynia of the North. The majority of our American navigators favor this line of travel, and it is also indorsed by such men as Admirals Collinson and Back, Captains McClintock, Hamilton, and Osborne, with many others who won their highest honors in the Arctic regions.

Were it not for the main pack in Kennedy Channel, which never entirely breaks up, there would be no trouble in going farther by water than any one has ever yet been by land. The entrance to this channel from Smith's Sound, between Capes Alexander and Isabella, is less than thirty-two geographical miles wide; while the channel itself, opening out to the northward, is of uncertain width, but probably from eighty to one hundred miles at Cape Constitution, its north-eastern limit. The centre of the channel is filled by a solid pack, the accumulation of centuries, which is so protected by the land that wind and sea can only take effect upon its northern and southern edges, breaking off large floes in the summer-time, which are renewed by the frosts of each succeeding winter. This pack, rising and falling with the tide, becomes very much abraded at its sides by contact with the rocks, so that there is always loose ice between it and the land. Late in the season this loose ice either melts away or is ground to pieces, thus leaving an open-shore lead, through which a light-draught vessel may be taken, but not far on the Greenland side, because the coastline, trending away to the eastward, forms a *cul-de-sac*, into which the main body of the pack is pressed by a constant southerly current. This, of course, leaves a wider passage along the shores of Grinnell Land, and consequently it is there that we may expect to attain the long-sought-for passage to the north.

In addition to these physical reasons in favor of Smith's Sound, it has other advantages not to be overlooked, the principal one being that it furnishes means of subsistence to any extent. On the Greenland side, reindeer, rabbits, and foxes, are found in great numbers; eider-ducks, auks, dovekeys, and other aquatic birds, swarm upon the islands and among the rocks; while seal and walrus enough to feed a ship's company for a year may be taken in a single day.

Here a vessel may be left safely moored, while sledge and boat parties carry on their explorations, always sure of a safe retreat with plenty of provisions; and, in case of accident to one's vessel, the nearest Danish settlement, which may easily be reached in the boats, is not more than six hundred miles distant.

These are some of the advantages in favor of Smith's Sound being the most feasible route for penetrating to the open Polar Sea, and we may briefly sum them up as follows:

1. A well-surveyed course to within five hundred miles of the pole.
2. A safe harbor of refuge, with land convenient in case of accident.
3. Hunting-grounds, where a party may subsist for any length of time, and possibly assist in defraying the expenses of the expedition.

One thing is certain: an expedition will soon sail under our national flag, and we will hope that, whatever route is selected, it may be one which will lead to the solution of the vexed question of an "open Polar Sea."

WAITING FOR THE DILIGENCE.
FROM A PAINTING BY J. C. VIERT.

SHOSHONE FALLS, SNAKE RIVER, IDAHO.

SNAKE RIVER, IDAHO.

THERE is no science probably so full of surprises to the student as that of physical geography. With the progress of exploration and discovery, our ideas concerning certain portions of the earth's surface are being modified every day the domain of productiveness

CLIFFS BELOW SHOSHONE FALLS, SNAKE RIVER, IDAHO.

and of possible civilization is in constant extension, and, as the most powerful modern nations are found in those regions which were put down upon ancient maps as "hyperborean," so, in our own day, vast tracts of unexplored country are opening out before us which are surely destined in the future to be the seats of empires populous and powerful as any now known to us. Some such process is now going on with regard to our new Northwest. It is scarcely twenty years since the whole of that immense portion of our national territory west of Lake Superior was marked simply as "the Northwest Territory" upon maps, destitute of mountains, rivers, or other topographical features; and the popular tradition with regard to it had endowed it with all the icy terrors of the frozen zone. Yet, if the half be true which is told by Governor Langford of the wonders of the Yellowstone, by Mr. Wilkeson of Puget Sound, and by those entertaining explorers, Lewis and Clarke, of the whole region, there is certainly to be found in it some of the grandest, most beautiful, and most impressive scenery on the whole continent. The new Pacific Railroad is being carried through this region, and, in a few years, travellers and artists will make the public as familiar with its wonders as they now are with the famous Yosemite. In anticipation of that time, we present the readers of the JOURNAL with two scenes characteristic of the Snake River. This river itself is an illustration of the truth of our remarks. There are few of our readers probably who are at all acquainted with it, and yet it is one of the large rivers of the continent, and forms the main fork of the one great river on our Pacific coast.

The Snake River is known to later geographers as the Lewis, so named from one of the first explorers. It rises in the mountainous region of Southeastern Idaho, and flows northwestward into Washington Territory. It is about nine hundred miles long, from its source to its junction with the Columbia, and, just before it reaches the noble valley of the latter river, it makes a series of very abrupt descents from its elevated channel in the Blue Mountains.

The Shoshone Falls, on this river, are situated about seven miles from Desert Station, on the stage-road from Salt-Lake City to Boise City, and are described as follows by Ross Browne: "The river for many miles, both above and below, passes through a volcanic valley. It has cut a perpendicular canyon through the layers of lava to the depth of about one thousand feet. The canyon is generally about half a mile wide. At the point where the falls are located it is nearly a mile wide. Viewed from below it appears circular, like a vast amphitheatre, with the falls in the centre. The different layers of lava resemble seats in tiers ranged one above another to a height of seven hundred feet above the head of the falls. In the narrowest part the water is two or three hundred yards wide. About four hundred yards above the main falls are five islands, at nearly equal intervals across the river, dividing the stream into six parts. As the water passes between the islands it is precipitated twenty-five or thirty feet. The falls differ essentially from each other in form, affording great variety. Below the islands the water unites and passes in an unbroken sheet over the great fall; the descent is about two hundred feet. The semicircle at the head of the falls is apparently perfect, and the leap as clear as that of Niagara. Enormous clouds of mist and spray arise, variegated with rainbows. At the foot are rushing showers of spray, from under which the water, beaten into foam, dashes furiously away. Occasionally can be seen through the flying mists the immense sheet of water standing out in bold relief from the rocks, showing that with proper appliances it is practicable to go behind, as at Niagara. A few hundred yards farther down the water swings slowly around in a huge whirlpool and then disappears in the black canyon below. The delicate prismatic colors of the rainbow and the graceful evanescent forms of the mist contrast strangely with the iron-black surface, hard outlines, and awful forms of the overhanging basalt. The sound of the rushing waters resembles that of an orchestra, the small falls giving the high notes, and the great falls the bass, producing a combination not possible to obtain from a single undivided current. At Rock-Creek Station, twenty miles distant, it can be heard distinctly—not continuously, but at intervals, like the surf. When the notes strike in unison they can be heard at a greater distance."

SNAKE River, after a long journey, bids a final adieu to the rocks and gorges through which it has been struggling for so many miles, and enters the beautiful valley, watered by four noble rivers, and enclosed on all sides by the Rocky and Blue Mountains, and the Cascades. This valley is one of the most beautiful on the Pacific coast, and, if explorers are to be trusted, on the entire continent.

THE OTHER SIDE.

I'M not a person to read a great deal. Being a hard-working woman, and always was ever since I can remember, it stands to reason that I don't find much time to spend that way. Once in a while, of a Sunday afternoon, when it's not my turn to go out, and the dinner-dishes are washed up, and the kitchen is clean and quiet for an hour or two, I ask the loan of a book or a paper from one of the young ladies. They used to look at me surprised-like, at first, as if it was queer for a person like me to have any inclinations of that sort. But now I mostly get permission to go into the library and find something to suit myself.

There's no lack of books in the library. Shelves all round the room, and full from floor to ceiling; stacks of old magazines and pamphlets, piled up in corners; and newspapers and new magazines lying round everywhere. It amazes me every time I set foot in it, to think how people can spin so much out of their brains; and what a difference there is in people's brains, for that matter.

I don't consider myself a fool, far from it. I know my place, and the duties of my place, and it's no more than the truth, if I do say it myself, that I always use discretion in my work. I don't spoil my bread in the making or the baking, and it takes good sense, I suppose, to be a good cook as well as any thing else. But I do confess it seems like a miracle to me only to think of how those books are made; and more so when I listen to the wonderful sweet sounds that Miss Helen can bring out of the piano, just with a touch or two of her white fingers, or peep over Miss Alice's shoulder, as I did once, and watched her making pictures of trees and blue sky, as like as the real sky itself, with only a few dabs of paint and a bit of a brush.

I couldn't do such things or any thing like them, not if I was to die for it. But then, to be sure, Miss Alice could not "draw" a turkey or stuff a goose any more than I could mix her colors. And I have seen enough to know that, with all the pictures and music in the world, the comfort of the house is spoiled when the cooking is spoiled. So that brings me to the thing I meant to say when I began, which is that servants are human beings as well as masters and mistresses, though some folks don't seem to realize it. I honestly believe that some of the ladies think we are made out of different flesh and blood entirely; and, as to our having hearts and souls like theirs, or any tender and delicate feelings whatever, they would laugh at you if you mentioned it.

One day, though, when I had the privilege of choosing something to read from the library, I carried off a number of APPLETONS' JOURNAL, and in it I came across an article about servants. It wasn't the first article about servants I had seen. Often enough before that I had read in the newspapers how good-for-nothing they were nowadays, and how impudent, and dirty, and dishonest. They wanted double wages for doing half as much work as they used to do; they expected so many privileges and perquisites; they put on such insolent airs; they wasted and destroyed property; they fed "followers" and "cousins" from the pantry; they gave warning if the least fault was found with them; they made slaves of their mistresses, who didn't dare to complain of the hair in the soup or the dust on the sideboard for fear Biddy would leave them in a huff. All that sort of thing, and a great deal more, *all on one side*, I had seen before. For, though I'm not much of a reader, as I said, you can't pick up a paper to light a fire with nowadays but your eyes fall upon something about the servant question. And it's mostly abuse of servants—wholesale abuse, too, if that's not considered too strong an expression.

This article in APPLETONS' JOURNAL was different, though. It began with saying how some ladies had amused themselves over the impertinence of a girl who advertised for a situation, and said that "only ladies of good temper need apply." Then it went on to make some remarks which I can't, of course, pretend to repeat; but, as I understood them, the writer didn't seem to consider it so absurd and impudent as the ladies did for the girl to prefer living with a good-tempered mistress. And I'm free to confess that I don't either.

Not but what it was a pert sort of thing for her to put in the advertisement, I'll allow that. But, when there's so many sharp things said against the girls, it's not surprising if they're smart enough once in a while to answer back. And if the ladies who were so scornful about it had ever tried being servants themselves, maybe they would

understand the difference between a good-tempered mistress and one that was always scolding and fault-finding.

There's two sides to every story, you know, and I suppose it's natural for people to look at their own side most. Being a servant, I stand up for my class, and I don't think our side has been treated fairly. We've been held up to blame and ridicule, and I'm not denying that it's often deserved. I've seen girls in good places who weren't fit to be there, and whose impudent ways and doings couldn't be too much complained of. But it's not just right to paint us all with one brush. I've seen as many good, honest, faithful, patient, hard-working girls as I have of the other sort, and they ought to have the credit that is due them—more especially as they are not the ones that get the best treatment from their employers.

It's odd enough, but somehow it seems to happen very often that these willing, patient sort of girls get the worst homes. They are peaceable and pleasant, and they get imposed upon by everybody. The mistress finds out that they don't fly into a passion for a cross word, and don't mind running up and down stairs, and going errands out of season, and doing two people's work instead of one as a general thing; so she frets and scolds when she feels like it, and gives her orders right and left, and never sees that she is selfish and unreasonable, and never supposes that the girl will get tired of being imposed upon. But after a while she does, because worms will turn, you know, and then if she stands up for herself a bit, what a fuss they make about impertinence and ingratitude, and how it was just what might have been expected, for they were all alike, these servant-girls, and Lord deliver us from the whole race!

I've seen enough of this sort of thing, but it isn't what they tell in the papers. The very same lady who has worried and abused a willing, quiet girl past all patience will put up with all sorts of insolence from one of the high-flying kind. They come with their noses in the air as if the place was beneath them, and put her in dread of offending them right from the first; so she gives in to every thing they say, and then like as not they go off in a tantrum and leave her just when it's most inconvenient to be left. So it's told then what a martyr the lady is to these unprincipled creatures, and how to be a mistress nowadays is only to be the servant of servants. But it's not to be told how she has driven away, by her bad temper and her heartless selfishness, the one who had given her true and faithful service.

I engaged with a gentleman once to go a short distance in the country and cook for his family. I asked him how many miles out of town it was, and he said, "Oh, not so very far, ten or fifteen miles perhaps;" and I could have the privilege of coming to see my friends about once a fortnight. So I went, and, instead of ten or fifteen miles, I found it was thirty, and his house was five miles away from the station. I was engaged to cook, and nothing said about the laundry or the dairy; but I found I was expected to have all the charge of the kitchen, to make bread and pastry, and every thing for a family of twelve (not to speak of visitors, which they always had two or three at a time), to help with the washing and do the best part of the ironing, for the up-stairs girl was called off continually to wait on somebody; to see to the poultry-yard, and feed the fowls, and set the hens, besides taking care of the dairy, and they kept five cows, and making all the butter that was used in the family, and many a pound over to sell. For Mrs. Packer knew the value of a penny better than anybody I've ever come across before or since, and I've seen some tight-fisted people in my time.

She lived in a house big enough for a hotel, and very expensively furnished. There were thousands of dollars spent in laying out the grounds, and their horses and carriages were as fine as money could make 'em. So were the ladies when they came sailing down-stairs, so grand in their silk dresses, to drive to church, or go out making calls.

But see 'em at home, when the only company was some poor relations maybe, and they would have on old washed-out, skimpy, cotton gowns that I would have been ashamed to put on of an afternoon when my work was done. Not to say it ever was done in that house, for I might have worked from sunrise till sunrise again, and even then Mrs. Packer would have found something else for me to do.

She was that sort of a woman that the only pleasure she took in life was in grinding work out of people, and turning a penny round and round till she made it two, and then parading herself in all the finery she could hang on her little body to make a show of her property. She nagged her husband and her children from morning till

night, till she fairly drove her sons out of the house. One of 'em went to California and died there, and she didn't tell people that he was dead because she grudged the expense of buying mourning. I used to pity the young ladies when I heard her sharp tongue berating them; and, as for that poor Maria that did the up-stairs work—well, there never was a nigger down South that was so put upon. The girl didn't get time to breathe or to sleep hardly; for, if she wasn't on the trot, she must sit down to plain sewing, and it was midnight oftener than earlier when she was let to go to bed. Then if she wasn't up at four o'clock in the morning, she was scolded like a pick-pocket, and all for six dollars a month wages.

She told me she had lived there four years, and never been once to the city in that time. As for going out of an evening, it was too far from any place for her to get back in proper time, having to walk both ways; and it was enough to lose anybody their situation if they weren't in the house and the kitchen lights out by ten o'clock.

I says to her then: "If I was you, Maria, I'd lose the situation sooner than I'd stop with people that treated me so."

And she answers: "If it wasn't for one thing I'd leave in a minute. But little Lucy was a baby when I come here, and she's fond of me, and I hate to part with her."

"Then it isn't Pat Huben at all?" says I, laughing.

But I knew that was the real reason all the while. Pat was the gardener, and very sweet indeed on Maria. Sooner than go away from him she was willing to put up with Mrs. Packer and her nagging ways. But for my part I had no such inducement to stay, and I soon made up my mind that I couldn't afford to burn my candle at both ends the way she expected everybody to do.

She never seemed to consider—and for that matter it's very seldom that ladies *do* seem to consider—that servants have nothing but their health and strength to depend upon. They're very careful of their own health, I've noticed. If they sit up late at night for their own amusement, they'll sleep late the next morning, and take their breakfast in bed; if they do a day's shopping, they must lie down and be waited on all the evening; if they have a headache, it's everybody's business to keep the children away, darken the windows, don't let anybody make a noise, whatever you do.

But fancy a servant-girl stopping her work to go and lie down, because she was tired, or her head ached, or her back ached! She is supposed to be made of stuff that never gets tired, and never wears out. "They have no nerves, you know, those great, strong creatures," I heard a lady say once. "They're mere animals, after all, and it's impossible for them to feel and suffer as we do."

The "mere animal" that was particularly referred to was on her knees just then, scouring the oil-cloth in the hall outside the door. It was one of those dreadful hot days last summer, and she had been hard at work ever since sunrise, sweeping and dusting, and scouring, and washing windows, and polishing brasses, until she was ready to faint. If anybody had given her a kind word, only so much as to say "Aren't you tired, Jane? had'n't you better rest a bit now?" it would have heartened her up, if she was a mere animal. But instead of that she only heard what a great strong creature she was, and how she hadn't any nerves, and couldn't be expected to feel the heat as fine ladies do, lying in a shady room on a cool linen covered couch in their white wrappers, and nothing to do but read novels and drink iced claret.

So it was a very great piece of presumption, to be sure, in a mere animal; but then the Bible tells how even the poor ass opened her mouth and spoke when she was pushed too hard. And Jane, she got up off her knees, she did, and walked straight into the room. And the mistress says to her, not understanding, "Have you finished the hall, Jane, and the bath-room? Then you'd better go down-stairs and clean the silver before you set the table for dinner." But Jane answers, quite composed, "I'm not intending to clean the silver at all, ma'am, and you can suit yourself with a new animal as soon as you please, for I'm not meaning to stop in the house any longer."

And she was as good as her word. The family were put to great inconvenience by her leaving, and the ladies couldn't find words that were bad enough to say how wicked and selfish and ungrateful she was. They couldn't see what right she had to take offence. Such airs, you know—so absurd in such a creature to have feelings!

As I was saying about Mrs. Packer, I soon concluded that the work I was expected to do was too much for any one woman, unless she wanted to kill herself. I told her so at the end of a fortnight,

and she was astonished that I could say such a thing. Nowadays, she declared, girls hadn't any conscience at all; they got lazier every year, and she expected pretty soon they'd hire out to sit in the parlor and play the piano. But, all the same, she wasn't willing to let me go, and it ended in her hiring a woman one day in the week, to take the ironing off my hands.

I agreed to stay upon that, and I did stay for six months, and tried to make myself contented. But it's no more than the truth to say they were the worst six months I ever spent in service. It wasn't so much the work, though I was at it early and late, and it kept me up to all I knew to get through with it as it ought to be done. But the mean ways of those people fairly made me sick.

It's a most unbecoming remark, being only a servant, but it's the honest truth, that I felt myself belittled by living with them. I've been about a good deal, and I've seen different sorts of mean people, and different sorts of vulgar people, but I'll say it for Mrs. Packer, that tie 'em all in a bunch, and she could beat the lot at their own tricks. I could tell enough, if it was worth while, to prove every word of it; but I'm only trying to show that it isn't always and only the ladies who have every thing to endure.

They cheated me out of the privilege of going to see my friends, which was clearly agreed to, by only giving me a Sunday afternoon once in a fortnight. And there were no trains on Sunday, so I never laid eyes on one of my own people the whole six months. And when I went away I had to hire a man to take my trunk to the depot. There were six horses on the place; but "harness up a team for that good-for-nothing, ungrateful hussy!" says Mrs. Packer. "There sha'n't a man nor a beast budge off the estate to help her, not if she has to carry her duds on her back."

And she said more words, which, being a respectable woman and not in the habit of using bad language, I would rather not repeat them. It was all in consequence of my leaving, which she considered was a great injury to herself, and most ungrateful of me—as it's generally the case with ladies; though it's not so easy to see why we're expected to be overcome with gratitude, or why, if we get a chance to better ourselves, we shouldn't improve it, and not be looked at as monsters, either.

It's mostly a mere matter of business, to my thinking. If a girl does her honest work, she earns her honest wages, and it's no favor done her. If the mistress isn't satisfied, she doesn't hesitate to send the girl away, particularly if she has a chance to get another that she thinks will suit her better. She don't stop to think if it's "convenient" to the girl, nor how long it may be before she gets another place, nor how much expense she's been at already, with advertising, or going to offices, nor how bad she feels about losing the situation. All that doesn't signify. But if the servant takes the liberty of being discontented, or improves the opportunity of getting a place more to her liking, then it's wickedness and ingratitude.

Of course I'm not meaning to say that a servant has no call to be grateful for real favors and kindness, nor yet that she never gets such. It would ill become me, for I've lived with ladies that were like angels for goodness, and their kindness to me I never did nor never will forget.

I well remember when I was taken down once with a bad fever, and the doctor recommended strong that I should be sent to the hospital, which was twelve dollars a month out of my pocket, and my wages only eight dollars in those days. Plenty of ladies would have been quick enough to take the doctor's advice, and quite right, too, for it was a bad fever, though not to say catching, and likely to be a long spell of it. But my mistress wouldn't hear to such a thing. She had a bed made for me in a room that was a good way from the nursery, and she nursed me herself till I got that bad I needed watchers, and then she hired a woman to take care of me night and day. I was never left alone or neglected for a single minute; with her own hands she would mix my medicines, and give me drink, and bring me little delicate things to eat when I could; and had her own doctor to come to see me twice a day, like any lady in the land.

It was six weeks that I wasn't able to leave my bed, and two more that I wasn't fit to do a hand's turn, though I crept around the house a bit, to get my strength up. And for all that time there was never a dollar of my wages stopped, nor my mistress would never let me pay a cent for the doctor or the nurse, or any of the expense she was put to on my account. It was bad enough, she said, for me to have such a spell of sickness, without having to lose my money, too, and she

could afford it better than I could. She went on to say also, what was very pleasant for me to hear, that a servant who was so good and faithful as I had been in health, had a right to be well taken care of in sickness; and that it was no more than I justly deserved at her hands.

I lived in that house for seven years, and never received so much as the first word of unkindness from one in the family. They didn't consider me as a "mere animal," or a machine to grind out work for them. They took an interest in every thing that concerned me; they liked me to be happy when they were happy, and for every pleasant thing that went on among them I had a share one way or another. If it was Christmas, I had my nice presents, and not a single child forgot me; if it was a party, I was given the chance to help a little, and come in and see the flowers, and the ladies in their pretty dresses; and a tray full of jelly and cream and nice things always went up to the nursery for me. For it wasn't a cook I was in those days. I was nurse to the little Courtlands, and two of them were born while I lived there, and two I laid out with my own hands; and many a tear I shed over them, my pretty little lambs.

It was the first trouble that ever came to the family, and they felt it sore. Their mother was heart-broken, and no wonder; for two sweeter children, nor prettier, nor better dispositioned, you'd not find the wide world over. It was like parting with my own flesh and blood when I saw the two little coffins let down into the grave, with all the beautiful white wreaths and crosses laid on top. And when I went home from the funeral the house was empty-like and desolate. I missed those children to that degree I couldn't eat or sleep, and I fell off in my flesh with grieving after them. If I took it so hard, and only their nurse, it was natural their mother should feel it more, which she did, and pined away till she was like to go into a decline.

Which her husband then, he couldn't stand it to see her fading before his eyes. So he comes home one day, and says he's taken passage for the whole family to go to Europe in the next steamer. And they went, which was how I came to part with the best mistress ever I had. I'd have gone to the end of the world with her if I'd been wanted, but there was no need to take me, for the youngest child was of an age to go to school now. She was to be put at a French boarding-school with her sisters, and Mr. Courtland was to take his wife travelling to divert her mind.

Short as the time was before they went away, there was new situations, and good ones, looked out for all the servants, that we mightn't be put to any loss by the sudden break-up. I went to mine with my trunk just crowded with the presents they gave me, and with such a written recommendation as the lady I went to said, when she read it, if it was to get me a husband instead of a situation, there couldn't any thing more be said in my favor. It's at the bottom of my trunk now, that paper is, folded up very carefully in my best pocket-handkerchief. Inside of it is a soft, yellow curl, twisted together with a brown one; and they were cut off two little heads that are nothing but dust now, yet gold couldn't buy 'em from me.

There's not too many ladies like Mrs. Courtland, I do suppose. That kind isn't to say common. Nor yet is the other kind, like Mrs. Packer, which I should be sorry to think there were many more of the same sort left. Between the two there's a many ladies of kind hearts and pleasant dispositions as any respectable girl might be glad to live with. That I'm free to confess, and I've seen it with my own eyes how patient such has been with the most careless aggravating girls as would break and destroy every month as much as their wages would come to. Greenhorns, too; when they didn't know a living thing, and were enough to try the patience of Job, I've seen 'em took in hand and treated so gently, and trained and taught till they were fit for splendid situations, by ladies who needn't have taken the least concern about it, only through the kindness of their hearts. And often I've been knowing to girls getting their wages in advance for months together, if they were in want of money, and having clothes and provisions given them to help their families when they were poor.

It's far from my intention to be saying that they shouldn't be grateful for such things, and for kindness which I'm not doubting is done frequent. The girl that leaves a place against the wishes of a lady which has been so thoughtful for her, deserves all the hard names she gets, unless it's an uncommon good reason that takes her away. The thing I'm doubting is if girls are apt to leave places where they have fair wages, and no more than fair work, and comfortable board and lodging, and good consideration every way. I've heard say it's a fool

that doesn't know when he's well off; and, though it may be true once in a way that servants throw up a good home for a foolish whim, I'm certain it's more often they leave because the home isn't a good one.

Sometimes it's one thing, and sometimes another. I've been in places where the wages was good, and the work light, but where I was that pinched for food as I was kept cross all the time out of actually hunger. Every thing was measured out in little spoonfuls, so much for a day, and the rest under lock and key, even to the dry bread. It stands to reason no respectable person would wish to be put upon allowance, like a State's-prison convict. And, when it's short allowance at that, she's not justly to be blamed for leaving at the first opportunity.

There's other places where the lodging is not such as a decent person can put up with. I've seen three girls expected to sleep in one bed, and the room not much bigger than a closet, with no place to keep their clothes, and no opportunity to make themselves neat, though they were required to look so all the same. Ladies, who are very particular themselves to have every thing clean and sweet, will be very indifferent about a servant. Any thing is good enough for them, the smallest and meanest room in the house, the old straw mattress, the moth-eaten blankets and ragged quilts, the cracked basin, the pitcher without a handle, the chair without a back.

"It's better than they had in their own country," I've heard ladies say. "They live like pigs there, and see 'em how they huddle together in the miserable tenement-houses here. It's too ridiculous, the airs they put on about having a nice room when they go into service."

And so it is, maybe, for some of 'em, and others again have tidy ways of their own that it wouldn't be ridiculous for a lady to encourage. I couldn't stay in no place, for my part, where I didn't have three things at least in my room. One is an outside window to let in fresh air and sunshine, which I always spread out my bedclothes under it in the morning; another is clean sheets and covers, and, if it's only straw I have to sleep on, I want clean straw; and, lastly, I want the privilege of using as much water and towels as I like, and the chance to use 'em alone.

I've known ladies much surprised at me when I spoke about fresh air and plenty of water. I don't pretend to say that everybody feels just as I do about keeping things wholesome. Some ladies even are none too particular, and more servants. But, where people care about it for themselves, I think they ought to give the girls a fair chance, too. If they had tidy, comfortable rooms to sleep in, with proper conveniences, and were required to keep their rooms always as nice as they found them, it would go a good ways toward making them nice and careful everywhere else, besides keeping many a good girl in a place which now she leaves because she can't stomach the bad air, and the disgraceful old beds and things, not to speak of the unpleasant habits of them as she's expected to room with.

Food and lodging isn't the only reason, either. In some places it's the habits of the family that no girl can stand and keep her health, or her temper, no matter how she's paid. There's a house I could mention where it's seldom that a girl will stay more than two or three months, at the outside. They get the best of treatment, too, in most ways; good wages, good table, nice rooms, and never a cross word. But they never have an hour or a minute they can call their own, to depend upon. The master gets up early, and wants his breakfast all ready, piping hot, the minute he calls for it. The mistress comes down an hour later, or, maybe, two or three—there's no telling when *she* will come. But she wants her breakfast just the same, all ready, piping hot, the minute she calls for it. And, by-and-by, the young ladies come, perhaps later, perhaps earlier; perhaps one at a time, perhaps all three together—there's no counting on *them*, bless their pretty faces!—and they want *their* breakfast, all ready, piping hot, the minute they call for it.

Lunch and dinner are much the same. The ladies go out shopping, promenading, making calls. They come home just as it happens, some early, some late, and the master waits for nobody. *His* dinner must be on the table at six o'clock, no matter when the others dine; and, like as not, it's nine or ten before the rest of the family choose to finish theirs. The meals are never over in that house. They're cooking, and washing dishes, and setting tables, all hours of the day and night. There are no regular times for any thing, any more than in a hotel, and it wears the heart and soul out of a woman trying to keep up to her work with so many hinderances. The end of it is, she

gives up trying, and looks out for another situation. And then they complain what trouble they have with servants, and the more you give them, and the kinder you are to them, the worse they treat you!

Nobody thinks what trouble the servants have, or how many ways they are tried, and aggravated, that they needn't be if only the masters and mistresses had a little more consideration.

Some people talk before servants as if they were dogs or cats—didn't understand or feel what was said about 'em. "Do you suppose there's any servants in heaven?" says a lady once, in my presence.

"Why not?" says another. "It can't be expected that people will be idle in heaven, and those who are servants here will be the same there. It's all they *can* be, of course."

I was wiping up the hearth at their feet, and they didn't regard me no more than they did the back-log to the wood-fire. But it was on the tip of my tongue to ask 'em who made 'em so well acquainted with the mind of the Almighty, and where it was in the Bible that they found out I was to be a servant for ever and ever. I'm free to confess, for one, that I've been so bold as to hope for something different. It may be very presumptuous for such as me to have an opinion about it, but I do think it's only fair to suppose that the good Lord will make up to us in another life for the opportunities that haven't been given us here. It wasn't a beggar that Lazarus was when Abraham carried him in his bosom. And, by the same token, maybe some of us that's servants now will be thought fit to do angels' work when the Lord calls us home. Leastways it's no mortal man or woman, and I don't care what their station is, that's got the right to say we *can't* be any thing better than we are.

I shan't deny that some of us might stand a better chance of getting up higher in heaven, if we did our duty as servants a little more faithful. It's no good claiming more than we've a right to; but what I do say is this, that it's not fair to expect every thing from the servant, and nothing from the mistress. I've seen mothers as couldn't take care of their own children for an hour together without losing their tempers, and scolding and slapping right and left. But, if the nurse that had 'em nagging an' worriting of her all day long was to be seen raising her hand against 'em, or even her tongue, she'd get warning in a hurry.

And I do say it's not right nor reasonable to expect more from a hired servant than you do from your own flesh and blood. Likewise it's not just fair to tell one side of a story over and over again, which it can't be denied as has been done continual—and never give the other side a chance to speak for itself. That's why I've made bold to speak out plain, and I hope I may be allowed a hearing, and no offence taken, nor it won't be considered impertinent of me, being a servant. For it's what I've no desire to be, quite the contrary.

My desires would be to have all servants do their duty honest by their employers; but likewise their employers should do the same by them, which my remarks is intended to show is not always the case. I'm not that conceited as to suppose my remarks will make a change to add, in spite of much to the contrary, that servants may do the same. Leastways what I've said I can prove, and the truth is worth listening to, whoever speaks it.

HANNAH COOK.

SONNET.

THE LIFE-FOREST.

IN spring-time of our youth, Life's purpling shade,
Foliage and fruit do hang so thickly round,
We seem glad tenants of enchanted ground,
O'er which for aye dream-whispering winds have played;
Then summer comes! her full-blown charm is laid
On all the forest-aisles; from bound to bound
Float fairy music and the silvery sound
Of fountains babbling to the golden glade;
Next, a chill breath, the breath of autumn's doom,
Strips the fair woodland branches one by one,
Till the bared landscape broadens to our view;
Behind, black tree-boles blot the twilight blue,
Before, unfoliated, bald of leaf and bloom,
Our pathway darkens toward the darkening sun!

TABLE-TALK.

SEVERAL new plays have been produced in New York within a few months, but neither art nor literature has thereby gained any accessions to do it honor. The American playwrights still persist in heaping together a series of incongruous incidents and impossible characters under the name of plays, and all conception of a high and a true art in dramatic construction seems as remote as ever. Our drama, instead of advancing toward that ideal which some hopeful people have dreamed of, appears steadily to decline, and every new production only adds another stigma to the history of this branch of our literature. It is a settled conviction with the gentlemen who compose these dramas, that only low, vulgar, and sensational material can with any hope of success be employed in the construction of plays, shutting their eyes to the fact that in England a new style of comedy, remarkable for its delicacy and purity, has attained very great success. These gentlemen charge and convict our American audiences of low tastes, without a trial and without a test. Who has offered to our public a play of high tone? Where is there an American drama—comedy or tragedy—of deftly-constructed plot, well-wrought scenes, and happily-conceived characters? Art does not enter into our plays—nor nature, either, for the matter of that. Not one of the native plays, produced in New York during the past winter, has any claim to the attention of enlightened people. The theory of an artistic play does not seem to have entered into the imagination of our authors. Each successive effort of the older men, and each experiment of younger hands, is alike rickety in construction, vulgar in incident, false in local color, and extravagant in character. Vulgarly of scene and character may be explained by the supposition that the author writes under a supposed knowledge of the public taste; but clumsiness is a disadvantage with the rudest of audiences, and defects in this particular cannot so easily be explained away. Our playwrights have clearly shown no skill even in using the detestable material they think so indispensable. The art of play-writing, which is something entirely apart from the tone or moral of a play, is almost unknown. The authors of American plays seem to depend for success upon some one thrilling situation, content if this be only sufficiently striking, to throw the other scenes together in any rude and slovenly fashion. When a new play, well conceived as to story, deftly wrought so as to work up through a succession of scenes, connected in perfect sequence, with ever-increasing interest toward the climax, having a fine and truthful group of characters—when a play, choicely written according to this ideal, produced with suitable care under right conditions and at the right time, acted by actors equal to their parts, shall fail—then we may safely assume that the American public cannot appreciate the higher drama. But, until this test is made, we submit if it be not something of an impertinence for playwrights to declaim against the taste of a public to whose higher instincts they have never appealed?

—Accompanying this number of the JOURNAL, we give an engraving, after a picture by the latest and best of the semi-historic painters who have grown up in Paris under Gérôme. Vibert is the last of the painters of historic incident whose genius may be said to have been fostered under the second empire. He is, now that Zamacois is dead, the only surviving painter of character, of dramatic episodes, at all likely to succeed to Gérôme in the admiration of the most cultivated, and opulent, and intellectual, of his fellow-countrymen who care more for art and sensation than for what is commonly called morals. He has not the range and he does not show the research of Gérôme, but his style is apparently founded on Gérôme's, and is, like it, polished, studied, and without gayety of color or looseness of manipulation. He is not so brilliant a colorist as Zamacois, and has not his satirical genius; but he has deservedly won the right to be mentioned, as he so often is mentioned, with that celebrated Spanish but truly Parisian painter. Vibert seems to be more directly the outcome of art in Paris rather than endowed with gifts which would have made him a painter in any city of the world. He is like a great many Frenchmen who have told anecdotes with the utmost grace and point in expression, who have written fables and memoirs in concise and brilliant phrases, who have been dramatic but not pathetic in rendering character, in depicting situations, in expressing sentiment. Aptitude for the technical, and a nimble wit, make Vibert's works most interesting specimens of painting. A combination of *finesse* and *esprit* has made his art, in spite of corrupt color—the color of an earth-bound, clay-cold nature—attractive, and even fascinating. But a pure and exquisite spirit would not, could not, save in an hour of eclipse, let itself be interpreted by such color as we find in his pictures, which are dull and leaden, yet occasionally gleam with the brilliancy of metals and jewels. But they have nothing of the pure joy and gladness of material things, like the art of Veronese; nothing of the forlorn splendor, as of an exiled soul, like the art of Delacroix; nothing of the bloom and innocence expressed or suggested by the color of the great English colorists, Reynolds and Gainsborough. Vibert's art comes to us from Paris, and it is expressive of the jewelled luxury and the corrupt fascinations of the beautiful in Paris. It places before us the strongest contrasts, accepted immoralities, and ascetic renunciations, and, although apparently an art of picturesque costume rather than of native experience, it is true to the constant facts of the life of Southern Europe, which is a singular mingling of voluptuousness and asceticism. So much in a general way may be said as an approximative expression of the precise nature of the sentiment and purpose of Vibert's work. At this time we recall three of his pictures which were successes—in the saloons of 1867-'69—representative of subjects picturesque in costume and varied in character, such as "The Monk's Temptation," "Marauding Soldiers of the Sixteenth Century," and "Gulliver among the Lilliputians." The painting from which our engraving is copied represents a Spanish group in the diligence court-yard, "une cour

de diligences en Espagne," the original of which is in possession of Mr. Edward Mathers, of this city.

—The elevated railway in Greenwich Street, at one time considered a failure, is now in operation under a new method. Instead of the endless rope, driven by stationary engines placed at regular intervals, which was first employed, the cars are now run by small dummy-engines on the track. The new plan seems to work well. The engines are compact, make but little noise, consume their own smoke, and do not appear to unduly excite the horses in the street below. The speed is about twice as fast as that of the surface street-cars. Elevated railways of this character would be very convenient in our local traffic. The great viaduct road proposed will be useful mainly to people living at remote distances; it will serve to bring the upper part of the island, and the districts beyond, within easy reach of the city, and be of great advantage to localities so near even as those contiguous to the Central Park. But railways like that of Greenwich Street could be made of great use for short distances. They would render it possible to traverse the lower sections of the city much more expeditiously than now, and could be made the means of relieving the overcrowded streets, by withdrawing from them some of the surface-cars. They could be erected without occupying any space now employed, without disturbing the streets, without the necessity of a costly purchase of right of way. In the wide avenues the plan would be very simple. Single columns could be erected in the spaces between the tracks, upon which the rails would rest at a sufficient elevation to permit all vehicles to pass under. The roadway on these avenues between the tracks is rarely used. The travel almost invariably proceeds either on the tracks, or to the right and left of them, and hence the interference with traffic would be too slight to be worth heeding. The apprehended danger from frightened horses would seem, by observation of the travel on the Greenwich-Street road, to be entirely illusive. The track being in the centre of the street, there would be no injury to property that it passes, and no obstruction to the business of the sidewalk, as in the case with the road now in operation. It would seem that we might, by the method suggested, secure a simple, comparatively inexpensive, and very convenient means of travel, such as would greatly abridge the time consumed in getting from one end of the town to the other, which snow in winter, or thronged streets, could not affect, and which, in many ways, would be of great convenience to the public.

—Considerable discussion has been going on in the critical columns of the London press in regard to the propriety of the final scene in a new dramatic version, by Tom Taylor, of the story of Joan of Arc. The actress is tied every night to the stake, with the fagots piled up around her, and flames break out—every thing being done, in fact, to make the scene as realistic as possible. This is pronounced both inartistic and immoral by some of the critics, and disgusting and ridiculous by others. That it is immoral is not so clear. The effect of a scene like this cannot be elevating, and one would suppose not

edifying; but he must hold his morals by a very uncertain tenure who finds them endangered by an exhibition of this character. In artistic, by the strict canons of art, it is; and yet it is not clear where the limits of imitation in art should be drawn. If the scene described be indeed disgusting and ridiculous, then it manifestly transcends the proper boundaries of representation; but the critics are prone to be over-fastidious. The fondness of the modern theatre-goer for the realistic has become proverbial. Mr. Crummles's "real tub" and "real water," absurd as they may seem in the pages of Dickens, are just what every manager is nowadays attempting to realize. We recollect that Wallack once introduced a real pump on the stage, and, when a young woman entered, hung a pail on the spout, and, proceeding to operate the handle, caused a stream of real water to flow into the vessel, a hearty burst of applause rewarded the brilliant stroke of histrionic genius. In the same scene the stage-manager attempted to give additional reality to the scene, by tying a number of live pigeons on a frame covered with a painted rose-vine. No one appeared to notice or care for the incongruity, and the audience enjoyed the fluttering of the pigeons with vast relish. Real fountains, real cascades, real trout-streams, are not uncommon in our stage-furniture. In Chicago a play has recently been acting in which a man is really hanged—on one occasion nearly fatally so. It is only in keeping with the latest ideas of dramatic art that Tom Taylor should give to his audiences real fagots and real fire for the Joan of Arc catastrophe; the critics may mourn, but the enlightened managers claim to understand what best pleases the enlightened public.

—Mr. Peter Cooper estimates that five million dollars are annually distributed for charitable purposes in the city of New York. We presume this estimate refers to the distribution of societies and associations, and does not include the sums given by individuals, of which, indeed, there are no data for estimating. Mr. Cooper is of opinion that the vast sums thus distributed are really productive of more harm than good. Alms-giving seems to create more poverty than it alleviates, and in New York, as it is in London, pauperism more than keeps pace with the efforts to relieve it. Organized methods of distribution induce organized methods of beggary; and the very fact with many men and women that charity stands ready to relieve their wants is sufficient motive for making no effort on their own part to place themselves above want. Mr. Cooper suggests that, instead of the present system of alms-giving, labor-bureaus should be established, where laborers seeking employment and employers seeking labor can be brought together. The only possible means by which poverty can be radically or permanently relieved is by making the poor self-reliant. One great cause of poverty is idleness; another is the absolute need of work. Labor-bureaus would go far to meet the need in the latter case; in the former the more we attempt to do for it the worse we make it. Five millions annually distributed in charity does as much harm as good, says Mr. Cooper; but five millions thus distributed

if utilized as capital would give employment to many thousands of worthy people who otherwise might be in want. All means should be taken to give every willing hand the means of earning its own support—beyond this charity, excepting with the blind, the lame, the incompetent, should attempt but little.

—The *Boston Medical and Surgical Journal* informs us that the essay on the Climate of the United States, by M. Desor, which we copied recently under our scientific head, was translated expressly for its pages by a friend of M. Desor, and complains that we did not give it credit for the translation. To this we reply that we have not seen the *Boston Medical and Surgical Journal* for many years, that we found the translation of Desor in a newspaper, without any indication of its origin, that we did not copy it *verbatim*, as the *Journal* alleges, but modified it considerably, if we recollect rightly, and finally that, if we had known the origin of the translation, we should have given due credit for it.

—We translate the following pleasant passage from a letter from Iceland, published in a recent number of the Copenhagen *Dagbladet*: "After our arrival here, dreadful weather set in, and we had to remain in-doors for three days. Three long, weary days—for we had only a few books with us, not enough for all. Mr. C—, our American companion, was saved from terrible *ennui* by the fortunate circumstance that one of the books was APPLETONS' JOURNAL, a paper published in New York, with pretty engravings, which an English captain had given to Hansen for his son, who is studying English. Mrs. C—, who cannot read Danish, enjoyed that journal exceedingly."

Scientific Notes.

Ape Resemblances to Man.

BY ST. GEORGE MIVART.

THE Zoological Society can hardly fail to derive decided material advantage from the publication of Mr. Darwin's "Descent of Man." It has been said that already there is a perceptible increase in the visitors to the monkey-house, though an early spring has no doubt cooperated with scientific zeal in the promotion of pilgrimages to the Regent's Park, undertaken in the interest of a more than Chinese worship of ancestors. These visits would, perhaps, be considerably increased if it were very widely known that a fine specimen of a closely-related structural ally was there to be seen and heard, and one the resemblance of which to us has, I venture to think, not been generally appreciated sufficiently. I allude to the fine specimen of the Hoolock Gibbon which has been some time at the Gardens, and which appears to rejoice in good health, good temper, and good voice.

Differing so greatly and fundamentally as I do from Mr. Darwin, it is with sincere pleasure that I give my testimony to the correctness of his appreciation of the value and bearing of man's bodily structure on his zoological position. There can, I think, be no doubt that his frame is so closely related to that of the anthropoid division of the Old World apes, that to accord to it the rank of a family is to go to the extreme of maintainable distinction. De-

scending, however, to smaller divisions, it is generally taken for granted that the palm of resemblance to ourselves can be disputed by the Orang (Simia), or by the African genus *Troglodytes* (which includes both the Gorilla and Chimpanzee) alone. The third member, however, of the anthropoid Simian Graces—the genus *Hylobates* (long-armed apes or Gibbons)—has claims to advance for an award in its favor which I am disposed to consider not unworthy of consideration. Assuming, for argument's sake, the truth of Mr. Darwin's hypothesis that man's body was derived by natural generation from some form of ape, it may, I think, possibly be the case that we have in the existing Gibbon the representative of an ancestor more in the direct line than either the Orang or the African forms, and this in spite of the many points in which the Gibbon recedes yet further from human structure. For though it is indisputable that we can enumerate a greater number of points of resemblance between man and Simia or *Troglodytes* than between man and the Gibbons, while it would be easy to draw out a catalogue of details by which the last-named apes differ more from man than do Simia and *Troglodytes*, nevertheless there are certain points in which the Gibbon genus resembles Homo which are striking and perhaps significant. Although the enormous length of the arms disguises the resemblance, yet the proportions of the Gibbon's frame (as in some respects long ago pointed out by Professor Huxley) are singularly human. The length of the leg as compared with the trunk, and the form and proportion of the bony thorax, are points which may be mentioned. Again, a Gibbon (the Siamang) is the only ape which possesses that striking human feature—a true chin. The slight prominence of the nose too is also very remarkable, a point which has not escaped the notice of Mr. Darwin, and is to be seen in the living specimen here referred to. Again, the power, quality, and compass of the voice, are qualities justly dwelt upon by the last-named author; and, finally, the gentle, yet quick and active nature of the Gibbon is eminently noteworthy.

On the other hand the Orang is a very specially organized, quite aberrant beast (as I have elsewhere endeavored to show), and the brain in the genus *Troglodytes* is considered by Gratiolet to indicate altogether other relationships. Now it is not impossible, on the hypothesis assumed, that the Orang, Gorilla, and Chimpanzee, may be types which have really diverged further from that anthropoid root-form which most nearly resembled man than has the Gibbon, and that adaptations to conditions may have superinduced many of those human resemblances which at present characterize them. It seems difficult, certainly, to apply this view to some details, such, e. g., as the vaginal process of the temporal bone on the basis cranii. On the other hand, it is not in the highest but in one of the lowest of the Simiadae that I have found an anchylosed styloid process to be occasionally present.

A very interesting fact is the great Miocene Gibbon of Europe, the *Dryopithecus*, which goes to confirm the view here suggested as to the dignity of *Hylobates*; but of course we can but speculate inconclusively till Paleontology furnishes us with the nearest extinct representatives of the Gorilla, Chimpanzee, and Orang.

To prevent misconception, I may add that, fully recognizing the truth of Mr. Darwin's appreciation of man's zoological position, which I have ever maintained and indeed labored to support, I none the less completely differ from him when I include the total of man's being. So considered, Science convinces me that a

monkey and a mushroom differ less from each other than do a monkey and a man.

At a meeting of the Royal Institution, Dr. Tyndall lectured to a distinguished audience on the color of water, and on the scattering of light in water and in air; and some of the facts which he laid before his hearers were highly curious and interesting. Scattering is the term applied by the professor to the irregular reflection of light from particles of matter suspended in water or in air. The color of sea-water had long interested him; and, having been in the Eclipse Expedition to Oran, he availed himself of the opportunity to make some experiments on the subject; and the result shows that there is almost as much difference in the color and respective purity of different sea-waters as among fresh waters. Between Gibraltar and Spithead, he filled nineteen bottles, at various places, with sea-water. The first three specimens were taken in Gibraltar harbor, about two miles from the land, and are described as green, a clearer green, and light green; and the difference of color is thus accounted for. On examination of the waters after reaching home, the first was thick with suspended matter, the second less thick, and the third still less thick. The green brightened as the suspended matter became less. They now passed suddenly into indigo water; and the water as suddenly increased in purity as the suspended matter became even less. Beyond Tarifa, the water changed to cobalt blue; and this water is distinctly purer than the green. When they got within twelve miles of Cadiz, the color changed to a yellowish green. The water here proved to be thick with suspended matter. But at a point fourteen miles from Cadiz, in the homeward direction, there is again a sudden change from yellow-green to light emerald-green, and with it a corresponding decrease in the quantity of suspended matter. Between Capes St. Mary and St. Vincent, however, the water changes to the deepest indigo; and this, in point of purity, transcends the emerald-green water. And so, through several other changes of shade, until they enter the Bay of Biscay. Here the indigo resumes its sway, and the water is remarkably pure. A second specimen of water, taken from the Bay of Biscay, held in suspension fine particles of a peculiar kind, the size of them being such as to render the water richly iridescent; and it showed itself green, blue, or salmon-color, according to the direction of the line of vision. The last specimens were bottled nearer home—one off the Isle of Wight, the other at Spithead. The sea, at both these places, was green; and both specimens were thick with suspended matter. From suspended matter in sea-water to suspended matter in our common drinking-water, the transition is easy. We are invaded with dirt, not only in the air we breathe, but also in the water we drink. As Professor Tyndall quaintly puts it—"Here, for instance, is a bottle of water, intended to quench the lecturer's thirst, and it would be well for the lecturer not to scrutinize it too closely. In the track of the beam of electric light sent through, it simply reveals itself as dirty water." He then goes on to say that the most careful filtering, even through charcoal or silicated carbon, is useless to intercept the number of particles wholly beyond the range of the microscope. A glass of cold, sparkling water is a luxury on a hot, thirsty day; but, we fear, many of us will be put sadly out of conceit with the filtered draught when we are told that it is next to impossible, by artificial means, to produce a pure water. The purest water that can be obtained is probably from melted ice; but even this,

from contact of the ice with mote-filled air, is not absolutely pure. The water of the Lake of Geneva is, according to the professor, remarkable for its purity.

Foreign Items.

JUSTUS VON LIEBIG again desires not to be addressed on all sorts of chemical subjects by persons with whom he is not acquainted. He says that such correspondence takes away more time from him than he can spare, and that not a few of the letters which he receives from all parts of the world are written by designing persons for the purpose of obtaining from him indorsements of worthless and injurious medicines, articles of food, liquors, etc.

An old lady was recently beheaded at Insterburg, East Prussia. She had murdered her two cousins for the purpose of obtaining their money. Up to the moment when she reached the scaffold she displayed much firmness, but then her courage failed her, and she uttered the most heart-rending screams until the executioner cut off her head.

It now appears that Alexandre Dumas left but one unfinished manuscript—a novel entitled "Anna." His papers, correspondence, etc., are at present examined by Louis Ratisbonne and Pierre Burty, who will publish several volumes of them as soon as times become more settled in Paris.

The Duke of Saxe-Coburg-Gotha is said to have made by successful speculations in real estate in London several hundred thousand dollars. The Grand-duke of Mecklenburg-Strelitz is bankrupt, he having been exceedingly unsuccessful in stock speculations. At one time that prince was the largest holder of American securities in Germany.

The Princess Mathilde Demidoff, Prince Napoleon's sister, applied recently to the Russian Government for permission to reside henceforth in St. Petersburg; but the Minister of the Interior declined complying with her request, it is said, at the instance of the relatives of her deceased husband.

The young widow of Gustave Flourens, the French insurgent leader who was killed by the Versailles troops, and the mother of Auguste Villemot, the celebrated French *feuilletoniste* who committed suicide toward the close of the siege of Paris, are now both inmates of a French lunatic asylum.

Professor Oppolzer, the celebrated Vienna physician, who died a few weeks ago, received at one time a fee of one hundred thousand florins for saving the life of the Emperor Ferdinand of Austria. He was also for nearly twenty years the physician of Prince Clemens de Metternich.

The Princess Salm-Salm, who played a conspicuous part in the last days of the Mexican empire, offers, in the French newspapers, a reward of five thousand francs for the recovery of the remains of her husband, Prince Félix, who was killed at the battle of Gravelotte.

A recent attempt to assassinate King Victor Emmanuel near the villa of his morganatic wife was unsuccessful, the king having had in his breast-pocket at the time a memorandum-book, which the murderer's bullet did not penetrate.

Prince Napoleon inherited from his father King Jerome only about fifty thousand francs,

and received very little from the King of Italy, and yet his fortune is now said to be larger than that of all the other Bonapartes together.

The Bratiano Palace in Venice, the scene of so many tragic occurrences in the middle ages, was sold the other day to an Englishman from Newcastle for the sum of seventy-nine thousand lire.

The Rothschild Brothers in Paris are said to have quarrelled, and their dissensions will probably lead to the dissolution of the celebrated banking-firm at whose head Baron James de Rothschild was for over forty years.

"The Picture" is the title of an Italian novel which has recently been published at Pisa, and which has proved so popular that nineteen editions of it were sold in less than two months.

The governess of the children of the Crown Prince of Prussia is a cousin of young Dortu, who was court-martialed and shot for treason in the year 1849 by the order of the crown prince's father.

The heir-apparent of the Austrian throne is said to be a sort of musical prodigy. The young prince is an excellent violinist, and the celebrated Strauss has agreed to perfect him in his musical studies.

The wine-growers of Western Germany have presented Prince Bismarck with fifty barrels of Johannisberger, and the brewers of Munich have sent him ten barrels of their best Salvator beer.

Prince Charles of Roumania speaks French and German very fluently, but, despite all his efforts, has been unable to master the language of the country over which he rules.

The wife of General Prim died in Madrid of consumption. The fatal progress of her disease was accelerated by grief at her husband's assassination.

Victor Hugo denies, in a card published in the *Gazette de Bruxelles*, that he has written a new novel and offered it for two hundred thousand francs to a publishing-house in Brussels.

Louis Kossuth, the ex-dictator of Hungary, has married again. His wife is the daughter of a wealthy farmer of Lugano, in the Swiss canton of Tessin.

The Russian Government paid last year to indigent Russian authors and *savants* pensions amounting in the aggregate to fifty-one thousand rubles.

M. Furst, of Nordhausen, in Germany, who for many years was the leading publisher of the lowest class of novels in that country, has recently died in that city in great poverty.

No country in the world has, perhaps, as many advertising-agencies as Germany. There are over seven hundred firms engaged in that business.

The aggregate circulation of the literary papers published at Stuttgart, in Wurtemberg, is five hundred and twelve thousand two hundred and ninety-one copies.

Paris has forty-nine female telegraph-operators, Lyons forty-three, Bordeaux seven, and Marseilles eighteen.

The good-will and property of the *Augsburg Universal Gazette* has recently been appraised at one hundred and six thousand florins.

The Prince of Monaco has sold his chateau to an English stock company, which will open there another gambling establishment.

Five hundred thousand volumes of Pierer's German Cyclopædia have been sold since it was first issued.

The King of Bavaria offers two thousand florins for the best essay written on the times of King Louis XIV.

Richard Wagner, the "composer of the future," has written an opera entitled "King David." It has seven acts.

Hamburg has at present twelve daily newspapers, with a circulation together of one hundred and two thousand copies.

The people of Cadiz are collecting money for the purpose of erecting a bronze statue to Christopher Columbus.

The Grand-duke of Baden has purchased the library of Alfred de Musset, noted for its wealth in interesting autograph-volumes.

The widow of Constant, who was Napoleon's *valet de chambre* for so many years, died recently, in her ninetieth year, at Vienna.

Dora d'Istria has a volume on Turkish poetry in press. It is written in Italian, with notes in Turkish and in Greek.

Padua boasts of two learned young ladies who are said to be the best Latin and Greek scholars in that ancient city.

The former Duchess de Morny, who, after the death of the duke, married a grandee of Spain, is dead.

Only five hundred copies of General von Moltke's official history of the war of 1870 will be printed in Berlin.

During the occupation of Versailles Horace Vernet's sketches were all destroyed.

Roumania has but four daily papers.

Miscellany.

American Journalism.

By THE EDITOR OF "THE LEISURE HOUR."

BEFORE saying any thing of the quality of American newspapers, I wish to refer to their quantity. In order to appreciate this, let us bear in mind the extent of journalism in Great Britain, which is far in advance of all other European countries.

At the beginning of this year there were 1,450 newspapers in the United Kingdom; of which, in London, there were published 261; in the provinces, 851; in Wales, 53; in Scotland, 131; in Ireland, 138; in the British Isles, 16.

Of daily newspapers there are 120 in the United Kingdom, of which 88 are in England; 1 in Wales; 11 in Scotland; 19 in Ireland; and 1 in the Channel Islands. Sixty-one are penny, and thirty-four are halfpenny newspapers. In 1866 there were 78, and in 1856 only 35 daily papers.

Now turn to America, with a population not much greater than our own. There are, at least, 5,200 newspapers published in the United States, of which 550 are daily papers. It is difficult to give the exact number, because many spring up and many perish every year; but these numbers are near the truth. New York, city and State, has more than 800, with a population not much greater than that of Scotland,

or at least of Scotland and Wales together, which have only about 180 papers between them. New-York City alone has 32 dailies. Philadelphia has 16, five more than all Scotland. Boston, Chicago, Cincinnati, St. Louis, Baltimore, and several other towns, have more dailies than any three of our greatest English towns.

The growth of the press has exceeded even the rapid increase of population. The first paper was printed at Boston in 1690. Eighty-five years after, in 1775, the number was only 34; in 1800 it had risen to 200; and in 1830 to 1,000.

The circulation of many of these papers is large. Seven of the New-York dailies, known as the "New-York Associated Press," print at least 112,000,000 sheets annually, and the remaining 25 New-York dailies print nearly the same number of copies. There are about 85 newspapers in the Union, exceeding 20,000 each issue, of which 40 are in New York, 13 in Boston, 10 in Philadelphia, 8 in Chicago, and 5 in Cincinnati. About 150 have a circulation above 10,000, and 500 have 5,000 each issue. The average of the whole of the New-England papers may be about 1,000; of the New York and Philadelphia, 750; of the papers of the West and South, 500 and 300 copies.

In a recent work on the "Progress of American Journalism," it is stated that "each of the great daily papers of New York to-day employs more than a hundred men, in different departments, and expends half a million of dollars annually, with less concern to the proprietors than an outlay of one-quarter of that sum would have occasioned in 1840. The editorial corps of the morning papers issued in New York on the first day of the present year numbered at least half a score of persons; the reporters were in equal force; sixty printers and eight or ten pressmen were employed to put in type and to print the contents of each issue of the paper; twenty carriers conveyed the printed sheets to its readers, and a dozen mailing-clerks and book-keepers managed the business-details of each establishment. Editorial salaries now range from twenty-five to sixty dollars a week; reporters receive from twenty to thirty dollars a week; and the gross receipts of a great daily paper for a year often reach the sum of one million dollars, of which an average of one-third is clear profit. These statistics are applicable to four or five of the daily morning journals of New York."

All this implies a vast circulation of intelligence, and of popular enlightenment and education through the press. In this light the matter is viewed by the United States Government, which franks exchanges through the post. The system of exchanging papers is universal. Every editor gets numerous exchanges for copies of his paper, and so the whole country is kept "posted up" in the news of all parts of the Union.

At the same time there are several great centres of newspaper material and commerce. New York, Boston, Philadelphia, Cincinnati, Chicago, San Francisco, and New Orleans, are among the centres of influence, the local papers of the various States and provincial towns distributing the public news from the central newspapers of these great cities. Every town and nearly every village has its newspaper. So that, as to quantity, America is before all the world the land of newspapers; in other words, where there is most free interchange of thought and most influence of public opinion.

But what of the quality of American journalism? I have no hesitation in affirming that, on the whole, it is as high as our own. They have no daily paper like our *Times*, but they have a hundred as good as any of our best

papers, excepting the *Times*. The "levelling-up" effected by education and public opinion, which has raised the mass of the American people above that of England, has also raised the press to a higher average standard. It would be easy to contradict this by citing many examples of coarseness, scurrility, and bad taste, culled from five thousand papers; but the fact remains as to the general high tone, both intellectual and moral, of the American press. I affirm this from personal study of the best journals in the great cities, and comparison of their leading articles with those of our own London and provincial press. I do not deny the too common exhibition of the worst features of journalism, especially in some of the papers which have largest circulation. The leading journals of all the great towns throughout the States are, with few exceptions, marked by high moral tone as well as intellectual ability.

The scientific journals are many of them of a high order, which may also be said of the medical and the legal publications. The literary periodicals are not of the same excellence, five or six magazines at most being worthy of notice; *Harpers's*, *Appleton's Journal*, *Scribner's Monthly*, the *Atlantic Monthly*, and two or three more. For periodicals, as for books, the Americans are still largely dependent on the old country. The *North-American Review* has good reputation, but the *Edinburgh* and the *Quarterly*, and several other British reviews and periodicals, are regularly reprinted in the States. This tacit acknowledgment of deficiency does not, however, apply to theological works. There is the *Bibliotheca Sacra*, of Andover, well known to scholars; and the *Princeton Review*, edited by Dr. Hodge, the oldest quarterly in America, is still the best, and in general articles on history and philosophy, as well as theology, is second to none in Christendom.

The Decline of Parliamentary Talent.

Where are the rising statesmen? The question is serious; for all the men of first-rate ability in the House of Commons were trained in a past generation, and bear the trace of political influences that have now vanished. Mr. Gladstone, Mr. Bright, Mr. Disraeli, Mr. Lowe, and Mr. Forster, are each in his way the equal of the most powerful minds that ever swayed the House. But where are the young men who can take their places? Nay, where are the young men who can fill the position of such debaters as Mr. Horsman? That Mr. Vernon Harcourt is the most eloquent of living orators, and the greatest of living statesmen, he himself is supposed to class with such elementary truths as the law of gravitation; but there is a slight difference of opinion on that point between Mr. Harcourt and the rest of mankind. Mr. Fawcett is painfully well informed, has courage for any thing, and is a good example of the old shrieking Radical, dashed with a cross of the philosophical breed that sprang from the *Westminster Review*. But the England of past days demanded higher qualifications from her statesmen. Mr. Winterbotham has good powers of speech, a capacity for epigram, and the courage to say what he thinks in the most irritating style at his command; and hence he will take a high place below the gangway, unless he shall be too soon tamed into decorous dulness by the taskwork and the traditions of office. Sir Charles Dilke can think independently, and write well. Lord Edmund Fitzmaurice is a clever man, with a turn for polish of style and point of epigram. On the Liberal side of the House, such are the men who most nearly resemble the old scholarly

breed. On the Tory side there are no clever men, with the doubtful exception of Mr. Plunket, who seems to have inherited a share of his grandfather's brilliant eloquence. All the other members of mark in both parties are men of mere detail, who can master a pile of facts in such mechanical fashion as a barrister masters a brief. They can cram themselves with blue-books, and then pour out the stuff in its old raw state, untouched by one ray of genius, by the slightest power of artistic arrangement, by the faintest dye of original thought, or by any trace of capacity for rhetoric. They are emphatically "safe" men, who will make admirable Under-Secretaries of State, and in time, perhaps, develop into such statesmen as Mr. Bruce. From the accession of George III. till a recent day, the House of Commons saw a very different kind of men constantly ready to step into the foremost ranks. The two Foxes, the two Pitts, Grenville, Wyndham, Burke, Sheridan, Barré, Liverpool, Huskisson, Canning, Percival, Grey, Horner, and Peel, represent a crowd of young statesmen who formed an unbroken chain of political intellect. Each link was a brilliant recruit ready to fill up a gap in the Cabinet or to do splendid work in debate. When Mr. Gladstone looks around, he sees abundant power of mastering detail, a prolific readiness to "concentrate political life on the dative case," admirable aptitude for business, and a consummate mastery of the multiplication-table; but he looks in vain for the broad statesmanship or the intellectual brilliancy with which the House of Commons was richly endowed in past days. He surveys only a Sahara of mediocrity.

St. Michael's Cave.

The mouth is about eleven hundred feet above the sea. We zigzagged up to it, and first were led into an aperture in the rock some height above the true entrance of the cave. In this upper cavern we saw some tall and beautiful stalactite pillars. The water drips from the roof charged with bicarbonate of lime. Exposed to the air, the carbonic acid partially escapes, and the simple carbonate of lime, which is hardly at all soluble in water, deposits itself as a solid, forming stalactites and stalagmites. Even the exposure of chalk or limestone water to the open air partially softens it. A specimen of the Redbourne water exposed by Messrs. Graham, Miller, and Hofmann, in a shallow basin, fell from eighteen degrees to nine degrees of hardness. The softening process of Clark is virtually a hastening of the natural process. Here, however, instead of being permitted to evaporate, half the carbonic acid is appropriated by lime; the half thus taken up, as well as the remaining half, being precipitated. The solid precipitate is permitted to sink, and the clear supernatant liquid is limpid soft water. We returned to the real mouth of St. Michael's Cave, which is entered by a wicket. The floor was somewhat muddy, and the roof and walls were wet. Our guide took off his coat, but we did not follow his example. We were soon in the midst of a natural temple, where tall columns sprang complete from floor to roof, while incipient columns were growing to meet each other, upward and downward. The water which trickles from the stalactite, after having in part yielded up its carbonate of lime, falls upon the floor vertically underneath, and there builds the stalagmite. Consequently, the pillars grow from above and below simultaneously along the same vertical. It is easy to distinguish the stalagmitic from the stalactitic portion of the pillars. The former is always divided into short segments by protuberant rings, as if deposited periodically, while the

latter presents a uniform surface. In some cases the points of inverted cones of stalactite rested on the centres of pillars of stalagmite. The process of solidification and the architecture are alike beautiful. We followed our guide through various branches and arms of the cave, climbed and descended steps, halted at the edges of deep, dark shafts and apertures, squeezed ourselves through narrow passages, where the sober gray of my coat suffered less than the black of my companions'. From time to time we halted, while Mr. Crookes illuminated, with ignited magnesium-wire, the roof, columns, dependent spears, and graceful drapery of the stalactite. Once, coming to a magnificent cluster of icicle-like spears, we helped ourselves to specimens. There was some difficulty in detaching the more delicate ones, their fragility was so great. A consciousness of Vandalism which smote me at the time haunts me still; for though our requisitions were moderate, this beauty ought not to be at all invaded. Pendent from the roof in their natural *habitat*, nothing can exceed their delicate beauty; they live, as it were, surrounded by organic connections. In London they are curious, but not beautiful. Of gathered shells, Emerson writes:

"I wiped away the weeds and foam,
And brought my seaborн treasures home;
But the poor, unsightly, noisome things
Had left their beauty on the shore,
With the sun, and the sand, and the wild uproar."

The Management of Children.

There is a tendency, we think, at the present day to put children too forward, not so much for the sake of showing off their extraordinary merits to an admiring world, as from the better motive of early accustoming them to the conversation of grown people and the usages of society, and of inspiring them with confidence, ease, and self-possession. No doubt these results are very valuable; but the mistake which many people make is in forgetting that children are something like dogs, which require to be very well trained before they can safely be recommended to the familiarity of strangers. And it is to be remembered that the moment children cease to respect any of the grown-up people with whom they associate, not only is the whole benefit of the intercourse lost at once, but real injury is inflicted on the moral tone of the child. For this reason children should be brought as little as possible into the society of men and women who cannot command their respect; while of those who can, the influence should be hedged round by all the numerous impalpable barriers which judicious parents know perfectly well how to interpose between children and the most popular and careless of their adult playfellows. The confidence which well-bred children at once repose in an eligible stranger, without being either rude or troublesome, is charming to everybody who has any natural taste for their society.

But closely allied with the mistaken license allowed to children in matters like the above, is the disposition to laugh at, and thereby to encourage, all traits of singularity, oddness, or affectation, which children may exhibit, as marks of genius which ought not to be repressed. Of all the dangerous errors into which parents can fall, this, in our opinion, is the worst. For nothing so soon hardens into second nature as juvenile eccentricity; and few things are more injurious to success in life than marked oddities of manner and gesture when they reach the point of grotesqueness. The majority of the world agree with Mr. Peter Magnus; they don't see the necessity of origi-

nals. And what is more, so many "originals" are only sham ones after all. That is to say, their singularity is merely a bad habit which they can't shake off, and is only very partially innate. When you see a child doing any thing unlike other children, any thing queer, surprising, or uncouth, however comic or however clever it may seem, never laugh at or applaud it. Children naturally very self-willed, and with real natural peculiarities, can soon be broken of such tricks, if treated with absolute indifference. But soon let the idea find its way into their brains that such sallies, naughty though they be, are regarded as marks of genius, and the mischief is done.

To come back to the point from which we started—the management, namely, of young children—there is one thing to be laid down: let there be no divided rule in a house. Don't let the children see that the father means one thing and the mother another in their bringing up. They see the difference, if it exists, in a moment; and when they do, farewell to all wholesome parental influence. Husbands and mothers may talk too freely before their children, forgetful of their rising intelligence. And, indeed, nothing is more common than to get a wink from the head of the house, implying that you are to be upon your guard before Johnny or Tommy, who is listening open-mouthed to your witty narrative, while he himself the next moment will offend against his own precautions in the most barefaced manner by plunging headlong into your domestic controversy, in which, to speak metaphorically, knives are freely used on both sides.

Haggling in the Highlands.

It is odd to notice the style in which the country-folk coming into Stornoway go about their purchases. For instance, a man comes into town to buy a bonnet (a Scotch cap). He goes first to the draper's, and, after lounging about in the shop, looking round, and perhaps offering an occasional remark on the weather and other general subjects, as if he had no intention of making a purchase (for the people consider the space outside the counter to be public property), he at last approaches the business that brought him. He tries on a variety of bonnets, asks the prices, and takes particular note of the bonnets that suit him. He then leaves the shop and proceeds to another draper's, where he goes through the same process; and, having gone round the town in this way, returns to the place where he thinks he will make the best bargain. After a great deal of haggling to bring down the prices, he perhaps makes the purchase; but, if not satisfied, he will go away, to return some other day, and see if he cannot get the article for a penny or a halfpenny less. This style of business is not confined to the Jews. A gentleman connected with the Perth and Inverness Railway told me that, when that line was first opened, some of the natives, wholly unaccustomed to fixed prices, endeavored to deal with the ticket-clerk as they would with a shopkeeper. The following was one of the dialogues that ensued: Countryman—"What is the price to Kingussie?" Ticket-clerk—"Two and eightpence." "Two and eightpence? Hoch, never! I'll give you two shillings." "There is no reduction. The fare is two and eight." "Make it two and tuppence, and it's a bargain." "I tell you the fare is two and eightpence." "It's only a matter of thirty mile." "It doesn't matter what it is. That is the fare." "I'll give you two and threepence." "It won't do." "Two and fourpence, then." "No, nor two and fourpence." At two and sixpence he made a dead stand, and, finding the clerk inexorable,

went away and waited till the next train, when he came back with his offer of the two and sixpence, in hopes of finding the clerk more accommodating.—*Macrae's Home and Abroad.*

How to rule a Husband.

Above all things, if a wife wishes to make home attractive to her mate, let her keep a sharp eye on the cook; nothing makes a male creature more discontented with his house than bad dinners, ill-served; if there is any thing that will make him swear (and there generally is, my dear young lady, although his temper seemed so angelic when he was a-wooing), is a cold plate with hot meat, or a hot one with his cheese. Neglect of this sort is unpardonable. Again, it may not be possible to give him dainties, but it is easy to avoid monotony by a careful study of the cookery-book; and it is quite astonishing how the monster man can be subjugated and assuaged by a judicious variation of his meals. The creature may be allegorically pictured lightly led by a fair lady with a wedding-ring through his palate. Indeed, there are a thousand ways to lead him, if women would show a little tact, with which they are so falsely credited. Opposition, contradiction, makes him furious; he stamps, he roars, and becomes altogether dangerous. Whereas, treat him tenderly, O wife, and you shall wind him round your marriage-finger. I have seen wives miss their chance of gaining what they have set their eyes on a thousand times through sheer stupidity; they know that a certain line of conduct is sure to anger him, and yet they wilfully pursue it, when smooth and easy victory awaits them in another direction. Tact! Such women, I say, have not even instinct. Birds of paradise, for instance (not to be rude), would act in a more sagacious manner.

Varieties.

A NOTHER body has been discovered at Pompeii, and has been added to the five others in the museum. The ingenious system by which Senator Fiorelli is able to reproduce the shape and features of the corpse by the mould of incrustated ashes formed on the body is well known. In the present instance the impression is perfect, and has produced results superior to any yet obtained. The body is apparently that of a plebeian in the prime of life, who had fallen backward while endeavoring to escape. The agony of his death-throes is shown by the contortions of the countenance and the left hand convulsively clinched.

The latest California crop is one of tarantulas. They are raised in Calaveras County, and sold with their marvellous houses to Eastern tourists. Their cells are totally unlike any thing else in Nature; from three to eighteen inches deep, with a water-proof lining, coated over with a substance looking like chamois-skin, but as fine as silk velvet, with a door or lid which they close after them when they go in; and, when they have their young, they latch it, bolt it, and then seal it perfectly watertight. The increase about one hundred and fifty fold annually.

Madame Seebach while in Washington was robbed of some twenty-seven hundred dollars' worth of diamonds and jewelry, including an elegant watch presented to her by the Queen of Holland, worth about sixteen hundred dollars. It was in the form of a beetle, thickly incrustated with diamonds and rubies. Touching one spring caused its wings to open, revealing the dial of the watch, and another spring opened to view a portrait of the donor, with a highly-complimentary inscription.

Of the thirty courses of university lectures at Harvard not more than half a dozen have had a paying audience of half a dozen persons each; while the best attended have had but seventy-five, including professors, undergraduates, etc., who pay no fees. Kant is expound-

ed to a single student, a young lady; and Plato and Juvenal had each the same audience. The entire number attending lectures is about two hundred, including about an equal number of the two sexes.

An old negro made application at one of the public buildings in Washington a short time since for something to eat, and claimed that he had a right to come there for victuals. The head of the department was called in, who asked the darkey upon what right he based his claims. "Why," said the sable representative of the fifteenth amendment, "I understand the provisions in de Constitution for de colored folks, and I haven't had de fust crumb!"

The following programme for the observance of wedding-anniversaries seems to be generally adopted throughout the country: First anniversary, iron; fifth anniversary, wooden; tenth anniversary, tin; fifteenth anniversary, crystal; twentieth anniversary, china; twenty-fifth anniversary, linen; fortieth anniversary, woollen; forty-fifth anniversary, silk; fiftieth anniversary, golden; seventy-fifth anniversary, diamond.

Théophile Gautier, the renowned literary animal-fancier, had at the beginning of the siege of Paris one hundred and fifty cats, and at the capitulation discovered that his feline stock had been reduced to nine, owing to the roving habits which made them a prey to the hungry population. Even of the nine four had their tails shot away. Gautier is sorely troubled over his losses, as his love of cats, he says, passes the love of woman.

The French generals were not much on fighting, but one of them has perpetrated the following very good epigram:

"The cock of glory is the cock Français.
Demoralized he is not by defeat;
He crows right loudly when he wins the day,
And louder yet when he is soundly beat—
His strongest point is to crow away."

The Connecticut mind takes to economy very naturally. An old lady living in the Nutmeg State has tabooed candles and taken to gas on this ground: she says gas is hardly half a cent a foot, while candles are five cents a foot.

Flecher, Bishop of Nismes, was the son of a tallow-chandler. A proud duke once endeavored to mortify the priest by saying at the *Levee* that he smelled tallow; to which the other replied: "My lord, I am the son of a tallow-chandler, 'tis true, and, if your lordship had been the same, you would have remained a tallow-chandler all the days of your life."

The recent explorations in Jerusalem have excited the greatest interest among the masonic fraternity on account of the discovery of what are believed to be "masons' marks" on a considerable number of the immense foundation-stones recently uncovered under the *debris* of the Temple.

The Princess Louise's wedding-cake was three stories high, on a golden stand, and weighed two hundred pounds. It was embellished with royal arms, flowers, fruits, monograms, Cupids, likenesses of Louise and Lorn, roses, shamrocks, thistles, birds, and sundry other things.

One result of the women's movement is the fact that the sex are crowding into branches of industry and labor such as would have shocked the modesty of the girl of ten years ago. Two girls in a small town in Ohio run a blacksmith's shop all by themselves. They dress in Bloomer costume, and shoe a horse just as a man does.

It is related that when Beecher was in the country last summer he lost his hat, and found it, in about a week, in the barn where he had left it, but with four eggs in it. This is as it should be. Beecher had just written a eulogy on the hen; why shouldn't the Hen-reward Beecher?

A gigantic Japanese crab has been placed in the British Museum. The claws are six feet in length. The triangular body is comparatively small.

A Western writer gives it as his belief that if as much attention were paid to improving

corn as is given to grapes, one hundred million bushels might be added to the annual crop.

Baron Nathaniel de Rothschild, who died in Paris last year, left by his will property to the amount of nine million dollars only.

There are six million real-estate owners in the United States, two-thirds of them being farmers.

The religious societies of France are said to be the possessors of property to the amount of one hundred million dollars.

The man who "couldn't find his match" went to bed in the dark.

A man who has tried it says that all the short-cuts to wealth are overcrowded.

In Great Britain tax is paid on over eleven million dogs.

The Museum.

OF the Chinaman's social habits," says the Rev. J. G. Wood, in "The Natural History of Man," "none has been more widely known than the use of the 'chopsticks,' or the two little rods by means of which the solid food is eaten. This is not the Chinese name, but is one invented by foreigners, who have employed the term as a sort of equivalent for the 'kwai-tsze,' or nimble lads, as they are very appropriately termed by the Chinese. Originally they were simply two slips of bamboo, but now they are of wood, bone, ivory, or sometimes silver. Two pairs of chopsticks in my collection are nearly ten inches in length, and about as thick at the base as a small goose-quill, tapering gradually to half the thickness at the tip.

"Much misunderstanding prevails as to the use of the chopsticks, many persons supposing that they are held one in each hand, after the manner of knives and forks in Europe. These curious implements are both held in the right hand after the following manner: One of them is taken much as the pen is held, except that, instead of being held by the thumb and forefinger, it passes between the tips of the second and third fingers. This chopstick is always kept stationary. The second chopstick is held lightly between the thumb and forefinger, and can be worked so as to press with its tip against the point of the other, and act after the manner of pincers.

"The adroitness displayed by the Chinese in the use of these implements is worthy of all admiration. I have seen them pick up single grains of rice with the chopsticks, dip them in soy, and carry them to the mouth with perfect precision; and, indeed, after some few lessons, I could do it tolerably well myself. In eating rice after the usual manner, the tips of the chopsticks are crossed, and the rice lifted with them as if on a spoon. If, however, the man be very hungry, he does not trouble himself about such refinement, but holds the bowl to his lips, and scoops the rice into his mouth with a celerity that must be seen to be believed. In point of speed a spoon would be nothing compared with the chopstick.

"The reader must understand that the Chinese never carve at table, thinking that to do so is an utterly barbarous and disgusting custom. The meat is brought to table ready cut up into small morsels, which can be taken up with the chopsticks. The only use made of a knife at table is to separate any small pieces of meat that may adhere together; and, for this purpose, a narrow, long-bladed knife is generally kept in the same sheath with the chopstick.

"As a rule, every Chinaman who can afford so cheap a luxury has his chopstick-case hanging from his girdle. The case is made of different

materials, such as shagreen, tortoise-shell, and ivory. Specimens of the two latter kinds of case are in my collection. The ordinary case contains the two chopsticks, the knife, and a flat ivory toothpick. One of these cases, made of tortoise-shell, is shown in the above illustration (Fig. 1), the chopsticks (2), the toothpick (3), and the knife (4), being seen by the side of it.

"Sometimes, however, a wealthy man will carry a much more complicated set of table apparatus, a very good

Chinese Chopsticks.

specimen of which, kindly lent by Mr. Wareham, is shown in the illustration. First we see a cylindrical case suspended by a strap, and, on examining it, we find that the top and bottom are movable, and slide up and down the strap. Within this case are the usual chopsticks, the knife, and the toothpick, but besides them there is a spoon for eating soup, a neat little quatrefoil saucer for soy, and a peculiar two-pronged fork, with its prongs united in the middle by a floriated ornament."

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER XXV.—MORTON'S CHOICE.

THE morning on which Miss Tresham left Annesdale was wearing into noon, when a note from Mrs. Gordon was brought to Mr. Annesley. It was written after her return from Tallahoma, and was brief, to the extreme of epistolary brevity.

"MORTON HOUSE, Friday morning.

"DEAR MORTON: Come to me as soon as possible—at once, if that be possible. I have something of importance to say to you. Yours,
"PAULINE GORDON."

Morton chanced to be standing near Irene Vernon when he read this, and his change of color at once struck that young lady, who was a very close observer.

"Nothing is the matter, I hope, Mr. Annesley?" she said, as he looked up and met her eye.

"N—o," answered he, a little hesitatingly. Then he glanced down at the note again, and went on: "Nothing is the matter, I hope; but I must go at once to Morton House. My cousin has sent for me."

"Oh, how provoking! What will become of our ride this afternoon?"

"I am obliged to ask you to defer it. You won't care, will you? I am very sorry, but"—

"But, if it must be done, that is an end of the matter. The weather may be as delightful to-morrow as it is to-day. At all events, don't consider me, if your cousin has sent for you."

"You are the embodiment of obliging goodness," said Morton, gratefully. Then, to the servant still standing by, "My horse."

While the horse was being brought out, the young man curbed his impatience as well as he could; and, to enable him to do so, took Miss Vernon partially into his confidence. He did not tell her all of Mrs. Gordon's story, but he told her enough to account for his abrupt departure, and to enlist her sympathy. After a while they wandered from this immediate subject to certain side issues.

"There is one thing that might console your cousin a little," said Miss Vernon, as they walked up and down the piazza, with the soft air and the bright sunshine all around them. "She has gratified the wishes and fulfilled the desires of her heart. It is not given to everybody to do that, you know. She must have tasted some sweets before the bitter came—ought not that to help her to resignation?"

"Would it help you, do you think?"

"I don't know—but it seems to me it would. Any thing is better than dull, even stagnation. A still day of leaden cloud is the dreariest thing in the world—don't you think so? Ah, how bright and beautiful it is to-day! If I knew that to-morrow would bring a blinding storm, I should still take the sunshine, and enjoy it while it lasted."

"You surprise me," said Morton, smiling. "I had no idea that you were such an epicurean. But," he added, more gravely, "you are mistaken. If you had ever known Mrs. Gordon, you would see that the lesson of her life is directly opposed to the sentiment you are advocating—a sentiment which has found its best expression in the words, 'Let us eat and drink, for to-morrow we die.' The lesson of Mrs. Gordon's life teaches with unusual force a thing which has almost grown trite in our ears—this is, that the gratification of our own wishes, and the fulfilment of our own desires, never brings happiness. Of course, we all think it would do so; and, since there are few of us who are free enough to test the matter, we go on to our lives' ends thinking so. But, in truth, when we see those who possessed the freedom which we lacked, and who marched forward to the goal of their own hopes, what is the result? Mrs. Gordon was one of those people, Miss Vernon; and, if you could see her, your own eyes would assure you that, for her, not only the end, but the very hour of fruition—if, indeed, there ever is an hour of fruition—was disappointment and bitterness."

"But, at all events, she has not merely existed—she has lived."

"You must give me your definition of life before I can grant you even that," he said, with a slight, grave smile. "Does life consist in

a certain amount of sight-seeing, a certain number of vicissitudes to be endured, a certain depth of emotion to be sounded? I know that the idea of the day runs somewhat thus, and that discontent is rife in many places, because some people declare that life is only worthy of the name when it has known these things. But it seems to me that minds which think thus, must reason very shallowly—else they could hardly fail to perceive that, by such a standard, they exalt the worst class of the world above the best. In their sense, who has lived most thoroughly, the saint in his cloister, the philosopher in his study, the great minds and hearts that solitude has nurtured in all ages, or the reckless adventurer, the wandering sybarite, the men who sound every scale of human life, and, dying, pass from human memory like the brutes that perish? Miss Vernon, will you tell me what you meant by saying that Mrs. Gordon had lived?"

"I meant exactly what you have condemned, Mr. Annesley. I meant that her existence has not been tame and stagnant, and cast in one groove; but that it has been like a varied drama, filled with many scenes and many emotions. In short—well, I express myself badly, but I think you know what I mean."

"Yes, I think I do. You mean that, to you, her life seems like a picture, where the shades only heighten the effect; or, like a story, which would lose half its interest if it had no tragic incidents, or pathetic close. But the tragedy and the pathos are not poetical, but very bitter, when they come home to us in our own lives. If you will allow me to make a personal application of my meaning, I should judge from what you have said just now, and from many things which have gone before, that you find your life dull and tame—it may be, even weary. But does it never occur to you that this very life seems to others like one long sunny idyl of brightness and peace? Believe me, the chief secret of happiness—the only one, in fact—is content with that life, and mode of life, which has fallen to our portion. I don't mean that we can obtain this content by merely wishing for it," said the young man, with a wistful look on his face; "but we can gain it by fighting for it, and it is worth a battle. Forgive me, if I seem to be preaching to you," added he, with a smile. "I have very imperfectly expressed the thoughts your words suggested to me, but perhaps you can seize the idea through the rude garb in which I have clothed it. It has only come to me dimly and feebly, but there is a thrill about it which tells me that I am on the threshold of a great truth. Yonder is my horse, at last. Now my prosing is at an end. Good-by."

"Good-by," echoed Miss Vernon, giving her hand, unconsciously, to the one he extended. "I did not know you thought this way," she went on, abruptly. "Your creed seems to me simple, and yet—I fear I am very morbid," she said, quickly. "You have done something to make me ashamed of it."

"You are a little morbid," said Morton, smiling. "You must forgive me if I tell you so, and you must also forgive me if I suggest the remedy. May I?"

"Of course you may."

"Forget yourself, then. I don't mean that you think of yourself a great deal," he went on, as he saw her flush; "but we are all prone to self-consciousness, and, in some natures, it fosters vanity; in others, a morbid habit of introspection which—pshaw! I am drifting into metaphysics, and I know you hate the stuff as much as I do. Once more, good-by. I am off for good, this time."

Miss Vernon stood on the piazza and watched him as he rode away. He looked very gallant and handsome; for, like most of his countrymen, he rode to perfection, and never appeared so well as on horseback. When he was out of sight, she smiled, to herself, with a mixture of archness and sadness. Seen just now, her face wore its very softest and sweetest expression.

"It is not hard to tell where he obtains his philosophy," she thought. "No doubt he is perfectly sincere in it, but it is amazingly easy to be resigned to success, and to be content when every desire of one's heart is gratified. The test will be when disappointment and failure come. If his philosophy helps him to bear that, it will be genuine, and worth practising. Will it help him to bear it, though? Who can tell?"

Regarded as an abstract question, who, indeed? Yet the time was fast approaching when the abstract question would assume practical shape, and when Miss Vernon's question would be answered in a way which Miss Vernon could not, at that moment, possibly have foreseen or imagined.

She was still standing on the piazza, still looking absently out on

* EXTENDED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

the bright landscape, still thinking of Morton's philosophy, and of the chances for and against his practising it, when Mrs. Annesley appeared at the open hall-door, and walked up to her.

"All alone, my dear?" she said, with a smile, in which the kindness for once was real. "I thought I saw Morton with you a few minutes ago?"

"You did see him with me a few minutes ago," Irene answered; "but he is gone now. Didn't you hear the tramp of his horse?"

"I heard the tramp of somebody's horse, but I had no idea that it was his. Where has he gone?"

"To Morton House, I believe."

"To Morton House!" The extreme of surprise appeared in Mrs. Annesley's face. "Why, what has taken him there? And so suddenly—without a word to me!"

"A note from Mrs. Gordon was the cause of his going," said Miss Vernon, carelessly. "He showed it to me, because he had an engagement to ride with me, which, in consequence of this, he was obliged to break."

"And what was in the note?"

"Only a few lines, begging him to come to her at once, on a matter of importance."

"Nothing more?"

"Nothing more at all."

"How very strange!" said Mrs. Annesley, with her color rising. "A matter of importance, and not one word to me—either from Pauline or Morton. My dear, excuse me, and don't think it is curiosity I feel—I am surprised, and, I confess, a little wounded, that I should be openly excluded from the confidence of my son."

"I don't think Mr. Annesley knew what Mrs. Gordon wants with him," said Miss Vernon, seeing the mischief she had unwittingly done, and being anxious to smooth the lady's ruffled plumes. "He seemed very much surprised, and, I am sure, he never thought—"

"That is just it," said Mrs. Annesley, a little bitterly. "Of course, he never thought—or perhaps he receives Pauline's confidence with the stipulation that it is to be kept from me. But we mothers must make up our minds to bear this," said she, recovering her usual manner by an effort. "As our children grow older, others supplant us in their hearts and minds, and we must endeavor to abdicate with a good grace. If we could only choose our successors, it would not be hard to do so," she added, drawing the girl's hand within her arm, with a smile.

"Dear Mrs. Annesley, you do your son great injustice," said Irene, speaking quickly. "No one will ever supplant you in his heart. I don't think you know how much he loves and admires you. It often makes me admire him to see it."

"You reconcile me to abdication, my dear," said the lady, smiling the same gracious smile. "Ah! if I can only choose my successor"—she broke off, as Irene colored and drew back a little. "Forgive me—I only meant to say that I am very happy if I am one link to draw you nearer to us. Shall we go in now? I am afraid you find it cold out here."

They went in; and no sooner was Mrs. Annesley able to make a retreat, than she retired to her own room, and rang for her maid.

"Get my wrappings, Julia," she said, "and order the carriage. Tell Sarah to have dinner an hour or two later than usual, for I am going to Morton House, and shall not be back at the ordinary time."

While his mother, at Annesdale, was preparing for her drive, Morton felt as if the ground had absolutely yielded beneath his feet, when Mrs. Gordon, who was in a state of strangely-passionate excitement, told her story at Morton House. After it was ended, she gave the reason that had made her send for him.

"I have been foolish enough to encourage you in your fancy for this girl," she said. "It was my duty, therefore, not to let you rest an hour in ignorance of her true character—not to fail to tell you at once that I consider her an adventuress of the most decided stamp. Morton, for Heaven's sake—for the sake of your name, your honor, and your friends—do not give another thought to her!"

"One moment," said Morton, who was pale, but reticent—evidently he meant to hear every thing, and say nothing that would commit him to any positive line of action—"you have not told me yet why you think this."

"Could I think it on better ground than that of her association

with St. John? You don't know—you can hardly imagine—what he is!"

"But is it just to judge her by him?"

"What could be more just, when there is evidently some link of familiar connection between them? Morton, put the case as if it regarded somebody else. What would you think of a woman who was on terms of—well, we will say intimate friendship, with a man than whom the lowest sharper is not more destitute of honor—with a man whose record is one that exiles him forever from the companionship of honest people?"

"She may not know this."

"Ask her if she does not! I am willing to risk every thing on her reply, for I think that circumstances have made it impossible for her to speak falsely. Ask her if she does not know who and what St. John is."

"You are right," he said, rising. "I will ask her. That is the straightforward and honest thing to do, after all. Don't think that I doubt you," he went on, looking at his cousin. "Don't think that I am ungenerous enough to blame you for what you have said. On the contrary, I thank you. I should certainly hear all that is said—if only that I may be able to answer it. You must forgive me that I cannot take any mere circumstantial evidence against her. It seems to me that I should be a very contemptible fellow, if I did."

"And you are going to her?" said Mrs. Gordon, bitterly. "Well—perhaps it may be best; but oh, Morton, don't be rash! Don't say anything that you may hereafter regret. Give me that much credence, at least."

He bent down, and kissed her cheek—smiling with an attempt at cheerfulness which went to her heart more surely than any pathos could have done. He was mad and foolish, she thought; he was about to risk the happiness of his whole life in the blind determination to trust to the last; yet, even while she felt impatient, she could not but be touched by his simple, steadfast fidelity. It had all the elements of the highest chivalry in it, though nobody could have known this as little as Morton himself. It was Mrs. Gordon who recognized it, and who, in the midst of her anxiety and irritation, felt suddenly thrilled by admiration. Still she could not but make one last effort.

"Morton," she said, catching his hand as he bent over her, "listen to me. I am much older than yourself, and, although I am a woman, my knowledge of the world is much greater. Besides, I am your cousin—the only Morton left, the only one of the name which hereafter you will have to represent. To see you what you are—to know you brave, and true, and loyal—has given more sunshine to my life than you would readily believe. If he lives, Felix's duties will be elsewhere—some day, therefore, this house must be yours. This has been my only comfort. Morton—remember that it was through my fault my father left here; it was my fault my brother never took his place. It is a horrible thing to see, when it is too late, a direct sequence of events—to know that one's own hand has set in motion a tide which ends by sweeping away every thing that life holds dear. This has been my lot. Don't add one more disappointment to it—one more bitter memory. Don't ruin your life, and tarnish your name, by marrying this woman."

The earnestness, the passion of her appeal, touched Morton deeply. He saw plainly enough that the question of his happiness was with her entirely subordinate to the question of family pride; but he sympathized with this sentiment sufficiently to feel its supremacy no hardship. In these times, the thought that any thing is of more importance than the gratification of a sentimental fancy is quite obsolete; but, in that day, a few people (and Morton was one of these people) clung to the old-fashioned idea that there were certain claims to be considered in such a case, certain higher duties than the duty of marrying and giving in marriage, certain principles to be observed, and, if any or all of these things clashed with love, then love must give way. We of the present period know better than that. Having the grand advantage of modern enlightenment, we know that the first duty of every reasonable human being is a duty to self. And as selfishness generally culminates its strength in love—not divine love, which takes us out of ourselves into something higher, but that passion bearing its name, which is of the earth earthy—so love must needs be taught to override all the grand old watchwords of Faith, and Honor, and Duty. But, as we have said, Morton was not of this day. The jargon of the new school of moralists would have been a foreign language to his ears. The conception of sacrifice—the conception which is the key-note of

every nature which deserves to be called noble—had always been familiar to him, had grown with his growth, and strengthened with his strength. As far as he was concerned, he was ready to put his own wishes down under his feet for the sake of any thing that had a right to demand the offering; and, reared as he had been, the name that he bore was one of these things. No sacrifice could be counted too costly that would help to keep it pure and untarnished.

Regarded from this point of view, his course seemed clear—but then there was another side to the question, or else all this explanation need not have been written. To Morton, life had always seemed a very simple thing, and he had never had much sympathy with those who professed to find it otherwise. "The path of duty is always clear and straight," he said, "and, if we follow it, we can't possibly go wrong. The people who are involved in moral difficulties, generally make them for themselves." Now the time had come for him to learn—as everybody who deals in such fluent generalities sooner or later must learn—that life is, after all, a very complex tissue, and that, without being addicted to the dangerous pastime of splitting hairs, we may find ourselves on the horns of a moral dilemma, and be honestly and seriously puzzled thereby. Two duties were clashing with him now, and the young man felt sorely uncertain as to which had the strongest claim to his respect. On the one side was the name to which a gentleman owes his first duty. On the other, that principle of steadfast fidelity which every tradition of his creed, and instinct of his nature, made a solemn obligation. Moved as he had been by Mrs. Gordon's passionate appeal, he was not yet ready to set this aside as naught—not yet ready to believe that the higher duty conflicted with it.

He walked away to the window, and stood there looking out. Before him lay the broad Morton fields, and the distant shadowy Morton woods. Above him was the roof which he had just heard Mrs. Gordon declare might some day be his own—at a little distance from him sat the woman rendered so sadly desolate by her own folly, the woman who had appealed to him in the name of family honor, who had bared her heart to him, and prayed him to spare her another cruel blow. Here it would have seemed as if every influence weighed heavily in one scale—as if here the side which all these things represented surely must prevail. Yet here his heart spoke to him as it had never spoken before. Here Katharine Tresham's face rose before him with a pathos and a beauty which the face itself had never owned. Suddenly the passion which he had heretofore so steadily curbed, so sternly kept obedient to his will, rose up in revolt, and swept over him in a great wave that fairly startled him. A voice seemed to speak in his ear, and to say: "If you give her up in this way, you are a dastard!" It was in obedience to this voice that he turned at last to answer Mrs. Gordon.

"Until I have seen Miss Tresham, I cannot tell what I will do," he said. "I can only say that I will try to act as seems to me right. Many things have conspired to perplex me of late; and, at this moment, I am only certain of one thing—that I will not give her up! I will trust her until she herself proves or disproves your opinion of her; and I should not deserve the name of gentleman if I did not do so."

"This is your decision?" asked Mrs. Gordon.

"This is my decision," he answered.

Something like a faint smile of pity came to the lips of the woman who had gone her way, and who now looked back on the results of it.

"We are all alike," she said. "Every one of us must needs run our own course of folly, and wreck our lives according to our own fancy. I suppose it is useless to reason with you; and I, of all people, have no right—save the right of sad experience—to bid you stop and consider. Yet"—she paused a moment—"yet I fancied you would be different. I fancied you would rate the duty you owe to your name above your passion for a woman's face."

"And I thought you would understand me better," he answered, quickly. "I thought you would believe that I do rate it above every thing excepting my duty to God, and that if my love for Katharine Tresham clashed with it, I would sacrifice that love without an instant's hesitation."

"If it clashed with it?"

"Yes, if it clashed with it. You must pardon me that I say 'if'—but your opinion is only your opinion, you know; and, in a matter which concerns the happiness of my whole life, I cannot accept any thing but positive evidence."

"One word more," said Mrs. Gordon, as he extended his hand to

bid her good-by. She did not take the hand, but rose to her feet, holding her own tightly pressed against her heart. "You will not misunderstand what I am going to say, I am sure; you will not think that I mean to influence you by any thing so foolish, and (from me) so impertinent as a threat," she went on. "But I think it right to place before you the consequences of the step you seem determined to take. Morton, that woman is allied in some way to the man who helped to ruin my life and to murder my brother. If you make her your wife, you can never be master in this house."

She spoke quietly, but in a moment she saw that she had spoken unwisely. Her warning certainly had much of the nature of a threat in it, and the man must be cold-blooded, indeed, who, in a matter of this kind, submits to be threatened.

"You might have spared me this," said Morton, with more *hauteur* than he intended. "My resolution with regard to Miss Tresham did not need a spur; and your own experience might tell you whether my sense of family obligation is likely to be increased or diminished by the knowledge of such a penalty. I see that I had better go," he added, after a short pause. "You have wounded me, and I may pain you, if I remain any longer. Forgive me if I have seemed abrupt or ungracious. I—this has been a harder struggle than you think."

She let him go in silence. But after the last echo of his step had died away, the reason of this became evident. She sat down, and a rush of tears came through the thin, white fingers which covered her face.

Half an hour later, Babette opened the door, and brought in a card.

"The lady is in the drawing-room, and insists on seeing madame," she said.

"I can see nobody," answered Mrs. Gordon, languidly. Still she extended her hand, and took the bit of pasteboard. She started when she read Mrs. Annesley's name.

CHAPTER XXVI.—MR. MARKS ASSERTS HIMSELF.

MRS. MARKS's doubt of what "Richard" would have to say on the subject of Miss Tresham's flitting, proved to be well founded. When the cashier came home to dinner, and heard his wife's eager recital of the events of the morning, he looked decidedly grave. The mention of Mr. St. John recalled Mr. Warwick's opinion of that gentleman, and for Mr. Warwick's opinion nobody entertained a greater respect than his brother-in-law. Then Mrs. Gordon's warning seemed to Mr. Marks a much more important matter than it had seemed to his wife.

"Mrs. Gordon would never have spoken in that way without some cause," he said, when Mrs. Marks told her story. After this, came the news of Miss Tresham's sudden departure—at which Mr. Marks startled his wife by the astonishment of his face.

"Gone!" he said. "Gone, just at the close of the holidays, and before she had been in the house more than a few hours! What is the meaning of it?—what did she say was the meaning of it?"

"I—really, I believe she only said she was going to Saxford," answered Mrs. Marks, decidedly taken aback. "She asked me if I had any objection, and I told her no. I thought a day or two would not matter about the children, and it never occurred to me that you would mind it."

"I mind it, because I don't understand it," said Mr. Marks, with the same unusual gravity. "It don't look well for Miss Tresham to be neglecting her duties in this way; but, as you say, a day or two wouldn't matter—if a day or two's loss of time was all. What does matter, is some explanation of this strange conduct. Think, Bessie! Did she tell you nothing about *why* she was going to Saxford?"

"She did not tell me a word," said Mrs. Marks, looking and feeling a little crestfallen. "She came in here in a great hurry, just as Tom was setting the table, and asked me to lend her some money, as she had none, and wanted—Why, Richard, what on earth is the matter?"

There was reason enough for asking the question. Mr. Marks's eyes opened wide on his startled wife, and the expression of his face fully warranted her surprise. When she broke off in this way, his lips had already formed an exclamation.

"She asked you for money!" he repeated, hastily. "Bessie, there must be some mistake! Are you sure she asked you for money?"

"Of course I am sure! How could I be mistaken?"

"And did you lend her any?"

"Of course I did—I lent her ten dollars."

"Ten dollars!"

The cashier's astonishment seemed to have reached the utmost extreme possible to that emotion. He walked up and down the floor, then came back and stood before the fire, looking down into the glowing coals.

"This is the strangest thing I ever heard of!" he said, at last. "I confess I don't understand it."

"What is the matter?" demanded Mrs. Marks, who was, in her turn, excited by curiosity. "What is strange?—what is it you don't understand? Why shouldn't Miss Tresham ask me to lend her some money?"

Her husband turned and looked at her.

"The simple reason why Miss Tresham should not have asked you to lend her some money is, that I paid Miss Tresham no less sum than a thousand dollars no longer ago than last Tuesday."

"Richard!"

"Her receipt is at the bank to show for it," said Mr. Marks; "and now—on Friday—she comes to you to borrow ten dollars! It is very strange conduct, to say the least of it."

"A thousand dollars! Good gracious! What do you think she could have done with it?" cried Mrs. Marks, all in a flutter. "She certainly said she didn't have any money, and she certainly took two five-dollar notes from me. Richard, what on earth could she have done with it?"

"That is more than I can pretend to say," answered her husband. "But one thing is certain—I don't like the look of matters. When Miss Tresham drew that money, she was very particular about requiring gold. Then she wrote a note in the bank, and had a meeting in the parlor across the passage, with this St. John. After that she went away, and Warwick came in. The first thing he told me was that the man—St. John, I mean—was an unprincipled scoundrel; and, though he did not give me his reasons for saying so, he spoke in a manner which showed very plainly that he had reasons, and good ones, for the opinion. I confess that, at the time, I didn't pay much attention to the matter; but, looking back now, it seems to me more serious. After what has happened to-day, I feel uneasy—I feel certain that something is wrong."

"Not with Miss Tresham, Richard—I'm sure there's nothing wrong with Miss Tresham."

"What do you know about Miss Tresham, Bessie? You may forget, but I don't, that we engaged her when she was an entire stranger to us, and that, after living with us two years, she is, as far as her own affairs are concerned, as much a stranger as ever."

"But you know how nice she is!" said Mrs. Marks, indignantly. "You know all that she has done for the children, and—and all that she has done for me. You liked her yourself, Richard—you know you did!"

"I like her now," said Mr. Marks, with that stolid masculine coolness which some men possess in superlative degree, and which is, to the feminine mind, the most exasperating thing in the world. "But what has that got to do with the matter? I'm not talking about liking her. I'm talking about her drawing that money, and borrowing ten dollars from you three days later—I am talking about her acquaintance with this St. John, and what Mrs. Gordon said of it—and I'm talking of her going away without a word of explanation, just as the holidays are at an end."

Mrs. Marks sat dumb. She was a good partisan; but even the best of partisans must have something besides mere opinion with which to oppose stated facts. On any one of these grounds, she was unable to say any thing for Miss Tresham. After a minute's silence, Mr. Marks resumed:

"One of two things must happen. Either Miss Tresham has gone away for good—than which, I confess I think nothing more likely—or else she will come back at the stated time. If she does come back, there must be an explanation required from her. I must know who Mr. St. John is, and on what footing he comes here. Otherwise, I may be sorry to part with her, but my duty is plain—she must go. I cannot keep a governess who acts as Miss Tresham has been acting lately."

So spoke the head of the household in his official capacity; and much as his wife's sympathy ranged on the side of the governess, she

could not deny that he spoke with reason. Miss Tresham's conduct certainly justified all that he said of it. Yet the unreasoning faith of Miss Tresham's advocate was not shaken for an instant. O wonderful instinct of woman! There is nothing like it in the world; and where it has taken one woman wrong, it has led a hundred thousand right. Yet there are people who would like to educate and "develop" it into a "reasoning faculty!" Why does not somebody come forward to paint the lilies of the field, and furnish us with patent improved sunlight, warranted to shine on every occasion?

Oblivious, for once, of his business duties in town, Mr. Marks was still standing before the fire, considering the perplexing subject which was on the domestic *tapis*, when there came a knock at the front door.

"There, now!" said Mrs. Marks, starting. "Of course it's somebody to see me—Mrs. Sloan, I expect—and what a sight I am! Go, Richard, please, and ask her into the parlor."

Mr. Marks obeyed, and, as he carelessly left the door open behind him, his wife heard him exchange a cordial greeting with the visitor; and then, without any warning, he came back, and ushered Morton Annesley into the dining-room, where the uncleared dinner-table stood in the centre of the floor—Mrs. Marks having been in such a fever of impatience to tell her story, that she had not allowed Tom to finish his duties.

"Oh, my dear!" she cried, in a tone of expostulation. "But it was too late. Morton—who would have been none the wiser if there had been an elephant, instead of a dinner-table, in the middle of the floor—walked forward and shook hands with her."

"Pray don't speak of it," he said, when she began apologizing. "I hope you don't consider me a stranger. Mr. Marks, at least, was more complimentary, for he asked me in at once. I hope you are well. I have not seen you for a long time—not since before Christmas, I believe. May I wish you a happy New Year, since we did not have an opportunity to exchange Christmas greetings?—Yes, Mr. Marks—the roads are quite heavy. That rain yesterday has made them muddy. My boots show it—don't they?"

People less clear-sighted than Mr. Marks and his wife might have perceived that the young man made these disjointed remarks very absently, that his eyes turned unconsciously toward the door, and that he started at every noise in the passage outside. They glanced at each other significantly, but were kind enough to take no further notice, and talked of indifferent things, until Morton himself came directly to the point, in his frank, somewhat boyish fashion. Mrs. Marks spoke of Miss Tresham's enjoyment at Annesdale, and Morton instantly caught at her name.

"I hope she did enjoy herself," he said. Then he added, quickly: "Is Miss Tresham disengaged just now?—I should like to see her, if she is. I am obliged to return to Annesdale very soon, and I am particularly anxious—"

He stopped short. The expression of Mrs. Marks's face warned him that something was wrong. He looked hastily from herself to her husband, and read the same expression still more strongly stamped on the masculine face.

"What is the matter?" he asked, impetuously. "Miss Tresham—"

Here Mrs. Marks interrupted:

"I am sorry to say, Mr. Annesley, that Miss Tresham is not at home. She left to-day for Saxford."

"Left!"

Morton was astounded. In a moment his mind ran over a terrible possibility—the possibility that there had been some misunderstanding between Miss Tresham and her employers, which had resulted in her leaving Tallahoma permanently.

"Left—for Saxford!" he repeated. "Mrs. Marks, what is the meaning of that?"

"Don't ask me, Mr. Annesley," said Mrs. Marks. "If my life depended on it, I could not tell you a thing more than just that—she has gone to Saxford. I am sure it didn't strike me as strange; but here's Richard has been talking about it, and—"

"It is very strange," said Richard, speaking for himself. "I don't pretend to understand it. I don't wonder you are astonished, Mr. Annesley. I was astonished myself when I came home and heard that Miss Tresham was gone."

"When will she be back?" asked Morton, catching at the first idea which presented itself to him.

"On Monday," answered Mrs. Marks, to whom the question was

addressed. "She said she would be back on Monday, Mr. Annesley, and I am sure she will come. Miss Katharine never breaks her word."

"But why did she go away?" asked Morton, impatiently. "Did she not tell you why she went?"

Mrs. Marks looked at her husband, and Mr. Marks looked at his wife. This time Annesley perceived the glance, and saw plainly that there was something in reserve which he was not to hear. Determined to know if any thing had happened after Mrs. Gordon left the house, he boldly broke the ice at once.

"I have been to Morton House and seen my cousin," he said. "I am aware of the unfortunate"—he stopped a moment, as if searching for a word—"the unfortunate discussion which took place this morning. Will you allow me to inquire if that discussion, or any thing resulting from it, was the cause of Miss Tresham's leaving Tallahoma?"

On this point Mrs. Marks professed utter ignorance, and she was going on to state every thing which she had already told to her husband, when Mr. Marks broke in:

"Since you have seen Mrs. Gordon, Mr. Annesley, I need not hesitate to say to you that I am seriously perplexed and uneasy about this affair of Miss Tresham. As I was telling my wife, just before you came in, there are more reasons than the reason of Mrs. Gordon's warning for distrusting Mr. St. John, and Miss Tresham's connection with him. You know her quite well, I believe: will you tell me if she has ever mentioned the man or any thing about him to you?"

Morton flushed. He remembered the eve of New Year, and the manner in which Miss Tresham had repulsed his first and last attempt to win her confidence. Oh, if she had only been frank with him, the young man thought, if she had only trusted him, and given him a right to speak for her! But she had not done this, and there was nothing for it but to answer Mr. Marks's question by the truth.

"She has never mentioned Mr. St. John's name to me," said he. "But I have never been in a position to receive her confidence."

"Hum!" said the cashier, significantly—looking the while at his wife, and smoothing with one hand his well-shaven chin. "I cannot find," he said, after a moment, "that Miss Tresham has ever mentioned Mr. St. John's name to any one; and, even after Mrs. Gordon's visit, she gave my wife no explanation of his purpose in coming here, or of her acquaintance with him. My own impression," added he, "is, that she has left Tallahoma simply to avoid giving this explanation."

"But when she returns on Monday?"

"When she returns on Monday—or, to speak more correctly, if she returns on Monday—I shall certainly endeavor to obtain this explanation. If I cannot obtain it, Mr. Annesley, my mind is made up—Miss Tresham must leave my house."

An indignant reply rose to Annesley's lips, but he had sense enough to restrain it—sense enough to see that he would do harm, instead of good, by uttering it. What business, after all, was it of his? What right had he to interfere in Mr. Marks's domestic affairs? Angry as he was, he asked himself this question, and accepted the obvious reply. During the minute which followed Mr. Marks's speech, nothing was said. Then Annesley rose, and begun drawing on his gloves.

"If you will allow me, I will call again on Monday to see Miss Tresham," he said, with unusual formality. "I am sorry—very sorry that she has left Tallahoma. But, if you will excuse me, Mr. Marks, I would advise you to suspend judgment upon the matter until she returns."

Before Mr. Marks could reply to this advice, there came an interruption. The door opened, and Letty appeared. She addressed herself to her mistress.

"There's a gentleman out here to see Miss Tresham, ma'am, and he wants to know if you can tell him when she will be back."

"Miss Tresham will be back on Monday," answered Mrs. Marks. "Tell the gentleman—or, no, stop.—My dear" (to Mr. Marks), "perhaps you had better see who it is, and speak to him yourself."

Mr. Marks went out, and Morton, after shaking hands with Mrs. Marks, followed him. At the front door they met St. John, whom Morton had seen once before, and the cashier never at all.

A glance was sufficient to show them that Mr. St. John was very decidedly out of temper. The face, which on occasions could be so bland and smiling, was now set and lowering in singularly marked

degree. It did not even lighten when he saw the two men who advanced toward him.

"Mr. Marks, I presume," he said, raising his hat as Mr. Marks came down the passage. Then, glancing at Annesley, he started, and bowed without any sign of recognition. For some reason, he evidently chose to ignore their previous meeting, and addressed himself solely to the master of the house.

"I have called to see Miss Tresham," he said, "and I am surprised to hear from your servant that she has left Tallahoma. Will you allow me to inquire if this is true?"

"It is true, sir," answered Mr. Marks, with business-like brevity.

"May I ask where she has gone, and when she will return?"

"She has gone to Saxford, and will probably return on Monday—at least she told my wife to expect her on that day."

A dead pause. An expression on Mr. Marks's face, and in Mr. Marks's attitude, which said: "Your questions are answered. Take leave." An expression on St. John's face of perplexed astonishment, and half-absent thought, which Annesley, watching him closely, felt sure was not assumed. He looked silently at his boots for a second, then glanced up again at the cashier.

"Excuse me," he said, "but this news is very unexpected—and surprising. When I was here this morning, Miss Tresham gave no intimation of any such intention as this. Shall I trespass too much on your kindness if I ask you to inquire whether she left any message or note for me—that is, for Mr. St. John?"

"I can inquire, sir, but I do not think it is likely," said Mr. Marks, with the same forbidding civility.

He walked down the passage, and, without entering the dining-room, held an audible conversation with his wife.

"Bessie, did Miss Tresham leave any note or message for Mr. St. John?"

Reply of Mrs. Marks from behind the scenes: "Not a word, or a line, with me, Richard."

"You are sure of this?"

"I am perfectly sure. She never mentioned him."

"Miss Tresham has left nothing for you, sir," said Mr. Marks, returning to Mr. St. John. "I regret that I am not able to give you any further information about the reason of her departure."

"You can give me one item of further information," said St. John, manifestly proof against the plainest of hints. "Is Miss Tresham in the habit of going to Saxford?"

"She is in the habit of going there once a month or so."

"May I ask if she has any acquaintances there?"

"She goes, I believe, to see a Catholic priest," answered Mr. Marks. Then he lost patience, and showed it in a way very unusual with him. "You must excuse me, sir, if I decline to answer any more questions. Miss Tresham's private affairs are her private affairs; and, since she has been living in my family, I have never interfered with or inquired into them."

"Allow me to admire your discretion," said Mr. St. John, with the same bow which had once irritated Morton by its covert mockery. "I regret to have trespassed so long on your time and civility, and I have the honor to wish you good-day."

In another bow he included Annesley, and then went his way, leaving Mr. Marks with an angry sense of having had the worst of it.

"An insolent scoundrel!" said he, as soon as St. John was out of hearing. "What do you say, Mr. Annesley?" he went on, turning to Morton. "Don't you think that 'rascal' is written legibly on his face?"

"I don't especially fancy his face," said Morton; "but I should not like to say that any thing particular is written on it. One thing is certain," he went on, more slowly; "Miss Tresham's departure has taken *him* by surprise."

"That is to say, he looked as if it had," said Mr. Marks, who, what with Mr. Warwick's opinion, Mrs. Gordon's opinion, and his own discomfiture, was ready to believe the very worst of Mr. St. John. "Candidly, however, Mr. Annesley, I don't trust any thing about him."

"You think—"

"I think that I will follow your advice of a little while ago, and wait and see. Miss Tresham may come back on Monday. If she does, we can clear up matters speedily, and it is not worth while to trouble ourselves with conjectures."

"Meanwhile, however, you distrust Mr. St. John?"

"Meanwhile, I do most decidedly distrust Mr. St. John."

With this interchange of sentiment, the conversation ended. The two men walked to the gate together, and there separated—Mr. Marks going into town, and Annesley riding off in the opposite direction.

[TO BE CONTINUED.]

BERTHA'S LEGACY.

IT was a night in the month of January, cold, dark, and wet. The wind blew in fitful gusts, and the rain and sleet fell in torrents. Cabs were flying in all directions, and straggling groups of men and women, homeward bound after their day's labor, hurried along the deserted streets.

The boulevards, squares, and public thoroughfares of Paris, free from loungers and promenaders, wore an aspect of desolation that boded ill to the homeless poor.

In contrast to the inclemency out-of-doors, many happy families gathered closer around their glowing hearths, enjoying their comforts all the more that they were securely sheltered against the fury of the warring elements.

In the drawing-room of a splendid hotel, situated in a quiet quarter in the neighborhood of the *Chaussée d'Antin*, such a family was assembled.

A great fire shone and crackled in the chimney; gilt-bronze lamps, encrusted with enamels, shed a soft light throughout the apartment; a rich Gobelin carpet covered the centre of the bright-polished floor; and the elegant furniture and costly ornaments, artistically arranged, were so many convincing proofs of good taste and ample means. M. Constantin, in fact, was exceedingly rich, and proud, because he was the artificer of his own fortune. Upright and cautious in all his dealings, he, after many years of successful operations, skilfully accomplished, found himself at the head of one of the largest banking-concerns in Paris, recognized as a sure guide in investments, and a competent authority in all things pertaining to finance. On the evening in question, M. Constantin was in excellent spirits. During the day, the balance-sheet showing the result of the previous year's operations was presented to him, the profits being larger than on any former occasion, so that he was thoroughly disposed to indulge in the good-humor of a prosperous and self-satisfied man. Reclining in his easy-chair, he was surrounded by his romping children, who listened to his amusing stories, which they frequently interrupted with their merry peals of laughter.

At this moment, outside, a very different scene was to be witnessed. A lonely woman stood motionless before the door, the umbrella over her head protecting her but slightly from the rain which streamed down her dress, forming a pool of water at her feet. After some minutes' hesitation, she mustered courage and knocked at the door with a trembling hand. A servant opened it, and, requesting her to be seated in the antechamber, informed her master that a woman wanted to see him on urgent business.

"A woman! What woman? what does she want?" asked the banker.

"She did not seem willing to give her name, but looks respectable, and has come all the way from *La Chapelle* to see you."

"From *La Chapelle*, such a night as this? Poor woman!" said Madame Constantin. "Has she a carriage?"

"Oh no, ma'am," replied the servant; "she has come on foot, and is drenched to the skin."

"Tell her to call at my place of business to-morrow," said the annoyed banker. "I cannot possibly be disturbed at home."

On observing an expression of interest and compassion flit across the face of his eldest daughter Bertha, who was in delicate health, he changed his mind, and went to see what his visitor wanted.

After an absence of ten minutes, he returned, visibly out of temper, muttering something about the impertinence of intruders.

On being asked by his wife what the stranger wanted, he said:

"Oh, the husband of this Madame Renaud is a bookseller, I believe; he has been foolish enough to stand surety for his brother, who owes me a few hundred francs, and is consequently embarrassed. She pretends that Renaud is in bad health, and cannot just now refund the amount, but wants me to accept it by instalments, which proposal I, of course, refused for one moment to entertain. I suppose she was trying to work upon my feelings when she told me that Renaud was

threatened with consumption, that she had a small family to bring up, that times were hard, and so forth."

"You could not, then, grant her the favor she asked?" chimed in his wife.

"By no means. It would be entirely contrary to the rules of business to which I mean to adhere. But do not let us trouble ourselves about the matter. Those people are always trying to impose upon the credulous, and generally pay when hard pushed.—Come along, Bertha, give us a tune upon the piano to change the subject.—What a stormy night this is!"

Bertha sat down at her father's desire; but while her back was turned to him an expression of sorrow clouded for a moment her pale face, and a tear fell upon the music-sheet in her hand. In her guileless simplicity she pitied the poor mother who had pleaded in vain for her sick husband and helpless offspring.

The charming Bertha sang, in a low, sweet voice, full of expression, her father's favorite songs, accompanying herself on the piano, and restored him to his wonted good-humor.

He was proud of his accomplished child, and anxiously hoped that with the approach of spring her health would be reëstablished.

Poor Madame Renaud, on quitting the hotel, rapidly wended her way home through the storm, with a heavy heart, insensible both to cold and rain.

Resigning themselves to their lot, the Renauds witnessed their stock of books sold off at one-fourth of their value, the proceeds being barely sufficient to pay the rent falling due, and settle M. Constantin's claim.

Stripped of every thing they possessed, saving a bed, a table, and a few chairs, they removed to an attic in a wretched locality, and mingled with the poorest of the poor. Fertile in resources, like many other Frenchwomen, Madame Renaud girt up her loins for the struggle with want and misery. Being a skilful needle-woman, she sought work diligently, and found it, and thought nothing of travelling all over Paris in quest of it. From dawn till dusk, she was never idle, laboring in season and out of season without murmur or complaint, knowing that the lives of those near and dear to her depended on her efforts alone. On the miserable pittance so earned, the family were sparingly provided with the bare necessities of life. By continually imposing privations upon herself, her comely face grew pinched and wan, until she was scarcely recognizable. But the courageous woman's heart never fainted, and in the faithful discharge of her duty she found her best reward. To her husband, in the day of his prostration and affliction, she was a tower of strength; and her children rose up before her and called her blessed.

Summer came again, laden with fresh pleasures and beauties to gladden the heart of man. The bright sunshine, the green fields, the fragrant flowers, the hum of bees, the song of birds, the bleating of sheep, and the bellowing of kine, were positive sources of enjoyment—delightful forms and sounds, grateful to eye and ear.

On the banks of the Marne stood a fine old *château*, surrounded with spacious walks and stately trees, to which M. Constantin had removed his daughter Bertha, in hopes that the change of air and scenery would ward off the fatal disease that was undermining her strength from day to day.

Her cough increased in intensity with her weakness through the long summer and autumn months, and M. Constantin despaired of his darling's life. Human skill and wealth were powerless to arrest the march of the grim destroyer, and the sweet resignation of the suffering maiden was painful to behold.

To escape the early chills of winter, the family proceeded to Nice, hoping against hope that Bertha's health might be restored. A hectic flush occasionally suffused her pale face, as she looked upon the magnificence of Nature—the fertile valleys, the hoary mountains, the waving forest, the sounding sea.

Her eye of preternatural brightness looked as if kindled with the light of a purer life, while her uncomplaining gentleness would have touched a heart of stone. Her heart-broken parents now bent over her night and day, smoothing her pillow, and comforting her in her last hours.

"Father," she said, "do you remember the poor woman who sought you that stormy night, and pleaded for her husband and children?"

"I do, Bertha."

"Please give her the hundred-franc note that I got from Uncle

Eugène on my last fête-day, which you will find in my work-box."

"I will, my child."

In the early dawn of next morning, she said:

"Father, mother, embrace me. I cannot see you. I feel we shall not be long together; but we will meet again."

A few minutes afterward she breathed her last, and her spirit of innocence and purity winged its flight to the realms of peace.

The iron had now entered into the soul of the prosperous banker, and he for once realized the frailty of human nature and the vanity of worldly hopes and desires. A link was now wanting in the family chain, and Bertha's vacant chair was a perpetual *souvenir* of their loss. The father's face assumed a careworn look, and the mother's an expression of sadness. Years afterward, however, when resigned to their bereavement, they looked back with tender interest to the sweetness of Bertha's life, and fondly dwelt upon the qualities that made her memory fragrant.

In midwinter, M. Constantin, in deep mourning, was wending his way toward La Chapelle Saint-Denis, in quest of the Renauds. Their shop was occupied by a wine-merchant, who knew nothing about them. A grocer in the neighborhood informed him that they were most respectable people, and had been brought to misery through the hard-heartedness of an exacting creditor. After much searching, he finally discovered their address, and recognized Madame Renaud on the staircase before him, sadly altered, however, since he first saw her. He slowly followed her up six stairs to a narrow attic, and listened in the door-way. A racking cough plainly told what the matter was with the occupant of the bed.

"The lady I sewed so much for has not paid me, and tells me to call next week. What we must do, God only knows. I have neither fire nor food."

And her children cried for bread, while she had none to give them. A tear rolled down the banker's cheek, and he turned on his heel and rapidly descended the staircase.

On reaching the street, he proceeded to a restaurant, and ordered a savory dinner to be sent up to the Renauds. Shortly afterward, a smart boy, carrying a heavy basketful, went whistling up the same staircase, and knocked at their door.

Words cannot depict the astonishment of the forlorn family on receiving this unexpected supply, nor the happiness that reigned that night in the miserable garret.

When they had finished their repast, and were still speculating about it, M. Constantin walked in, and explained the motives of his visit. Bertha's legacy, with something added to it, he placed in Madame Renaud's hands, while to the poor broken-down bookseller he presented a check on the Bank of France for ten thousand francs, telling him he was to accept it as a loan, for which he would only charge him with interest at the rate of two and a half per cent. per annum, until he was able to refund the amount.

Prosperity again dawned upon the poor Renauds, who had been so sorely tried; and the medical skill which failed to save Bertha restored the old bookseller to health and strength.

M. Constantin, after the accomplishment of his mission of mercy, felt how much more blessed it is to give than to receive, and went down to the Chaussée d'Antin with a light heart and a good conscience.

His charity, which began at this period of his life, did not end here. Wherever human suffering was to be alleviated, he was sure to be one of the most generous and unostentatious contributors. So numerous have been the benefits bestowed by him upon the well-deserving in adversity that he is now, in his green old age, beloved and respected as "the poor man's friend."

SOUTH-AFRICAN DIAMOND-MINES.

THE diamond-mines of South Africa are beyond the bounds of the English colony of the Cape of Good Hope, and are near the junction of the Vaal and Orange Rivers, at a distance from Cape Town of about eight hundred miles in a northeasterly direction. They can be reached by a long and tedious journey from Cape Town, by a shorter one from Port Elizabeth, and by a still shorter one from Port Natal. From all these points the journey is a slow one, performed

mainly in bullock-wagons, which travel at a rate of eighteen or twenty miles a day. From Port Elizabeth it takes the traveller about ten days to reach Pniel, on the banks of the Vaal, which is at present the headquarters of the diamond-seekers.

The finding of diamonds is not, however, restricted to this particular spot, surface-stones having been found all round over a surface of one hundred and fifty miles; but the "diggings" proper are at present within a very small space, though rapidly increasing in size. On the ground all is activity, work, and cheerfulness, from early morning till late at night. The diggers have formed themselves into a "Diggers' Protective Society," and framed a set of rules and regulations, which are most strictly adhered to. According to these rules, each digger is allowed twenty feet square, and no party claims are to exceed six in number, and those claims are to be taken together. Every digger has a right of way over the claim of another to remove earth, or wash dirt, as it is called. Any dispute is brought before four assessors, appointed by the parties; and, should they be unable to form a majority, a referee is called in, whose decision is final. Should a man mark out more ground than he is entitled to, any other person may take it. Fifty feet of river-frontage is allowed to each man; but he must mark it so as to be plainly discernible at low water. If a man is absent from his claim more than three days in succession, unless his absence is caused by illness or duty connected with the claim—when he must post a notice to that effect—he will be liable to lose it. If a diamond be found on a deserted claim, it is the property of the finder; but if a man find a stone on another man's claim, and refuse to restore it, he would, on proof thereof, be considered a thief, and, after a good thrashing, be expelled the diggings. No party is allowed to employ more than five natives (or, as they are irreverently called in the rules, "niggers") to work its claim. Those who have not tools, carts, or cradles of their own, can generally manage to hire them, either at an agreed sum, or on the borrower giving twenty-five per cent. of his findings to the proprietor of the articles; but, as new hands come in, and the demand increases, terms will doubtless rise. The washing-troughs are mostly made on the ground, of yellow-wood planks, six, eight, or ten feet long, and two broad, the sides and closed end being about eight inches high. The planks, when brought on the ground, cost about one pound each. Some of the puddling-boxes have three sieves, and are on rockers, like a baby's cradle, the gravel or earth being thrown on the top one, with a couple of buckets of water poured over to separate it. The cradle is then rocked, and the contents of the sieves, which are of differently-sized mesh, carefully examined, the valuables, if any, removed, dirt thrown away, and the operation repeated. The mesh of the top sieve is about half an inch in diameter; that of the lowest sufficiently small to prevent any thing larger than a half-carat diamond from passing through it. Crow-bars for lifting and removing large stones, and rakes to sort out the smaller ones from the earth about to be washed, are necessary, as well as spades and shovels; and small light steel picks are preferred to large iron ones. Carpenters' tools are much sought after at all hours of the day or night; and but few complaints exist as to their not being returned when borrowed, the reason being, perhaps, that they are too well looked after. Carts, wheelbarrows, or indeed any means of bringing or carrying the dug earth to the river, are very scarce, and much wanted; but necessity has found a substitute in baskets, which are largely used. A consignment of either carts or barrows would bring the speculator hundreds per cent., while cinder-riddles or sieves of any kind would pay the importer well. Already there have been established a butcher's and a baker's shop, and a canteen is just opened; but we verily believe that a drunken man would be literally kicked out of the place.

One of the chief features in the place which strikes a new-comer is the honesty and sobriety of the community. Everybody's things are at the disposal of the rest, and the opportunities of being dishonest frequent, but never taken advantage of; there seems to be a total absence of selfishness; and an apparent willingness to aid and assist one another prevails, while the right hand of fellowship is extended toward every new-comer. "Loafers," of course, there are, and their number will doubtless increase; but, unless a man is accustomed to hard labor, has a good constitution, capable of enduring work in all weathers, and, above all, standing up to his knees in water at least six hours of the day, it would be better for him to find some other employment than diamond-seeking. Gentlemen-seekers are useless both to themselves and neighbors, and idlers in the way.

Loafing about the camp while others are at work is apt to lead to trouble; for, should a dog by idleness get a bad name, the diggers may be likely to prove the truth of the proverb and hang him. Many are the claimants for the actual possession of the ground on which the Campbell diggings are situated, and rumors of adjacent Kaffre chiefs coming down to take possession are often in circulation; but the diggers, as a rule, are armed with the Winchester rifle (a sixteen-shooter recently introduced by an American firm), so that any offensive demonstration from the outside of the camp would doubtless meet with a warm reception. As a rule, information at the diggings is freely given, when properly sought; but the men are only too eager to repulse any approach to inquisitive prying into their private affairs or amount of gains. As every day brings intelligence of new spots in different directions affording the precious gems, it is hard to say where the diggings will stop, what direction they may take, or what area they will eventually cover. So far the South Africas have had it all their own way; and it now remains to be seen whether the official reports of the numerous representatives of Continental and English firms dealing in precious stones will have the effect or not of causing an influx of European adventurers to South Africa. One gentleman has communicated to the house of business by which he is employed, and was specially sent to Africa, that the entire country through which the Vaal River runs is "rich in minerals," and that "gold-quartz is abundant, running in layers or strata between volcanic lava and a granite formation." Another points out a tract of country as the "richest diamond-bed known;" while quicksilver is stated as "obtainable in large quantities," and copper is said to be procurable in "any quantity."

Diamond-digging is almost as uncertain in its results as gambling. Innumerable anecdotes are related of curious luck among the diggers. One man worked over a month and found nothing. Disappointed, tired, and heart-sick, he determined, after having bewailed for some time his bad luck, to have "a last try," and almost immediately found two diamonds, one of which, to provide for his immediate wants, he sold for thirty-five pounds, but retained the larger of the two, which was valued at over twice that amount, and recommenced, as he termed it, all afresh. Another party, again, turned up two large diamonds immediately after their arrival, and in their first cradleful of earth; but, although that is over a month ago, their hearts have not been gladdened with the sight of a precious stone since; while a third more numerous and now wealthy party were early in the field, and worked hard and late without any returns, when of a sudden luck seemed to change, and they have done well ever since.

Among the diamonds that were found soon after the discovery of the mines was one of the most splendid in the world, "The Star of South Africa," a gem of the first water, weighing eighty-three and a half carats, and which has been sold for twenty-four thousand pounds sterling.

Thus far operations have been carried on at the diamond-fields in the most primitive manner. The machinery has been of the rudest and most simple character, and nothing like a systematic search by competent persons has been undertaken. Much remains to be done, but sufficient has already been accomplished to prove beyond dispute that the diamond-fields of South Africa are more than exceptionally productive. The natives residing in the vicinity of the diamond-fields are peaceful and moderately industrious, the country is free from dangerous reptiles and beasts of prey, and the climate is healthy and pleasant. The prices of provisions on the spot are moderate: bread, sixpence per pound; beef, one shilling; potatoes, two pounds per bag of three bushels; flour, two pounds ten shillings for ditto; Indian-corn, thirty shillings ditto; brandy, two shillings and sixpence per bottle; wine, eighteen pence ditto; sheep, ten shillings each; butter, eighteen pence per pound; and Kaffre-corn thirty shillings per bag. Parties visiting the diamond-fields usually lay in a stock of necessaries previous to leaving Cape Town calculated to last them during their stay in the country, and in this way are able to purchase at the most reasonable rates.

A letter-writer says that the diggers are generally successful: "There are on the fields, of course, as on Californian and Australian gold-fields, many who have got nothing. These are, however, for the most part new-comers. Indeed, it is confidently asserted that no old digger is on the fields who has not had some luck. As has been often stated by the public press, the Natal and King William's fields have been most successful. Mr. Mackintosh,

latter, very kindly gave me a sight of one hundred and twelve diamonds. One was a large one of thirty carats, for which he has refused thirty-five hundred pounds. The whole collection is valued at between five and six thousand pounds. The party numbers five, and they have been working for eight months. The first five months they got nothing to speak of, but during the last three months they have had splendid success. The Natal party have found the greatest number of diamonds, and one of their finds is a magnificent stone of forty carats, for which Captain Rolleston, the chief, was offered seven thousand pounds. These two parties had, as has been reported some time ago, their greatest success in the 'Old Kopje' (as it is named, to distinguish it from those in which the diggers are at present engaged). The King William's Town men took out one hundred and ten gems, and the Natal company one hundred and thirty-five. This kopje, Mr. Mackintosh informed me, produced at least four hundred diamonds, valued at from six to eight thousand pounds. Upward of one hundred were found in the narrow crevice formed by the junction of two reefs of rock."

Another correspondent writes: "It is astonishing the way the hills and hillocks have been turned over—some places to a depth of six feet, regularly quarried, stones now lying in heaps, piled up, or thrown into worked-out claims, giving the hills a very strange appearance. There are at present about fifteen hundred men at work, but what is found it is utterly impossible to say. We don't hear 'on the spot of half that are found. You at a distance hear of more than are actually brought to light. It is just simply conjecture as to what is really found; suffice it to say that diamonds are found every day. I have seen upward of one hundred since I have been here, no two alike. By far the prettiest is of a greenish color—a beautiful fancy gem, though not large (about two carats), still very valuable. The finding of diamonds is just simply a matter of chance and good luck. Nothing on the surface to guide you as to where to dig; just as likely to be successful on one spot as another, provided you find the water-worn pebble. It requires no amount of intellect, but any amount of muscle. Those who have been longest here, and who have the most experience, are no wiser than those that came yesterday as to where to go to work next. It is just a matter of time and perseverance. I could relate many curious instances of good luck. One must suffice. A poor man came, borrowed a sovereign to buy pick and shovel with, went to work, and in almost the first sieveful found a diamond, and has now, I believe, five in all. Of course, wherever there is a hit like that, all the surrounding ground is taken up as claims, and dug over immediately; a complete rush is made to such a locality. The usual mode of proceeding is this: a claim is marked off; pick and shovel are made to work; the ground or gravel thrown up into a heap; the large stones raked off, the other either carted down to the washing-place as it is, or else put through a fine sieve, which only allows the sand to pass. It is then washed in a cradle consisting of two sieves, the top one with holes about half an inch in diameter, the bottom one with holes that will not allow a diamond of about half a carat to pass. After being thoroughly washed, it is emptied on a table and carefully sorted and examined. The sorting is the most tedious work of all, as the sorter sits still with his feet on the damp gravel, and often he gets very cold, but then every scrape he makes he expects to turn out trumps. There are vehicles of every possible description at work from daylight till dark. No idleness here; every thing is stir and bustle. It is a rough life, and I certainly would not recommend any one to come here who has permanent employment where he is, and who cannot rough it; it is too much of a lottery. Those who have nothing, and but little to do at home, are as well here as anywhere, and perhaps better. Many have been working for weeks without success. Boats seem to pay; there is a continual traffic from one side to the other; the charge is sixpence. Immediately opposite are those who are working on the Pniel lands. I hear that more diamonds have been found on that side in proportion than on this, but smaller. There are only about one hundred men at work there. The river is about one hundred and fifty yards wide, a fine stream, not deep, and not clear, like the Orange River. The banks are well wooded, and altogether it is a pretty sight, especially at night. You may stand on a hill and see hundreds of waters below. It is altogether a peculiar scene."

in time to get something. A man arrived the other night, and, while scraping away a place to kindle a fire, found a diamond of five carats. Lucky fellow!"

Another writer expresses the opinion that the diamond-fields will give employment to at least ten thousand diggers for a hundred years to come. But this, of course, is mere conjecture, as no one at present is able to determine with certainty the extent of the diamond-fields or how soon they may be exhausted. Nothing is certain except that they have been found over a very large area at a distance of at least one hundred miles apart.

The first South-African diamond is said to have been discovered in March, 1867, by a Dutch farmer, named Schalk van Niekerk, who was struck with the appearance of a stone with which some children were playing. He showed it to Mr. O'Reilly, and, through the clerk of the peace for the district of Colesberg, it came into the hands of Dr. Atherstone, of Graham's Town. After taking the specific gravity and hardness, and testing it by polarized light, he decided that it was a genuine diamond. It was exhibited at the Paris Exhibition, and purchased by Sir Philip Wodehouse, then governor of the colony, for five hundred pounds. Professor Tennant, in June, 1868, directed attention to the Cape diamonds at a meeting of the Royal Geographical Society. He alluded to two specimens which had been purchased by Sir P. Wodehouse of Messrs. Garrard. The first is in the shape of an octahedron (three-fourths of an inch by three-eighths of an inch), of a yellowish tinge, weighing $21\frac{1}{2}$ carats. It was found near Hope Town, on the Orange River. The second is an octahedron, more symmetrical, weighing $8\frac{1}{2}$ carats, specific gravity 3.54. The professor stated that one stone was taken to a blacksmith, to see if it would resist a blow of the hammer, it being a mistaken notion that a diamond would resist such a blow. He pointed out that there are few more brittle substances in Nature than the diamond, and that a valuable stone may be seriously injured by merely falling on the floor.

In May, 1869, the magnificent diamond of eighty-three and a half carats was discovered, which has been named the "Star of South Africa." It was found by a man named Swatbooy, near Sandfontein, on the Orange River. He sold it to Schalk Niekerk for five hundred sheep, ten head of cattle, and a horse; and Messrs. Lilienfeld Brothers are said to have given eleven thousand and three hundred pounds for it. The stone was last year brought to England, and, being cut, produced a fine stone of forty-six and a half carats, valued at twenty thousand pounds. In a single year the new field has yielded more than five stones above forty carats, whereas the other localities altogether have not yielded more than one stone of that weight per annum. Professor Tennant thinks we shall have diamonds from South Africa exceeding the Koh-i-noor in size, and equalling it in beauty when cut and polished.

Diamond-merchants are in the field in force, and one firm asserts that the fields are, without doubt, the richest ever discovered. In the *Cape and Natal News* of August 8th, one party of associates is said to have sent to the coast stones to the value of twenty thousand pounds. Mr. Silverfield, of Hope Town, is said to have purchased three hundred and seventy diamonds, valued at only three thousand pounds. Mr. Mann tells us of one persevering man who worked for six months without getting a single stone, and, when about to give up, found a gem that paid him for all his labor. Another account states that Mr. Hond is known to have purchased upward of four hundred stones in six days, and one man saw sixty-three diamonds unearthed in a day at Kallenberg. In one week, seventy-five diamonds were registered by the committee. Many, of course, are never reported; but the rule is, that each finder shall take his stones to the committee to be entered in a book. Diamonds to the assumed value of fifty thousand pounds are reported to have been discovered in one week—namely, that ending August 27th. Messrs. Goodliffe and Co., of Cape Town, say they are understanding the amount when they put the total value of those discovered to September at two hundred thousand pounds. These gentlemen are convinced that the real riches of the fields have yet to be yielded to the scientific application of capital. M. Unger, of Hamburg, states that the general quality of Cape-diamonds, the result of

the washings, is superior to the stones of Brazil found at a

The general characteristics of the Cape-field

the Brazilian diamonds. Most

side of the river. An extract from the diary of Mr. G. S. Higston gives the *modus operandi* in use at the fields: "After loosening the red ferruginous gravel by means of a pick, and removing the large boulders, those who are not possessed of washing apparatus, and the means of transporting the diamondiferous soil to the river, merely pass it through a fine sieve, and then examine the remainder, to detect the precious gems. In this way many have been obtained; but as a diamond or a ruby, when covered with moist ferruginous dirt, is not easily detected, no doubt some have been passed over and thrown away among the *débris*. Washing, although requiring more hands and appliances, is, no doubt, a much more certain process. The ground is first puddled in a shallow trough, about five feet long, two broad, and six inches in depth; one man pouring water upon it, while another works it well about with a shovel. As the trough is slightly inclined, almost the whole of the sand, etc., is thus got rid of; a couple of spadefuls of the gravel is then thrown into the top sieve of the cradle (which is simply a box on rockers with three metal sieves of different-sized perforations), and while one man rocks, his assistant pours two or three buckets of water on it. By this means, the smaller stones are carried down to the undermost sieves. The rocker and his mate then examine the top sieve, which has retained all the large pebbles, and lucky indeed are they if a gem should be discovered in this, as it is sure to be one of the largest size. The second sieve is emptied out on a sheet of iron, or other sort of table, at which the searcher or searchers sit; and when all the ground is worked out of the puddling-box, the last sieve is examined for the smaller gems. At the bottom of the cradle is a small ledge, against which a little fine gravel collects, and it was from washing this *débris* in a wash-hand basin, that I was enabled to procure a minute diamond, a small nugget, and several specks of gold. I have no doubt that, on further exploration, payable deposits of the precious metal will be brought to light. Rubies are plentiful, but small; the largest I saw was between four and five carats. When a native finds a surface-diamond, he fires a shot, and hardly a day passed during my stay that one or more of these reports were not heard."

A Cape-Town correspondent of the *Times*, under date October 3, 1870, mentions a gem of pure water, octahedral in form, weighing, before cutting, one hundred and seven carats. Captain Rolleston ridicules the complaints of those who, after a few weeks' unsuccessful search at the fields, turn away, vowing there is nothing in them. He was unsuccessful for six months himself, but persevered, and ultimately secured a good reward. He thinks it useless for men to work single-handed. The captain sent a fortune home by the Saxon, and returned by the Norseman, in order to organize a company on a large scale, to prospect the diamond-fields, and avoid the short hot season. Messrs. Levenson and Goldschmidt, of Argyll Street, Regent Street, say the mines at the Cape have not produced, nor are likely to produce, any fall in the value of diamonds. These merchants state that the amount received has been much exaggerated. The value of the gems in the Norseman was said to have been eighty thousand pounds; but, when examined, eighteen thousand pounds was found to be nearer the mark. The amount of diamonds from existing mines and from private sources coming into the market, Messrs. Levenson state, is so immensely superior to any that can come from the Cape, that the latter will be lost in the aggregate. It is estimated that the value of diamonds arriving from the Brazilian and East-Indian mines is about eighty thousand pounds a month; and about the same amount is brought into the market by private holders—so that we have a total of one hundred and sixty thousand pounds' worth per month, or two million pounds a year. Messrs. Levenson state that at the Cape the smaller sizes, used chiefly in ornaments, have not been found in sufficiently large quantities. Professor Tennant says that only ten per cent. of the Cape-diamonds are of the first water.

On the 30th of July last, Commandant Parker was elected president of the new miners' republic. The president gave a ball the same evening. We are told that in August the president of the Transvaal Republic arrived at the diggings, signed the rules, and took out a claim for working.

We close the present paper with a few notes on the composition of the diamond.

Diamonds may be described as the final product of the chemical decomposition of vegetable substances. Impressions of grains of crystals have been observed on the surface of some specimens terminating fungi. A specimen in Mr. Ruskin's col-

lection shows the association of diamonds with gold found in the bed of a river in Brazil. It is a conglomerated mass of quartz pebbles, with crystals of diamond and grains of gold, the whole cemented with oxide of iron. It is curious that the primary crystal of gold is like the diamond, an octahedron. M. Rossi, of Toulon, produced diamonds by placing certain quantities of water, phosphorus, and bisulphide of carbon in a vessel which he left undisturbed for several months, and crystals of carbon were produced of minute size. The diamond is the only gem which, after long exposure to the sun's rays, becomes phosphorescent in the dark.

AMERICAN DIET AND DRINK.

BY THE EDITOR OF "THE LEISURE HOUR."

IN American diet, I did not observe many peculiarities worth noting. Breakfast is a hearty meal. The wheaten bread is good, and the corn-flour and buckwheat cakes excellent. Omelets, with chopped ham, were new to me. I saw many men commence with a whole melon, with ice in a hole scooped out—an experiment upon which I did not venture, with the thermometer above eighty degrees. Eggs were generally mashed in a large wineglass, and eaten with pepper, the waiter making the mess. He seemed surprised when I asked for a hard-boiled egg and an egg-cup—a convenience not forthcoming in one hotel. The variety of fish at dinner is great, and, in strolling through the fish-market, I wished I had Mr. Frank Buckland, Inspector of British Salmon Fisheries, at my side. The halibut, blue-fish, and lake-trout, were capital. Beef and mutton were not so good as our own; poultry abundant, and turkey at every table. Game is not scarce; and at Chicago, prairie chicken, plump as partridges. Of vegetables there was considerable variety: boiled heads of Indian corn, sweet potatoes, egg-plant, and others not familiar in England. I never saw a good mealy potato, with all the Irish in the land. They are generally served in butter-fried chips, as in France. The puddings are good, and ices better than ours. The American ladies have the "sweet tooth;" little vessels like cream-jugs, filled with syrup, are on every table, to be poured over the hominy cakes or crumpets. The ladies are also great pastry consumers. Hot rolls, and pies, as they call tarts, may partly account for the prevalence of dyspeptic complexions. A tart, in America, is our pie, though it may be as big as the real Yorkshire or Northumberland pie, covering half a table. Cheese is rarely seen at dinner, or, if used, is mixed with preserves or apple-pie. The manufacture of American cheese is for the English market, and may it increase and prosper, for the price has risen forty per cent. in my recollection.

Of the fame of American oysters I had heard so much that I was disappointed in every thing but the size. They tell of Thackeray that, on his first arrival, a dish of large "saddlebacks" was set before him. He gazed at them for some time, and then asked what he was to do with them. "Why, eat them, of course." "Oh, eat them," said Thackeray, as if a new light had dawned upon him; adding, after a pause, "Well, here goes!" When he had performed the feat of swallowing one whole oyster, he seemed stunned by his own courage, till his friend asked him how he felt. "Feel?" said he, "I feel as if I had swallowed a baby!" All oysters are not of this size, or thus treated. The methods of cooking them are countless. But the true "natives," as we get them, or used to get them, at Pim's or Lynn's or Rule's, sweet, fat little Whitstable natives, are as different from American oysters as a peach from a pumpkin. Most of them come from rough water, and have muscle and shell strong and coarse proportionally. If they were less common, they might receive more culture. Still, the oystery taste is good, whether *au naturel*, or in soup or other dressing. I found the best form by accident; asking for "fried oysters" in the *carte*, I had as good "scalloped oyster" with bread crumbs as is ever got in Old England. The average price seemed to be not much below our market-price as to number, but each fish equal to four of ours for culinary treatment, so far as material goes.

I was disappointed also with the fruit. The peaches and grapes, especially, were greatly inferior to our own. Melons and apples were up to the mark, but I remember no other fruit worthy of praise compared with our own.

Very little wine is used at table, even in private houses, though always at hand for hospitality's sake to a stranger. Lager-beer is the only cheap beverage, retailed at the saloons for five cents a glass.

The consumption is immense among the Germans. In the week the news arrived of the capture of the Emperor Napoleon at Sedan, the inland revenue issued two hundred thousand quarter-cask stamps beyond the average! The Irish get their own whiskey, dear as imported, but often produced in private distilleries. When I was in New York, a raid by the custom-house officers and police was made upon the whiskey-stills in Brooklyn, and large seizures were effected. The native whiskey, Monongahela or other, is a hard, fiery spirit. Drinking is very much confined to the bars and saloons. The number of drunkards is large, perhaps as large as in England; but there is a broader line of demarcation between the temperate and intemperate. The number of total abstainers far exceeds what it is with us, and the soaking, boozing habits of British workmen are rare in America. In every class, the progress of temperance is marked and conspicuous. The head-master of a college, a Scotchman, told me he sometimes longed for a glass of Scotch ale; but if it was known that he ordered such a thing, his influence would be at an end, as the majority of the students were pledged teetotallers. Another Scotchman, an official in a Burns Club, told me that when he first came to America, twenty years ago, "the nicht wi' Burns" was a night of whiskey and revelry. Now, the Burns Club meetings are often held in the same locality, with nothing on the table but fruits and iced water. It may not be so in New York and elsewhere; but the fact is worth recording, as indicating a change of manners. As far as I saw, intemperance in drink is not a national vice in America, although intemperance in eating is still noticeable by a stranger. I have seen Americans order a dozen dishes from the dinner *carte*, and yet drink nothing but iced water.

There was less smoking, and, to my surprise, less chewing than I anticipated. Perhaps the price of cigars has its influence on the former habit. The native tobacco is not palatable, and a good Havana is a costly luxury. The smoking-tobacco is sold in little cotton bags, fastened with a government stamp. It is dry, like the bran with which dolls are stuffed. An English smoker will find the American chewing-tobacco, moist, in tinfoil, more suited for his pipe, or mixed with the brown bran. I do not think the young Americans chew as much as their fathers. Talking with an old American gentleman in the car going to Niagara, he held a neat silver oval case in his hand. "I thought you were going to offer me a pinch of snuff," I said. He laughed and said: "I would offer you this, but I know you would not accept it," handing for my inspection his tobacco-box. The spittoon will remain ubiquitous for some time longer, in the Senate-house as well as in hotels and offices. I saw a curious notice posted in the lobby of a church in Washington: "As the seats are all free, you are requested not to expectorate on the floor." In another church, "Dirty boots and tobacco strictly prohibited." Although the use of tobacco is nationally prevalent, and the offer of a cigar, like the pinch of snuff in Scotland, or the chibouque in the East, is a sign of readiness for friendly communication between strangers, smoking is, on the whole, not so general as with us. The smoking-car on the railroads is occupied by the roughest of travellers, and in long journeys I have seen the vast majority abstaining either from smoking or chewing, which they could scarcely do if enslaved to the habit.

THE DUKE OF ARGYLL.

VERSATILITY is the characteristic of many of the English statesmen of the day. As in the era of Louis Philippe in France, men of letters now occupy high places in the councils of the British empire. The last four prime-ministers—Russell, Derby, Disraeli, and Gladstone—would be distinguished as authors had they never been ministers. Brougham, Canning, Macaulay, and Lytton, in earlier generations, won laurels as well with their pens as by their speeches and public measures. It has become fashionable for the aspirants to high political place, or the possessors of it, to acquire and display graces derived from a polite or profound scholarship. Noblemen of high-sounding names and ancient lineage have not only not disdained to follow the fashion, and to further adorn their titles by exhibiting the results of study and the fruits of learning, but some of them have entered the literary lists with an enthusiasm which is notable when we remember the repressive tendencies of ancestral pride and the enervating influences of great wealth.

The Duke of Argyll, who has the best possible reasons for family pride—for his family has for centuries been historically distinguished

as well as ancient—has added one more excellent name to the nowadays fast-increasing roll of noble authors. His literary impulses have taken a direction quite different from those pursued by his political contemporaries who are *literati*. Derby produced a rich and polished version of Homer; Disraeli grew wealthy in producing fashionable novels, the scenes of which were laid in palaces and castles, and which were otherwise devoted to laudations of the Hebrew race; Russell excelled in biography; Gladstone in classical criticism. Argyll has divided his studies and labors between ecclesiastical history and polity, geology, and the profounder problems which relate to the origin of civilization and the development of man.

He is triply renowned—as the bearer of a splendid name, as a successful statesman, and as an accomplished scholar and writer. Thus he is a type of what is best in the British aristocracy—of those nobles who, too proud to be self-indulgent and to reap listlessly the advantages which attended their birth and inheritance, and be no more in the world, leaven the whole of that decaying body by their public usefulness and private virtues.

The family of CAMPBELL has had an historical existence of more than eight centuries. Before the Crusades, or even the advent of William the Conqueror, in the reigns of the Saxon kings they were already a noted race, governing men and leading clans. In the age of feudalism they were the greatest subjects of the Scottish kings; so great as often to be dangerous, and sometimes fatal, to their liege lords. Later, the Campbells of Argyll were sometimes great ministers of state of Scotland or of Great Britain, and sometimes leaders of armies in domestic and foreign wars.

The marriage of Archibald (or, as some chronicles have it, Gillespick) Campbell with the Lady of Lochow, in Argyllshire, established the family as the Lords of Argyll. Sir Colin Campbell of Lochow, descendant, six times removed, of this patriarchal Campbell, and who flourished in the reign of Alexander III. of Scotland, and during the era of William the Conqueror, won his spurs by knightly acts of valor on the battle-field, and was the first of the family to adopt the since splendid surname of MacCallum More, which is said to mean, in Gaelic, More, the son of the Great Colin. Since then, the Earls and Dukes of Argyll, while known by these titles in London and the world at large, have always been proud, among their Highland hills, to hear themselves called MacCallum More. There have been but brief intervals, in the long period between Sir Colin and the present duke, when the representatives of this family have not been in some way making history for their race and their nation. Niel, Colin's son, was Bruce's doughtiest lieutenant, and married Bruce's sister. The first Earl of Argyll was Scottish ambassador to France and lord high chancellor in the fifteenth century. Archibald, fourth earl, the first heretic Campbell, led the Scotch Reformers in their resistance to the Established Church. The first Marquis of Argyll was commander-in-chief of the Scottish Covenanters in Cromwell's time; then declared for the Restoration, and crowned Charles II. with a vain diadem at Scone; after which he again turned in Cromwell's favor; then a third time for the Stuart when the successful restoration was accomplished. The king was, however, distrustful, and sent him back to Scotland, where he was tried for high-treason and beheaded. The second marquis was also beheaded for the same crime in 1685. The greatest, perhaps, of this remarkable family of "able men" was John, the second duke, grandson of the marquis last spoken of. He was a real soldier, valiant and keen-sighted, and was no less a bold and convincing orator. He led the king's troops against those of the Old Pretender, in 1715, dealing sturdy blows, and effectually aiding by his brilliant talents, as well as by the power of his name, in settling the Protestant succession, and in firmly establishing the German ancestors of Victoria upon the British throne. In the last century and in this the Argylls have been "Revolution Whigs," often occupying high state offices, and not seldom sitting in the cabinet. Throughout all their history we recognize a proud, high-spirited, independent, and enterprising race, standing in the advanced ranks of the civilization of their age, frank and outspoken in opinion, daring in action, impulsive—unlike the average Scottish temperament—and seldom, almost never, sinking to the level of mere stag-hunting landlords and listless, do-nothing peers of the realm. The power conferred by antiquity of name and extent of wealth, they have retained by the activity and enterprise of their individual careers.

The present duke is the eighth who has enjoyed that highest title held by British subjects, his dukedom being, however, a Scottish, and

not an English one. He sits in the House of Lords, not as the Duke of Argyll, but by his English title (conferred upon his ancestor of a century ago) of Baron Sundridge. He was born at Ardingdale Castle, Dumbartonshire, April 30, 1823, and is now in his forty-ninth year. English statesmen are not thought to have reached their official prime until they are approaching or have reached sixty. The Duke of Argyll, before he was thirty, had become a leading member of the Upper House; he was a cabinet-minister at thirty-three. In reaching so important a post, his high birth and title doubtless powerfully aided him; but it may also be said that no peer, of however exalted rank, could reach the cabinet at so early an age without individual abilities also much above the average. The duke's capacity is all the more above suspicion that it was demonstrated, and that he won wide reputation, anonymously.

His literary eminence is the more noticeable in that he did not receive the collegiate and university education enjoyed by most persons of his rank. Neither Eton, Harrow, Oxford, nor St. Andrew's, can claim him as an *alumnus*. The years of his childhood and youth were for the most part spent at Inverary and at Ardingdale. It was very rarely that he visited London, or even Edinburgh. His studies were from first to last pursued under the guidance of private tutors who attended at his father's castles, among whom was Dr. Munroe, since become a distinguished Presbyterian divine. The lot of the young noble was pleasantly cast in the lovely vales of the Lowlands, along the banks of the Clyde, in localities which might peculiarly remind him of the historical careers of his ancestry, and where his contemplative bent might have a serene and unobstructed current. His thoughts seem to have early turned to the grave subject to which he has devoted much time in his riper years, that of the Scottish ecclesiastical polity. For centuries the Lords of Argyll have been Presbyterians, and have been pillars of the state church at home and its sturdy defenders before the somewhat chilling audience of the English Parliament. Just as this scion of the house was approaching his nineteenth year, came the famous crisis in the Scottish Church, which resulted in its disruption and the establishment of a Free Church under the lead of Dr. Chalmers. In 1842 appeared an anonymous pamphlet, entitled "A Letter to the Peers from a Peer's Son," which contained an earnest and energetic appeal to that body to intervene, by legislative action, in the distracted affairs of the Church. This turned out to be the production of the (then) Marquis of Lorn. It created much discussion, and, although not achieving the object at which the writer aimed, was thought worthy of more than one vigorous answer from the solemn old presbyters of the ultra-church party. His sympathies at this time seem to have been somewhat enlisted in favor of those who threatened secession. This was apparent in a letter addressed, in the same year, to Dr. Chalmers, still further commenting on the ecclesiastical position of the moment. But further consideration induced him to abstain from following that great divine in the final step of separation, though this course was pursued by the Earl of Breadalbane, his cousin, the representative of a younger branch of the clan Campbell, and a person of superior mind and serious disposition.

The separation of the Free from the State Church took place in 1843. In the following year Lord Lorn married Lady Elizabeth Leveson-Gower, the eldest daughter of the Duke of Sutherland, and of the duchess who so long shone as the most brilliant ornament of Victoria's court. This marriage was for more than one reason an auspicious one; for it connected the heir of Argyll with the great English houses of Howard, Sutherland, and Gower, and gave him a wife whose domestic virtues and courtly graces adorned even the splendid rank of her lineage. The marquis continued to interest himself in Church affairs, writing frequently, and taking an active part in the discussions of the day.

In 1847 the duke, his father, died, and he succeeded to the title, estates, and seat in the House of Lords, at the age of twenty-four.

In the year following this event he published a work, upon which he had spent much labor, and which caused much comment and discussion, on the ecclesiastical history of Scotland, marked with the same peculiarities of earnestness and positiveness of conviction which had been evinced in previous efforts.

When he took his place among the hereditary legislators of the three kingdoms, he had an already national reputation. He was able at once to assume a position which his titles alone would not have

given. No peer so young was known so well. His opinions, on one important subject at least, were not doubtful. But his pride and ambition were not content with a laurel so little prolific in high public honors as that won by ecclesiastical learning.

His first speech in the Upper House was at once a good omen and a prophecy of his future political career; and his is one of those rare records in modern English statesmanship in which the liberal opinions embraced in the generous and hopeful years of youth have not been departed from, nor the trust in them been extinguished, as middle age has come on. He started well on the high-road of reform, and has never swerved from it. The question upon which

he for the first time addressed the peers was, whether the political disabilities imposed upon Jews should be removed. The contest was a bitter one, many Whigs joining the Tories in their efforts to perpetuate the intolerance of less-enlightened eras of statesmanship. Argyll's speech was manly, positive, and straightforward, in favor of admitting the Jews, as the Catholics had been, to political privileges. The subject of his second speech was equally auspicious; it was upon the bill to prevent bribery and corruption at elections. He also spoke—always earnestly, and seldom without winning new consideration for his abilities—on the Scottish marriage bill, on free trade, foreign relations, real-estate laws, and questions affecting the Established Churches of England and Scotland. In all these matters he betrayed the results of careful study, and of a

clear-headed acuteness which was able to seize the pith of the subjects to which he gave his attention. At twenty-five, he had supplemented his reputation as a controversialist by that of being a ready and effective debater. The Whig traditions of his family had naturally drifted him into that party; his own reason and experience have carried him beyond it into the advanced liberal ranks.

He was a consistent supporter of the Russell ministry until it broke up, owing to the dissensions between Lord John Russell and Lord Palmerston, in 1851. The Derby (Tory) ministry lasted less than a year. The Earl of Aberdeen became prime-minister in 1852, with a coalition cabinet, comprised of the Whigs and "Peelites." In this cabinet the Duke of Argyll took his place as Lord Privy Seal, at the age of thirty-three. A few years after, in relating his first impressions of official life, the duke said: "I have been deeply im-

pressed with the high character and incorruptible good faith of those public men who stand in the front rank of British statesmen. When you put the best construction on the motives of their conduct, you put that which is not only the most generous, but the most just—the nearest to fact and truth."

Gladstone was at that time ascending the "upward slope" of his fame as an orator, and his power as a politician. He was in the full ripeness alike of his physical beauty and his high intellectual abilities. The Duke of Argyll became one of his earnest disciples and followers, and has advanced side by side with him ever since; indeed, on certain occasions, the duke has proved himself even more radical than his

leader. In the Aberdeen Cabinet—which seems to have been a later cabinet "of all the talents"—Gladstone was Chancellor of the Exchequer, and Sidney Herbert, Sir George Lewis, and other intellectual lights, were among his colleagues. The duke continued to be Lord Privy Seal until 1855, when the Aberdeen ministry was voted out of office on a question relating to the Crimean War. Lord Palmerston, who succeeded to the premiership, transferred him to the less ornamental, but more responsible, and to an ambitious statesman more desirable, place of Postmaster-General, when Lord Canning was appointed Governor-General of India. Three years later, the Palmerston ministry fell, and the duke retired to the "cold shade of the opposition benches" during the brief period of the second Derby ministry. The Liberals, however, held the mandate of the country,

as they really had held it ever since Sir Robert Peel's conversion to free trade, and his resignation in 1846. Palmerston returned to office as a result of the general election of 1859, and Argyll was restored to the Privy-Seal office, which he held, with another brief tenure of the Post-Office intervening, until the defeat of Earl Russell (who had become Premier after Palmerston's death in 1865) in June, 1866. During this long official life, Argyll's opinions steadily advanced with those of the more radical wing of his party. At Liverpool, on one occasion, he declared himself in favor of a much wider extension of the suffrage than any Liberal leader had hitherto dared to confess. There were now and then questions on which Liberals were divided; on which the more timid hung back; which some thought "leaps in the dark." But the Duke of Argyll on all these took bold ground in favor of the most advanced ideas; and never hesitated once to cham-

THE DUKE OF ARGYLL.

pion the cause of reform, whether industrial, political, or social. The Russell reform bill was moderate, and intended to conciliate the more conservative Liberals, while it partially satisfied the advanced wing of the party. Argyll energetically sustained it, as he undoubtedly would have sustained a much broader measure. But the Tories were oblique of vision, and, aided by Liberal renegades, voted down a detail in committee. Derby and Disraeli succeeded the veteran Earl Russell, were forced to bring in a much more sweeping suffrage bill than that they had defeated as revolutionary, and, having done radical work to spite the Whigs, were ignominiously thrust out of power by the exciting elections of 1868. Earl Russell, being politically *passé*, Gladstone gracefully bowed Disraeli out of the premier's chair.

The new cabinet for the first time admitted to the royal councils the distinctly radical wing of the Liberal party, John Bright and William Page Wood, life-long advocates of household suffrage, taking seats beside Gladstone, Granville, and Argyll; and Forster and Stansfield, the last the friend of Mazzini, being appointed to subordinate ministerial offices. The Duke of Argyll was designated for promotion, and became Secretary of State for India, a much more distinguished post than those which he had previously occupied; and one which, at present writing, he continues to administer with signal ability. To his management are committed the vast interests of the Indian empire, and the welfare of a race far more numerous than that inhabiting the British Isles.

Not less interesting is the duke's career as a thinker and writer, than as a statesman, during this period of high and almost continuous political honor. At thirty-three, he was unanimously chosen Chancellor of the Scottish University of St. Andrew's; three years later (in 1855) he was installed as Lord Rector of the University of Glasgow. Both honors were conferred in recognition of his learning and his devotion to the interests of the Church, and in spite of his never having been educated at any public institution.

Soon after, he seems to have turned his contemplations into the channels of physical science, which powerfully attracted his vigorous and searching intellect. He appeared several times before the British Association, and read papers embodying the results and conclusions of his scientific research. The special branches to which he devoted himself were the history of the human race, and geology. He delivered a series of remarkable lectures on the latter science before the Glasgow Athenæum, in which he endeavored to harmonize geological developments with the Christian faith. Indeed, his enthusiasm for scientific progress, and his zealous sympathy with every effort of men to penetrate to the still veiled mysteries of man and Nature, have never been dampened by his yet more earnest devotion to the faith of the Bible; for his creed, though orthodox of the orthodox, is not of that fearful and halting nature which fears the result of greater light, of a clearer view of natural truths.

He pursues science because he believes that its unravelled secrets will be but new testimonies to the great first cause. In 1868, he read a paper before the Geological Society on the physical geography of Argyllshire, in connection with its geological structure. In this he combated previous geological conclusions, and contended that the hills and valleys of that region had been in the main determined by subterranean forces. As president of the Royal Society of Edinburgh, he criticised Darwin's "Origin of Species," concluding that "Creation, of which we talk so easily, is a work of which we have no knowledge, and can have no conception." This, and other addresses and essays on kindred topics, are published in a volume entitled "The Reign of Law," which is as well known in this country as in Great Britain. Another work of a similar kind, "Primeval Law," is equally widely known, and these two works abundantly attest the duke's careful research, clear reasoning faculty, and bold, vigorous style. In the former, he reaches the conclusion that "creation by law, evolution by law, development by law, or, as including all those kindred ideas, the reign of law, is nothing but the reign of creative force, directed by creative knowledge, worked under the control of creative power, and in fulfilment of creative purpose."

His conclusions also relative to the origin of civilized society are marked, and in bold contrast with those of Darwin and of his disciple Sir John Lubbock. The latter records his belief that "the primitive condition of man was one of utter barbarism;" Darwin thinks of utter bestiality. Argyll argues that that primitive condition was one of civilization; that "man, even in his most civilized condition, is

capable of degradation; that his knowledge may decay, and that his religion may be lost."

I can but glance rapidly at the duke's labors and conclusions in the field of science, much less comment upon them; but it is already seen that he is a sturdy champion of that view of scientific discoveries which is reconcilable with the Scriptures, and even confirmatory of them, as opposed to the view which would regard Nature as the challenger and contemner of revelation. Besides the subjects of ecclesiastical polity, geology, civilization, and politics, the duke has been a student of social science, and an earnest worker in the cause of general education.

Inverary Castle, the hoary ancestral home of the Lords of Argyll, has often been thrown open in hospitable welcome to men and women famous in the paths of literature and of science. Prescott, accompanied by Sir Roderick Murchison and Professor Sedgwick, visited the castle in 1850; Mrs. Stowe was later a guest there; Baron Bunsen, and other Continental diplomats and scholars, have experienced its luxurious comforts amid a nobly-rugged landscape and teeming historic memories. Bunsen says, writing from Inverary: "I am lodged as in a royal residence, with a fine area of the sea, and the nobly-wooded hills around me." The queen visited Inverary on one occasion, and, in her "Highland Journal," speaks of seeing there the infant Marquis of Lorn, who was afterward to become her son-in-law.

In person, the duke is short and robust, with an inclination to stoutness. His form is straight, and his head, with its abundant crop of golden hair brushed up and back from the forehead, is held haughtily high in air, while the face is a proud but very kindly and expressive one. His features are regular, the nose being straight and standing prominently out, the mouth firm and even, the chin round. In one feature—his forehead—he resembles the portraits of many of his ancestors; it is very high and gently receding, and this peculiarity is seen in almost all the Dukes and Earls of Argyll. The face is long, so a true Scotch face. As a debater, the Duke of Argyll has none of those impediments, either natural or assumed, which mar the declamation of so many Britons. The words come clearly and quickly, and his earnestness hurries him on in a bold and straightforward delivery, which admits neither of hesitation nor of the studied graces with which many orators of the day still love to adorn their addresses. Though a man of learning, he is seldom pedantic in speech; but some one says of him that, when he speaks in the House of Lords, he has the air of a school-master lecturing his scholars. There is, indeed, something of this kind in his manner at times. His impetuosity not seldom leads him into sharp forensic encounters; for he is very jealous of the honor of his colleagues, his party, and his ideas, and hotly resents attacks on either, trusting to the temper of his weapons as, on the spur of the moment, he clutches them up. He is not a great statesman; but he is a faithful and able administrator, and an honest worker. He is not a great orator; but he is an excellent debater, and has no superior in the Upper House, in the lucidity of his ministerial statements and the conduct of a controversy upon the measures within his ministerial province. It is gratifying to be able to add to this sketch of his career and public character, the fact that his private virtues are conspicuous, and that his reputation as a high-minded, honorable, benevolent, and amiable gentleman, is not surpassed by that of any British public man. It is equally gratifying to close by saying that the Duke of Argyll was, from the beginning of our civil war to its triumphant close—through all its periods of gloom, of depression, and of apparently impending failure—the constant friend of the Union cause, often standing up in the Peers, before an audience overwhelmingly hostile to the Union, and pleading its right, while eloquently warning them of the shortsightedness of England's policy.

GEORGE M. TOWLE.

THE PALISADES.

THE Palisades of the Hudson, of which we give a general view on the first page of this number of the JOURNAL, are described by Mr. Lossing, in his "Book of the Hudson," as portions of a ridge of trap rocks extending in an unbroken line along the western shore of the Hudson, from a point just above Weehawken to Piermont, and irregularly to near Haverstraw. These rocks present a rude, precipitous

front, from three to five hundred feet in height, forming a mural escarpment, columnar in appearance, yet not actually so in form. They have a steep slope of *débris*, which has been crumbling from the cliffs above during many centuries by the action of frost and the elements. The ridge is narrow, in some places being not more than three-fourths of a mile in width. It is really an enormous projecting trap-dike. On the top, which is a level table-land, and among the *débris*, is a thin growth of trees. On the western side of the range the slope is gentle, composed generally of rich soil and covered with trees.

Viewed from the river this range is monotonous and forbidding, and the traveller can scarcely imagine that behind their frowning front is a fertile and smiling country. The view in our illustration is from a point near Dobb's Ferry, on the eastern shore, just below the break in the range at Piermont.

AUGUSTE BLANQUI.

IN the latest and most melancholy phase of the French revolution which began with the fall of Napoleon III., one of the turbulent spirits of other days has arisen and now dominates the capital. Auguste Blanqui controls that inner committee, which moves the central committee, which in its turn governs sternly the commune.

It is noteworthy how many of the republican leaders have issued from the better classes of society; how few are self-made men, rising from the lowest strata—Robespierre, Barère, Desmoulins, in the old Revolution of 1789-'93, belonged to what the English would call "county families;" Mirabeau was the scion of an ancient and noble house. In the Revolution of 1848, Victor Hugo, Lamartine, Louis Blanc, Ledru-Rollin, Crémieux, Garnier Pagés, Arago—indeed, all the government, with the conspicuous exception of Albert the Laborer—were what is in countries with social grades called "well-born." In the present revolution Favre, Rochefort, Flourens, Simon, Picard, are men of social rank; Rochefort is noble, and Flourens the son of a member of the "Forty Immortals"—the Academy of France.

AUGUSTE BLANQUI may be ranged in the same category. His family was of the "highly-respectable" sort. They were well-to-do people at Nice, and Auguste received a more than liberal education. In his early years he was already distinguished for the graces of a polite and even profound scholarship. He at least exemplified in his own person no grievous wrongs, no aristocratic or kingly tyrannies. With a different temperament he might long since have sat in a *fautuil* of the Academy beside the father of his colleague, Flourens, and his antagonist, Thiers. After leaving the Lycée and college, he became a private tutor in a rich southern family, varying this occupation by giving occasional lectures on the classics—notably on Horace and his odes—at Nice and Marseilles. So he was engaged, with every anticipation on the part of his friends that he was fast winning his way to a professorship and a distinguished career in the avenues of learning, when the stirring political events of 1828-'29, foreshadowing the overturning of the restored Bourbon monarchy, diverted his attention. He is described, by one who wrote of the "Men of 1848," as being, in his twenty-fifth year, a taciturn, sallow, dark-eyed youth, with close-cropped brown hair, almost clerical in dress, and, when speaking, speaking with a "sharp and short dogmatism" which may be observed as a prevalent characteristic of French school-masters. He had been radical ever since his accession to the years of manhood. But it was remarkable that Blanqui, unlike almost every other French agitator of distinction, and especially unlike those born in the hot provinces lying on the Mediterranean, was little imaginative—that he dealt little in the use of oratory, and was wanting in the flourish and *élan* which so captivated, and still so captivates, a French mob. His power was none the less real and constant. Polignac's policy, which had in view the gradual abrogation of the famous charter by which Louis XVIII. was vouchsafed by his people a comparatively peaceful reign, fired the hearts of the French republicans, to whom, indeed, it was a very god-send. This quiet, reticent, private tutor seems to have caught the infection, for, as events became grave, and revolution threatened afar, he threw aside his books, bade adieu to Horace (as a medium for bread-getting) forever, and started for the centre of action.

From that day to this, Blanqui's career has been stormy, full of romance and vicissitude; and, if his name has been less often in the mouths of fame and rumor than many others with whom he has acted, it is because he has been rather an actor in confused times and events than, like Louis Blanc, an orator, or, like Flourens, a soldier. For more than forty years he has alternated between the dictatorship over a mob, and the punishments inflicted by monarchy, republics, and empire. And now, at sixty-six, with parched and wrinkled sallow face, sunken eyes, stooping shoulders, and grizzly head, but yet dauntless spirit and sinewy frame, he once more enacts the part wherein he is "himself again"—as the power behind the wall, which moves, as by wires, the players outside it. He mingled in the Revolution of 1830, and therein sat in one of the club-rooms with two pistols at his side, issuing orders to be executed at some barricades in the street below. But the Revolution of 1830 took an anti-republican turn; Thiers was responsible, for it was he who turned the channel of insurrection and gave it a king. Many republicans submitted; Blanqui did not. As one of the extreme irreconcilables of the day, he at once set to organizing secret clubs; and, by his strange, quiet force of character, infused a large body of Parisians with his own courage and his own intense hatred of all conservative forms of government. He permitted but one year of peace to the citizen-king, when he planned an insurrection which, on the eve of becoming itself a revolution, was suppressed, and its leader arrested. Blanqui was sentenced to imprisonment for life—"if the government lasts so long," said he, adding to the judge's sentence as he passed out of court with a quiet, sneering smile. After two years spent in prison, where, it was observed, he seemed to give over political cogitations and took to reading the Roman historians, the government pardoned and set him free. It was always the Orleanist policy to be gentle with political offenders; this was forced upon the monarchy by the memory of its own origin. Blanqui tried his hand at writing in the anti-dynastic papers, but that was not his forte. He seemed always to retire, as it were, behind the editors and orators, and to be telegraphing to them with his eyes what tack to take. In the clubs he was still probably the most powerful man in Paris. One source of this power undoubtedly was, that no one suspected his political faith. If ever there was in France a socialist republican "pur et simple," Blanqui was and is one. If the mantle of Marat has fallen on any shoulders, they are his. Then his courage was perfectly demonstrated. It was not of the loud and ostentatious kind common to French agitators; his courage was placid, unyielding, even. He never blundered at any venture, and never fled before any odds. The next insurrection of which he was a moving spirit was that of 1839, when, his military leaders having stormed and taken the Hôtel de Ville, the Place de la Bastille, and the whole upper end of the Rue de Rivoli, he came down quietly and sat in consultation at the first-mentioned place, and all but established, over half of Paris, a pure socialism. This, however, also failed; shortly after, he was arrested in Paris—though he might have been, had he chosen, out of France—and now, as utterly contumacious, was sentenced to death. Once more he became the subject of royal clemency, and the sentence was changed to a life-imprisonment. Shortly before the Revolution of 1848 he was pardoned, as a necessity; but even conciliatory acts like these did not avail to preserve the throne. On the formation of the Provisional Government, Blanqui once more became a hero of the clubs; but two months had not passed when he discovered that the new executives were "conservative," their policy "reactionary," and their end "treason." He was a chief in the insurrection of June, and the republic, ungrateful to this Simon-pure republican, sentenced him to ten years' imprisonment on Belle Isle—the famous island which Fouquet, in the old times, fortified, so that he might resist the tyranny of the grand *monarque*. He tried to escape, but the island-fortress was too well guarded. After his release he went into exile, and nothing more was heard of him till, on Napoleon's fall, he hurried back to Paris, there to resume his old influence in the midnight Jacobin meetings.

Blanqui, at sixty-six, is a man of singular energy, and is as bitterly, intensely radical as at twenty-five. He is at the extreme of the extremists. His presence signifies constant turmoil and insurrection. If he achieves the power he aims at, the guillotine will be set up again, and the Reign of Terror will once more be resumed. Rochefort and even Flourens are mild political trimmers compared with him. It will be an evil day for France should the insurrection triumph, and this arch-agitator and arch-Jacobin sway its victorious counsels.

FRAGMENTS OF TRAVEL.

WITH ILLUSTRATIONS BY F. O. C. DARLEY.

VENICE AND THE GRAND CANAL.

WINTERING in Florence is by no means so charming as most travellers would lead us to suppose, and I sincerely advise all invalids to beware of the fearful north wind which blows over the snowy shoulders of the Apennines, and during the winter months causes a most uncomfortable sensation, to say the least of it, often reminding me of our own miserably chilly March winds. Many a time, when walking over the stone slabs with which the streets are paved, have I shudderingly buttoned up my coat, and thrust my benumbed fingers into my pockets, almost envying the good people their *scaldini*, the little earthen vessels, filled with hot ashes and burning charcoal, with which almost every man, woman, and child, seems to be provided. But Florence, in the early spring, with lovely roses climbing her garden-walls, with her luxuriant foliage, her orange-groves and myrtle-bowers, her marble palaces, her statues, fountains, cypresses, beneath the warm sunlight and clear blue sky, is a very different thing, and makes Florence la Bella worthy of the name.

Her streets are well paved, clean, bright, and cheerful, and are generally filled with a constantly-changing concourse of people, among whom there is by no means the same appearance of poverty and wretchedness as is to be met with in either Rome or Naples. Food of all kinds is so marvellously cheap that cases of actual starvation must be rare indeed. Quantities of chestnuts, luscious figs bursting with ripeness, blooming peaches, and magnificent grapes, may be bought for a mere trifle. I have often seen the dirtiest little specimens of unwashed Tuscan youth fairly revelling in the possession of huge bunches of grapes worthy to crown the brows of Bacchus himself. My picturesque friends, too, the beggars, are not half as numerous as they are in most Italian cities. Indeed, I quite missed their fantastic shreds and patches, their strange contortions and pleading cries, their piteous "Give me something for the love of God—I am dying of hunger!" dwelling on the last words with a heart-touching pathos that, when heard for the first time by the inexperienced traveller, seldom fails to awaken the charity that thinketh no evil.

Surely these pertinacious unfortunates have an especial claim upon

the artist, who so often finds invaluable studies among their tattered draperies and patriarchal beards. Who can say that the magnificent fell of hair that flows over the mighty chest of Michael Angelo's "Moses," did not find its original in the possession of some picturesque vagabond of the great Buonarrotti's time? We are all familiar with the ugly story with which history has blackened the memory of Giotto, who, when painting the martyrdom of one of the apostles, discovered an admirable model among these miserable beggars, and is said to have tortured the unhappy wretch to death, with savage enthusiasm, that he might the better portray the dying agonies of the saint.

One of the features peculiar to the streets of Florence is the flower-girl, whom you are sure to meet on the Lung Arno, or in the Cascini; which, in fine weather, are always filled with handsome equipages and throngs of people. The name of flower-girl is undoubtedly suggestive of something pretty and youthful, fair of form and light of step, her breath scenting of new-mown hay, and her whole person redolent of the lovely blossoms which fill the basket she carries in her hand. Perhaps you see one of these damsels in the distance, and are naturally anxious to obtain a nearer view. There is nothing very striking about her dress; she wears a broad straw hat, whose "shady brim" doubtless conceals "the blush that, in the midst of brown, was born." As she comes nearer, you see her entering the *cafés*, where you imagine her gracefully presenting her floral treasures, and whence she emerges, perhaps three or four *centesimi* the richer. She continues to approach, though her figure is occasionally lost among the people and vehicles that throng the street; again you see her, stopping for a moment to gossip with some friendly chestnut-roaster or purveyor of pumpkin-seeds, with whom she is possibly effecting an exchange of property. In another moment she has darted off in the direction of a group of *forestieri*, each of whom, when they soon after pass you, carries a tiny bouquet of rosebuds at his button-hole. Before you have time to think how very charming is this pretty little piece of attention, and how characteristic of her graceful country women, two coarse brown hands are busily insinuating a small knot of sweet-smelling violets into one

of your own button-holes, while beneath the shady brim of the broad straw hat—now within an inch of your amazed countenance—appears the dark and wrinkled visage of a matron of some forty summers.

This, by-the-way, reminds me of a droll story I heard while in *La Bella Firenze*, told to me by its hero, "a fellow of infinite jest," whom I encountered at our hotel, and toward whom I was much attracted by his genial and gentlemanly address. He had a fund of anecdote and story, and a manner of relating his experiences of which it would be impossible to convey an idea; and was, altogether, so agreeable a companion that we all regretted his departure from Florence, which took place soon after our arrival. The adventure occurred in Venice:

"I reached the Silent City," said he, "at night, stopping at the bustling, noisy railroad station, which might have been in England, or America, or anywhere else, so utterly commonplace was it, so altogether different from what the mind is prepared to find on approaching the gorgeous city of historic splendor and romance. I had been suffering from headache almost ever since I left Padua, and now found myself slightly feverish, and far from being in a proper condition to appreciate the strange, mysterious beauty by which I was surrounded.

"Every traveller tells you of the wonderful effect of the brilliant lights dropping in golden streams into the watery way as you glide noiselessly along in the low, black, hearse-like gondola between

tall and stately palaces; not a breath, not a sound, meeting the ear, save the silvery plash of the oar, or the occasional warning voice of the gondolier as other dark objects silently pass by—how you turn out of the grand canal into some smaller channel, and find yourself gliding beneath bridge after bridge, lonesome, sad, and dark; only an occasional light showing itself here and there, serving to make the shadows more profound, until your silent boatman suddenly stops at the ample door of one of the melancholy-looking palaces, and tells *il signore* that he has now reached his hotel; as did my aquatic friend, on introducing me to the B—.

"I need not say how glad I was to rest my wearied body and aching head in the spacious and comfortable apartment to which I was shown, though my feverish brain soon became the playground of the most extraordinary and painful dreams, wherein all manner of malignant tyrants and mischievous water-sprites combined to make night hideous. At one moment I imagined myself the victim of some terrible conspiracy; was tried, condemned, strangled, and thrown into the canal; at another, the windows of my room—apparently besieged by an army of gondoliers, who seemed to be battering on the shutters with their long oars—were furiously burst open, and suddenly a foaming torrent would pour into the apartment, rise in the form of a bubbling fountain at the foot of my bed, nodding its plumed head as if swayed by the spirit of some fair Undine; then as suddenly descend in an overwhelming shower—icy cold as Dante's frozen lake—on my helpless, unoffending shoulders. This pleasant state of affairs must have continued not only for that night, but for many other nights and days; for, when I next awoke to consciousness, I found myself free, indeed, from pain, but weak and

THE FLOWER-GIRL.

A DEMONSTRATION.

A DISCOVERY.

powerless as a little child, and doubtless with the same desire—if any one in such a condition of body can be said to have any thing that argues the possession of a desire—to be soothed and quietly talked to; to be helped to disentangle the curious, dreamy recollections that were gradually coming back to my brain of the many lands in which I had been wandering, and to account for the condition in which I found myself in the mysterious Silent City.

"I suppose the effort I made to speak aroused the attention of two persons who were in the room, one of whom came softly to the bedside, and, with an expression of pleased surprise, leaned over me, felt my pulse, and, said in a low voice and in excellent English:

"Do not exert yourself to speak, you have been very ill, but will now recover rapidly. I am your physician."

"After staring up at his kind, benevolent face, for some minutes, with, I am quite sure, a look of remarkable penetration—

"Have I been wandering, doctor?" I asked.

"You have been suffering from a violent fever for two weeks, and, of course, you have not always uttered the profoundest wisdom, as you may suppose. But you are all right now. Skin moist, pulse calm and regular, head cool—"

"Head cool!" I repeated, slowly raising my hands to my forehead. "It does feel cool, doctor, but what—what is *this*?" I tremblingly questioned, as, in passing my fingers beyond my forehead, they came in contact with a smooth and slightly downy surface, suggestive of the head of an infant of the tenderest age.

"My dear sir, you must not be so curious," he gently answered. "In a day or two you will be strong enough to ask as many questions as you like, but just now all you have to do is to keep yourself as quiet as possible, and—"

"Shaved, doctor, shaved, I know it, I *feel* it!" I groaned, feebly clutching my denuded cranium, once the proud possessor of raven locks that might have rivalled Absalom's.

"The excellent medico's predictions with regard to my returning health were quite correct, for, thanks to his unceasing care, in less than two weeks I was almost myself again and in the possession of a most fascinating wig, the daily arrangement of which, during my convalescence, afforded me infinite amusement. I don't believe that I am the ugliest fellow in the world, and, when crowned—but I will not anticipate, my wig shall speak for itself.

"While in a convalescent condition, and yet under the dominion of Dr. Niccolo and beef-tea, I used to pass an hour or two every morning at my window, which did not overlook a canal, but one of the *campi*, which at that season of the year—it was early spring—are always swarming with busy traffickers, venders of fish, flesh, fruit, and fowl, who fill the air with their vociferous cries.

"Though I seldom failed to find amusement among the droll scenes that were continually taking place among all these busy people, yet I soon found better occupation for my eyes in the balcony of an opposite palace, which soon became decidedly interesting.

"One morning, just after I had taken my usual place at the window, with a remote idea of looking over one of Balzac's stories, some movement caused me to look in the direction of this same balcony, from which, at the moment I raised my eyes, a female figure quickly withdrew into the room beyond, but not so quickly as to prevent my observing the somewhat unusual but pleasing combination of dark-brown eyes and very light hair. Of course, it was the most natural thing in the world for me to look in the direction of my fair neighbor the next day, and the next, and the day after that; and there she was sure to be, and, what soon became quite exciting, was equally sure to disappear as rapidly as on the first occasion.

"After a time this pretty timidity, or whatever it was, began gradually to wear away, so that she would sometimes linger for a few moments, leaning upon the balcony in a graceful attitude, with a cunning little knot of scarlet flowers in the bosom of her light-blue dress; or she would bring her pet bird and hang its gilded cage in the warm sunlight—no doubt using sweet Italian terms of endearment as she did so—of course, quite unconscious of the pale, sentimental stranger at the opposite hotel-window.

"I have no doubt that I looked extremely interesting; indeed, I have often thought so while making my morning-toilet, as I beheld myself reflected in the mirror, with my ghastly visage and great gray eyes, to say nothing of the crowning glory of that superb black wig, which was so decidedly becoming that I began to think of adopting it altogether.

"Sometimes for a whole day I was only permitted to behold my fair Venetian's blue drapery flitting within her own apartment; then again, as if irresistibly attracted, or from an amiable desire to afford the lonely invalid, '*il povero ammalato*,' the sight of her own pretty face—for by this time she had become quite conscious of my neighborhood—she would bring her work-basket and busily employ her taper fingers in arranging the bright colors it seemed to contain.

"What harm if, while so employed, a bright glance and still brighter smile were sometimes sent in my direction? What harm if, as she rose to go, she sometimes turned and kissed her pretty hand? Poor girl, the artistic flow of that immaculate wig was rapidly doing its work!

"For a day or two I refrained from going to my window, and, when I again did so, kept my eyes most determinately fixed upon the passers-by below—upon the citizens, soldiers, and sailors, in their various costumes, gossiping in the warm and cheerful sunlight, or upon the idlers about the *cafés* and shop-windows—but it was all in vain; my wandering glances gradually returned to their allegiance, and fondly came back to their familiar resting-place. There stood the signora, talking to her canary, which seemed to be enjoying the lovely spring morning in an ecstasy of song, while its fair mistress hung flowers about its golden-wired cage, apparently as bright and happy as her feathered pet. In another moment she saw that I was looking at her, and, leaning upon the balcony, took a rose from the flowers in her hand, and, while the sunlight sparkled in her soft, light hair, slowly plucked its leaves, letting the velvet petals fall below.

"Did I fancy that, while thus gracefully occupied, the softest glow suffused her cheek? or that, as each leaf slowly fluttered to the ground, her lips were gently murmuring some tender enchantment?

"Now," thought I, 'this charming creature is gradually taking my reason prisoner, and, instead of being allowed to continue my travels with renewed health and vigor, if I am not careful I shall be thrown back upon the good Dr. Niccolo's hands with an aggravated case of disease of the heart.'

"As I leaned back for a moment to reflect what was the best thing to be done, whether to change my hotel or only my room, my glance chancing to fall upon the mirror, I beheld what I firmly believed to be the cause of the fair Venetian's delusion, the immaculate wig, in whose magnificent locks, as in those of the Hebrew giant, lay all my strength.

"It shall be done!" I mentally ejaculated, 'though at how great a sacrifice! The end must justify the means.'

"Then coldly and deliberately rising from my chair, at the very moment she had dropped the last leaf from her white fingers, with her soft cheek all aglow from the apparently-happy result of her little incantation, and her smiling brown eyes timidly looking into mine, I desperately seized the ambrosial locks and held them high in air above my denuded poll!

"Imagine, if you can, her start of horror, her sudden change of expression, from blushing happiness to pitiable bewilderment and utter disgust! She stood for a moment perfectly motionless, as if totally unable to realize her situation; then, clasping her hands before her eyes, as if to shut out the fearful sight, rapidly retreated to her apartment. The remedy was effectual, for I have never seen my pretty coquette since; and so ended the amusing little episode, to which, I must confess, I have often looked back with a feeling of regret, slightly tintured with remorse."

Memorandum in my journal runs thus: "Should we go to Venice, must not fail to look out for the Hôtel B—."

If any one has a desire to see the *élite* of Florence society, let him go to the Cascini, which lies just beyond the city-wall, along the Arno. On Sundays and fête-days you will find a capital band there, which all the world turns out to enjoy. The grounds in fine weather are always sure to be filled with countless promenaders, male and female equestrians, handsome open carriages, filled with elegantly-dressed ladies, and drawn by superb horses. The band is generally stationed in a large open space, which seems to be the chief point of attraction, for here generally assemble the great mass of vehicles, whose occupants keep up a lively interchange of compliments and other small talk. Here you have an admirable opportunity to study the graces and beauty of the fair Tuscans, who most amiably do every thing in their power to gratify your curiosity. The arrangement of a shawl, the readjustment of a stray curl, or the pulling off of a glove, may

each involve a variety of easy and graceful movements, as well as the momentary display of a fine bust, a white throat, or a dimpled hand.

All this charming coquetry, however, is by no means confined to the Florentine dames, who are really almost outnumbered by the everlasting tourists, French, English, and American, who are conspicuous everywhere upon the Continent, more especially in Florence the Beautiful.

From the heights of Fiesole, you have a most lovely and extensive view of the valley of the Arno, where lies Florence with her stately domes and towers, her splendid churches, and Giotto's Campanile. Hills covered with olives, myrtles, and climbing vineyards, gently slope to the greenest of green valleys, watered by the broad and sinuous Arno, on whose banks gleam the white walls of countless villas, "bosomed high in tufted trees." Imagine the mellow tints of the distant Apennines as a background to all this luxuriant loveliness, and you have a most charming picture, on which the eye is never tired of gazing, and which the mind delights to recall when far away.

There is another magnificent view from Galileo's Tower, or Observatory—for it is said that here he used to study the heavenly bodies. As we slowly ascended its three stories, I could not help recalling the words of the enlightened Holy Fathers when the learned philosopher first appeared before the Court of the Inquisition at Rome.

"Firstly," said the Holy Fathers, "your doctrine of the sun being in the centre of the world, and immovable, is absurd in itself; secondly, it is false in philosophy; and, thirdly, it is damnable, as being contrary to the Scriptures. And, again, your doctrine that the earth is not the centre of the world, nor immovable, is, in the first place, absurd in itself; in the second place, false in philosophy; and, in the third place, an error, to say the least of it, in point of faith."

A great number of the inhabitants of Fiesole employ themselves in plaiting straw, of which they make a profitable trade by sending the products of their industry to various parts of the world. Scarcely had we entered the town when we were beset by a crowd of these importunate straw-merchants and their families, who fairly drove us before them, wildly imploring us, in the most frantic manner, to purchase their bundles of braids and straw birds with impossible heads and tails. The enormous amount of gesticulation the Italian people bring into play on all occasions is really wonderful; among the Neapolitans it is especially observable.

While passing through one of the streets of Naples—or on the Molo, for example—stop for a few moments to observe a group of fishermen; hear the incessant chatter of their voluble tongues; how heads wag, eyes flash, and teeth gleam; how arms are thrown into the air, and fists become so powerfully active that you look momentarily for the glitter of the sharp knife which all these men wear, and

fear the whole thing is about to result in a general battle. Now, were you near enough to overhear the subject of their conversation, you would probably find that this immense amount of vital energy was being expended on the friendly recital of some successful piscatorial adventure.

To witness the passionate warmth of their religious feeling is sometimes almost painful; often, while standing in one of their magnificent churches, lost in admiration of the resplendent marbles, mosaics, gilded shrines, crucifixes, paintings, images, and glorious stained-glass glowing with gorgeous color, your attention will be startled by the sudden entrance of an apparently-frantic female, who throws herself prostrate upon the marble pavement, as if in a despairing condition of mind; you observe another fervently kissing the feet of an image, perhaps bathing them with her tears; while a third is upon her knees before some distant saint, whose marble drapery gleams through the uncertain light.

Before leaving Florence we did not fail to pay our devotions to "Dante's Stone," whereon, it is said, he was wont to sit for hours in mournful meditation. My mind's eye readily conjured up the thin, dark-robed figure, the sallow and somewhat saturnine visage looking as if no cheerful thought had ever visited his brain, or smile parted his thin lips.

Of the picture-galleries I will say nothing. A mere catalogue of pictures, which is all that I could pretend to give, can be found in the guide-books; but art criticism should be left to connoisseurs.

On our way to Venice we stopped at Padua, a rare old city, suggestive of much learning and stateliness. Its streets have a gloomy aspect, owing to the broad arcades on each side, supported by massive pillars, which, in fact, make the whole city, as some traveller says, look like a cloister.

The Brenta is a decidedly slow-moving and uninteresting river, and without a particle of beauty to recommend it to the most enthusiastic traveller. The country gradually becomes nearly as flat as Holland, but well cultivated, with fine green meadows, abundance of olives, and, now and then, long rows of poplars. But something tells you—some pleasant perfume in the air—that you are approaching the sea. Your imagination is becoming excited, your pulse quickens with eagerness, when suddenly, just while you are in a state of feverish expectation, and you are afraid that your companion will address you with some commonplace remark in unsophisticated English, and so break the charm, the train stops at a railway-station, and you are told that you have reached Venice.

Now, a railway station is altogether foreign to our ideas of what the approach to Venice ought to be; and terribly confusing to the mind is it to be forced to pull down all the lofty dreams that have been filling it for the last hour or two, and to find yourself surrounded by a troop of noisy individuals in utterly unpicturesque costumes,

"A good canal enof; 'tis only ven de tide is out she schmells."

crying out, like so many New-York hack-drivers, "Gondola? Barca? Gondola? Barca?" So, although I knew of all these exceedingly unromantic circumstances from the experience of others, yet their actual occurrence came upon me like a blow from Thor's hammer. Even after we were seated in our dark, funereal gondola, and were slowly moving down the Grand Canal, with the gray old palaces on either hand, looking like poor patricians who had once seen better days and were now condemned to stand upon the brink of that which would one day prove their own watery grave, I believe the prevailing feeling with all our party was one of disappointment, though all remained perfectly silent, as if ashamed to acknowledge the truth to each other.

Our first visit, however, to the noble Piazza San Marco more than restored our preconceived ideas, filling us with the greatest admiration and delight, and though, through the medium of pictures and photographs, every one is familiar with the superb buildings that surround it, yet here color, warmth, and animation, are added to complete the picture, which, once seen, can never be forgotten. Standing opposite the ducal palace, with its colonnade of massive pillars, bearing a lighter one above, and its checkered walls of white and red marble, my eyes suddenly rested upon the capital of one of the corner columns, with its curiously-sculptured Judgment of Solomon, and I remembered, with a feeling of tenderness tugging at the parental heart, how, a night or two before I left my household gods, I was showing to my little ones—now, alas! three thousand miles away—a stereoscopic view of this very angle of the ducal palace.

On the east side of the piazza, whose magnificent pavement is of square pieces of gray marble with white tracery, stands the glorious Temple of St. Mark, whose once gilded domes instantly transport the imagination to Constantinople. The immense amount of Oriental marble, bass-reliefs, bronzes, gilding, and mosaics, with which the whole surface of this remarkable building is covered, is truly marvelous. In front of the cathedral stand the three gigantic bright-red flag-staffs that once supported the standards of the three vassal kingdoms of the republic—Cyprus, Candia, and the Morea. On a line with these, the Campanile lifts its square brick tower three hundred and thirty feet into the air. At its base stands Sansovino's beautiful little lodge, elegantly adorned with statues, bass-reliefs, bronzes, and marbles.

At the end of the *piazzetta* which terminates on the quay are planted the two columns of Oriental granite, said to have been brought from the Holy Land, one surmounted by the winged Lion of St. Mark, and the other by the statue of St. Theodore. Any reward having been offered to him who should succeed in raising them to their present position, Nicolo il Barattiere, as he was called, who at length overcame the difficulty, demanded the *legalization of gambling between the columns*. The grant being unavoidable, the spot was at the same time dedicated to public executions, for which reason it was considered a bad omen even to cross this space. It is said that the unfortunate Marino Faliero landed here when about to assume the dogedom.

We ascended the Campanile, not by a staircase, but by an inclined plane, which a royal personage is said to have once ascended on horseback. From a gallery near the summit we looked down upon magnificent but melancholy Venice, which, though broken into many islands, from that height seemed but one, with the Grand Canal winding through it, spanned by the Rialto, and communicating with the minor water streets of the city. On the west lie the porphyry hills of Euganea; on the east rolls the Adriatic; and in the distance a splendid panorama of the snowy Alpine peaks glitters like fire in the setting sun.

The Piazza San Marco is the very centre of Venetian life; its superb marble colonnades, under which at one time the nobles alone had the privilege of walking, are both day and night thronged with animated crowds of people. At night it is especially attractive; the brilliantly-lighted shops and *cafés*, starred and garlanded with lamps, are filled with well-dressed loungers of both sexes, who here assemble to enjoy the pleasures of social intercourse, to eat ices, to drink excellent coffee, and to listen to good music. It is one of the hardest things in the world to tear yourself away from the fascinations of this brilliant and animated scene. With the cheerful sounds of merry laughter, tinkling glasses, rustling silks, and soft Italian voices lingering in the ear, and color, light, and loveliness still charming the eye, it is indescribably depressing to find yourself once again seated in your black gondola, moving along a dark and dreary canal.

It is a melancholy truth that, on opening my window the first morning after our arrival, the odor that arose from the canal beneath was of so fearful a character as to cause me to petition the "gentlemanly proprietor" of the Hôtel C—, a stout Teuton of much courtesy of manner and very little English, for a change of apartment. This favor he politely and immediately granted, adding, as if by way of apology for the offending canal, while his broad, good-natured face expanded into one of the very blindest of smiles, "Ja, ja, mein Herr, it is a goot canal enof; 'tis only ven de tide is out she schmells."

You may be sure we did not fail to cross the far-famed Bridge of Sighs, and, torch in hand, descend into the gloomy stone cells whose blackened walls have so often echoed the despairing groans of the unhappy victims of a cruel state policy. The only light allowed the prisoner within must have been received, through a small loophole in the thick walls, from a lamp hung in the outer passage. Names and inscriptions, cut in the rough stone with the points of nails by the wretched captives, are still shown to the curious visitor, who cannot help feeling a thrill of pity as he throws the light of the torch he carries on these painful records of human suffering. It was by no means easy to forget all this, even when once more out in the cheerful sunlight, and again filling our oppressed lungs with the soft, delicious air of the South.

DECORATION DAY.

I.

O DAY of sweet blossoms
And memories sweet,
That now on the altar
Of liberty meet,
And mingle their incense
Alike to perfume
The corporal's grave
And the general's tomb!

II.

Wherever are sleeping
Our patriot brave,
A wreath is descending
For every grave,
As if the archangels
In many a crown
Had woven a rainbow
And showered it down.

III.

Flowers of the magnolia,
The South bringeth forth,
And twines them to-day
With the rose of the North;
For over the fallen
We plighted our troth,
And the dead of the UNION
Belong to us both.

IV.

If we have forgotten
Some mound on the hills—
Some miniature grave
That a drummer-boy fills—
God above it will hang
When the evening lowers,
A star-spangled banner
Sublimar than ours.

CLARENCE F. BUEHLER.

OLD-FASHIONED GARDENS.

THERE is a wide difference between the new and the old fashioned garden in many respects; and few who have lived by an open, breezy lawn, with groups of trees, the outline lost in shrubbery, gay with bright flower-beds, with glades that wander off into cool woods, and vistas that open on the distant landscape, would be willing to sacrifice the freedom and beauty of the general effect for the close quarters of the old garden, with its fences, and hedges, and mixed crops.

Whoever now plans a country home, demands the lawn as its chief feature, and, impatient of straight lines and right angles, would have his paths seem to wander as carelessly as the track of the humming-bird when he goes from flower to flower, demanding its buried sweets. But with all its indifference to openness and breadth, its mixture of the useful and the beautiful, its determined right angles, which seemed to force its less agreeable features into sight, there was a pleasure in the old-fashioned gardens that we, who lived in them in our childhood, can never forget.

The paths were the keys to the place; the land was divided by them into squares or parallelograms, edged with box or till, bordered with shrubs and perennials, and shaded by fruit-trees; the enclosed space was devoted to fruit or vegetables, or occasionally to a grass-plot, with a statue or a vase or rustic basket, or perhaps a fountain, in its centre.

But however incongruous the mixture, the straight paths, with their wide borders, were just the places to show the masses of bulbs, perennials, and annuals, when in bloom, for which the flower-bed in the lawn can make very little room. The long lines and masses of blue, white, and pink hyacinths, mixed with violets, forget-me-nots, blood-root, trillium, bell-wort, pink and white phlox, of the spring, gave place, as the summer approached, to lines of yellow, scarlet, and purple tulips, which marked the paths with unmistakable distinctness.

Before the tulips were fairly gone, they were forgotten in the opening blossoms of the blue and white Canterbury-bells, the fox-glove, ragged robin, scarlet poppies, red and pink peonies, scarlet lychnis, white and red phlox, fraxinella, and groups of white lilies that filled the garden with their delicious fragrance, and glistened like snow among the green leaves.

Tall bushes of June roses, the Scotch yellow Harrison, white cottage, Lady Washington, cabbage, moss, damask, thornless, maiden's blush, and a host more, grew higher than the head, and were so full of buds and blossoms that no one could question the right of the rose to be called the queen of flowers. In the dewy morning the full-blown roses were gathered in baskets, to be packed away with salt until the good housewife could distil out of them their rose-water. But with the roses and the lilies the glory of the flower-garden culminated; there were bunches of tall larkspur and aconite, and summer and autumnal phlox and hollyhocks to maintain some show of color; beds of mignonette, thyme, lavender, and sage, gave their sweetness to the wind; asters, balsams, coreopsis, four-o'clocks, zinnias, tried to replace the perennials, but August and September could make no floral show which would compare with June. The scarlet geranium, heliotrope, and verbena, which had been carefully nourished during the winter, brightened a few spots; petunias crept among the bushes, and hung their white and purple bells over the edges of the walks; but the summer glory of the garden was the blushing cheeks of peaches, purple plums, golden pears, red-streaked apples, and the humbler crops of melons, tomatoes, corn, and cabbages. The grape borders and arbors were no longer fragrant with spicy blossoms, but grew slowly purple with Isabellas and ruddy with Catawbas. In favored spots, on some sheltered wall or rock, the sweet-water, contending with creeper or honeysuckle, would give a few ripe bunches of grapes. The trumpet creeper and clematis wreathed their white and orange colored blossoms above their dark-green leaves; and when the creeper threw its flame-colored flowers into the air, or covered the top of a wall or fence with a crest of leaves and flowers, the clematis filled the spaces below with a white, feathery softness.

The monthly honeysuckles still gave a few blossoms, but the scarlet and yellow trumpet and the evergreens were silent, and could show only red and waxy, sticky, tasteless berries for the bright, fragrant blossoms of spring.

As we walked down the paths in September, and heard the shrill shout of the cicada, the quick chirrup of the cricket, the drowsy hum of the bees in search of fruit-honey, the air just scented with lavender or sage or musk, we thought more of peach or pear or ruddy apples

than of the delicate form, color, and fragrance of the flowers, whose dried and mildewed leaves reminded us rather of death than glory, and gave no hint of the beauty that only a few weeks before filled all the space.

The long alleys of the old garden were choice places for many plants that are shy of the sun; there were beds of vivica, nummularia, and stone-crop, whose thick leaves made good borders for shaded walks and to separate the paths of inside beds.

In some gardens, as in some houses, all things were kept clean and neat; no litter or rubbish was allowed to remain; the box was trimmed close, the overhanging branches pruned out of the way; but in others there was carelessness, and the box grew high enough for birds to nest in, and the tiny feet of the babies of the family often raised them on tiptoe to peep in among the crisp, fragrant leaves at the speckled brown eggs or callow young.

Elder brothers and sisters gathered round to restrain the little fingers that would have lifted out the tender birds by wing or leg, unconscious of the mischief which too much curiosity might cause.

Behind the box, there were often tufts of clove and carnation pinks, whose dark colors and rich fragrance were a joy to mothers and fathers, young men and maidens; but whose short, thick leaves were choice hiding-places for Easter eggs, and the children grew up, loving the pinks because of their association with hidden treasures.

At some point where two walks met, or where the path ended at a neighbor's boundary, there was an arbor of lattice-work, painted green and white, with square windows, seats round the inside, and a table in the centre. The arbor was covered by crimson and pink bausault or Michigan roses, mixed with honeysuckle or woodbine, or buried under the great leaves of the aristotochia, whose queer crooked flowers give it the common name of Dutchman's pipe; and, though haunted by mosquitoes and spiders, often damp and mouldy, was the children's play-house, the lovers' retreat, and the scene of many a tea-drinking and picnic. The prim neatness of New-England households, that seemed to cramp or fetter young souls, was forgotten in the old garden, where no mortal gardener could keep things within bounds or in order. Shrubs and perennials would outgrow shears and spade; trees would stretch their branches into forbidden spots; there was a luxuriant abandon that freed the children from the dread of punishment for disorderliness, and seemed to invite to a free and easy life. Where one of these old gardens still exists, we find the favorites of past generations, some almost forgotten now. Rose-bushes that have stretched into trees, honeysuckles that have long since swelled over stake and trellis, and have been clipped and pruned until their stems have grown trunk-like and have changed them from vines to shrubs; great magnolias, that hold up one or two hundred purple or white cups at a time to catch the warm rays of the spring sun; weeping ash and elm trees that are now dense arbors, their branches trailing widely over the ground; weeping beeches that might be likened to water-falls of green and purple leaves. Frunty climbs from bush to tree, its little pink blossoms and glaucous, fine-cut green leaves giving a lace-like decoration to every plant they cling to. And there are masses of single hollyhocks, pink, red, white, and yellow; and, when the summer is gone and the cool autumn winds remind us of winter, we find in a corner a bed of the autumnal crocus, as beautiful in form and color as their sisters—the harbingers of spring; cultivated not for their beauty, but that the thrifty housewife may save their pistils for saffron, to be gathered, dried, and hung up with the bundles of dried thyme, lavender, sage, and sweet-majoram.

The old garden was a variety-shop, and was quite equal in its stock of plants to that *omnium gatherum*, the village store; but there was an odd formal irregularity and bountifulness in the heterogeneous collection that made it a most attractive place, and keeps its memory green in the heart of many a man who delves in noisy workshops, hot factories, and cheerless counting-rooms.

These old gardens knew nothing of the beauty of the white centauria, the crimson coleus, never heard of canna, colodium, or a chrysanthus, had no masses of verbena and geranium, no beds of purple fragrant heliotrope, were never decorated so as to produce particular effects of color, often grew weedy as the summer passed, and before autumn lost their special charms of flower and fragrance; but there was a rich memory of May and June which stimulated the imagination all winter, and made every member of the household eager to see the snow disappear and to search for the first snow-drop, crocus, and violet.

ROBERT MORRIS COPLAND.

TABLE-TALK.

THE Bishop of Peterborough having recommended that manners should be taught as part of the curriculum of the national schools, the question has arisen in England whether it is possible to teach good manners by such a means. The best way to answer the question is to give the matter a fair trial. We should be glad to see some of our American boards of education take up the subject, for certainly the general public give evidence of a great need of reform in this direction. The London *Spectator*, in discussing the question, concedes that manners can be taught as a discipline, but instances the superficial character of a breeding thus instituted. "No instruction in manners," it says, "can be so perfect as that of the domestic servant, and no lesson can be more perfectly learned. The well-trained servant or waiter, in his employer's presence, is a model of manners, civil, obliging, yet independent; he lacks nothing but the tone which can be communicated only by culture, by the long-continued habit of command, or by exceptional moral qualities. But then he dons his manners with his uniform, and, once off duty, displays all the roughness or brutality of which observers complain. He puts off with his service-coat even the modulated voice, which is the first requisite of good manners, and which is preserved by the cultured classes so carefully that they, in the end, forget that it is entirely artificial. There is sometimes no brute in the world like a soldier off duty, who, for twenty years, has been drilled in all the essentials of manners; no one so hopelessly vulgar as the shopman, who, in his shop, appears to be so full of self-respecting civility. The lad, who at school was drilled into decorum, would not have half the real training in manners obtained by the soldier, the servant, or the little shop-keeper, and we do not see why he should be expected to retain his false mental skin any longer than they do." While there is a large share of truth in all this, it would probably be found that, if our girls and boys were taught manners thoroughly and systematically in the public schools, the instruction coming at the impressive period of life, a large measure of good would be the result. Schools, as it is, leave their impression on the manners of children; and everybody concedes that, whatever may be the deficiencies as regards sound education in fashionable boarding-schools, good-breeding is at least one benefit conferred by them—a breeding, in the estimation of many, too artificial; but the friction of life soon rubs off whatever about it that may be too rigid or purely superfluous. If the high tone of good manners can only be acquired in the refined atmosphere of polite circles, good habits can at least be inculcated at school, and the essential coarseness and rudeness, that are the consequence of vulgar homes, may in some measure be qualified by the discipline of the school-room. We would emphatically urge upon our school-commissioners the consideration of this subject. Manners are minor morals that act more or less upon the greater morals, and good-breeding influences the conduct of men

more effectually than can always be computed. Manners do not make the vicious virtuous; they do not reach down to the depravity of essentially bad men, but over the average human creature they exercise a great control. The world, at least, would be no worse for a general good-breeding, and certainly would be far more agreeable. These are truisms, perhaps, but the current disposition to underrate the value of manners justifies their repetition; and we would fain awaken a public interest in the suggestion that manners should form a regular feature in the training of our public schools.

— We hear it sometimes said that men deprecate learning and genius in the opposite sex because they are afraid of brilliant women. But the men thus charged with mental pusillanimity in regard to intellectual women, are not commonly supposed to exhibit a similar dread of learned and accomplished persons of their own sex. No man withholds from a club because great men belong to it. No man is afraid of a career at the bar, in literature, or in politics, because distinguished persons are connected with those professions, whom it will probably be his destiny to meet and perhaps professionally to encounter. Men, if any thing, are over-confident in all intellectual struggles with their fellows; self-respect, or pride, or conceit—some motive either worthy or unworthy—prevents them from acknowledging inferiority, even if they are conscious of it. It cannot, therefore, be that men dislike learned women because they are apprehensive of intellectual fence. People are usually too unconscious of defeat in all encounters of wit to dread it much. Their very insensibility to the palpable hits and the verbal triumphs of an opponent give them no fear of the conversational arena. The dulness or the indifference of men in this particular is alone sufficient to prevent them from disliking ability in women; and then every man is so profoundly assured of the intellectual inferiority of the other sex that, in the abundance of his confidence, he has no doubt. Clever men know that the most brilliant women are always vulnerable in argument, and stupid men talk on without ever knowing they are defeated. Why, then, is conspicuous ability disliked in women? It may be asserted by some people that we are assuming our ground, and that it is not certain that men are offended at the evidence of talent in the other sex. We think it must be conceded they are—not but what every man imagines women of genius in whom he could find delight; but, whatever learned women may say or think about the matter, the first, the second, and the third essential quality that every man admires in his mother or seeks for in a wife is womanliness. If genius and learning can enhance this supreme grace, genius and learning will be admired in women; but, so long as it is believed that intellectual force extinguishes or diminishes delicacy, gentleness, and sweetness, men will dread its manifestation in their wives and daughters. Frivolity and insipidity, which men are accused of liking in women, are simply accepted with forbearance when they are accompanied by those charms of sex that make women delightful, and which compensate for

so many shortcomings. Judgment, taste, discretion, vivacity—all good qualities of sound minds, are excellent things; but even these in women must be fused into a harmonious, mellow, unobtrusive unity. Delicacy of apprehension, quickness of perception, capacity of appreciation—these supreme womanly qualities of mind every man of taste delights in; but loud argument, boisterous assertion, clamorous talk, these things men do most decidedly dread in women, and these things have too commonly marked our intellectual Amazons. Do not let our ladies lay the flattering unction to their souls that men fear their mental superiority; let them rather believe that there is gallantry enough among us yet even to delight in their victories over ourselves; but let them understand that, so long as man inherits the nature of Adam, the primal delight of his heart will be in fresh, fair, and gentle women, and every honest man will confess that he does fear in woman whatever may tend to rob her of these graces.

— One of the most curious features of the present French revolution is the prominence assumed by General Cluseret. This personage is well known in New York, where he has resided many years, and where he has repeatedly attempted to take a part in public affairs with very little success. He is a soldierly-looking man, rather above the middle height, with a swarthy complexion, and an air of firmness and determination. In 1864 he was concerned in the absurd attempt to make John C. Fremont a candidate for President in opposition to Mr. Lincoln and General McClellan. He edited for some time the *New Nation*, the organ of the Fremont faction, in which he wrote foolish and fantastic articles, exceedingly foreign in their tone and style, and as little likely to make a favorable impression on the American mind as if they had been printed in Chinese. He afterward went to Europe, and took part, we believe, in the Fenian attempt on Ireland. He turned up here again in the beginning of 1870 with a wild scheme of appealing to the Government for the redress of injuries which he had sustained from the Emperor Napoleon, who had ordered him out of France, on the ground that he was conspiring against the empire. The charge was doubtless true, for Cluseret is a born conspirator, and his visit to France was unquestionably not altogether with friendly purposes toward the empire. As he claimed, however, to be an American citizen, he insisted that his expulsion from France was an outrage on our national honor which demanded prompt retaliation or atonement. We believe that no attention was paid to his claims at Washington, where he was regarded as a somewhat crack-brained person with very little principle. The outbreak of the war between France and Germany led him again to Europe, and, after various rebuffs and failures, he has succeeded in becoming for a time the war minister of the Paris Commune. In appearance, in adventures, and to some extent in character, Cluseret resembles the Captain Bruges of "Lothair," though he has not the good sense nor probably the military skill ascribed to that adventurer. The fact that he has been able to make himself so prominent in the conduct of affairs at Paris is one of the

strongest indications that we have seen of the folly and desperation of the Communal insurrection. No party, no community possessing good sense and a reasonable amount of insight into character, would ever confide high office to such a charlatan.

— Theatre-goers in New York have for some weeks been enjoying the performances of Mr. Charles Matthews, the distinguished London comedian. Audiences composed of a more than usual proportion of refined and intellectual people have assembled to witness his renditions, which have so long been famous in London, and which recently won the favor of fastidious Parisian critics. Mr. Matthews appears in plays of a very slight calibre, and his performances have no significance or value beyond the temporary pleasure they confer upon the spectator. It is almost surprising to find so great a reputation identified with renditions so purely ephemeral; but, like the *genre* painters of France, the significance or meaning of his art is subordinated entirely to the grace and finish of the execution. The thoroughness of Mr. Matthews's art in part defeats itself, for people find it difficult to understand the merits of delineations in which nothing obtrusive or marked is permitted to disturb the perfect naturalness of the actor's style. The ease, grace, simplicity, and truthfulness of all that he does will be conceded by every critic, but the entire absence of effort blinds the ordinary observer to the masterly skill of the performer. That art which conceals art was never better exemplified than in the acting of Mr. Matthews. One must admit, however, that the exclusively light and eccentric characters that come within the *répertoire* of Mr. Matthews do not afford a very high order of entertainment. The play that gives subjects solely for the passing laugh most inadequately fulfils its mission. The imagination needs to be aroused and the sympathies awakened at the theatre; plays or actors that do less than this may possess every quality of perfect representation, but scarcely justify a very high recognition.

Art Notes.

IN the spring exhibition of the Royal Academy, London, are some pictures by Millais. Of the two principal ones the *Athenæum* speaks as follows: "Would that Mr. Millais had always done his powers the justice he has in his noble and pathetic landscape, 'Chill October!' It represents a little river bay, with its maze of whispering rushes rustling; one almost hears their secrets as they stand in a body by the bank, as in a gray day they shiver under a chill breeze. The breeze moves the surface of the river, and sweeps through the branches of the willows which fill part of the mid-distance, until the eye glances past them to the further banks of the stream. Over all is the gray sky, with here and there glimpses of its silver lining and an ashy firmament. The picture is a poem in painting, and the more admirable because its materials are homely, or at least found at home, and such as all those who can see may often see. The subject was found on a back-water of the Tay; the art of the painter has supplied that subtle grading of light and tone which all enjoy, while few understand it; that natural and perfect harmony

of low notes of color, grays and greens and whites, are reproduced as only a master can; the bringing of color, light, and tone to complete accord, in which lie the triumphs of *chiaroscuro*, the ineffable charm of the least definable phase of art is the painter's doing, and by far the most fortunate attempt of the kind that he has made. Mr. Millais's largest picture represents the upholding of the hands of Moses by Aaron and Hur while Israel fought with Amalek in Rephidim. Moses was on the mountain; the battle took place in the valley, where the Amalekites had surprised the feeble rear-guard of the Jews, and Joshua was sent to the rescue: 'And it came to pass, when Moses held up his hand, that Israel prevailed; and when he let down his hand, Amalek prevailed. But Moses' hands were heavy; and they took a stone, and put it under him, and he sat thereon; and Aaron and Hur stayed up his hands, the one on the one side, the other on the other side; and his hands were steady until the going down of the sun. And Joshua discomfited Amalek and his people with the edge of the sword.' The composition of this picture is singularly original and expressive. The sky behind the figures has the ruddy flames of sunset. Moses is seated; his face displays utter absorption in passionate prayer, and he seems as irremovable as his rock; yet his supporters themselves are exhausted, as with both hands each grasps an arm of Moses, and, pressing it against his breast, bears it up with his hands—back, loins, and lower limbs, all centred to one action. Aaron, in red, with the water-bottle by his side, is erect and stiff and strong, in ripe age. He turns half about, so as to catch a glimpse of the fight in the valley below the rocky mountain-side, on which the three are placed; yet he seems tired, however resolute. Hur has the staff-hand of Moses, and, like Aaron, clasps it against his breast, bringing to the support of it all his remaining strength; that of his arms has departed long ago. Such is the design and composition of this work; among its more striking qualities is that of fine flesh-painting. Mr. Millais has had this picture in hand during several years past; it does him great honor, and redounds to his credit far more than many of his recent works, which have a tendency the other way." Page, the president-elect of our National Academy of Design, has a large picture of the same subject which he painted nearly twenty years ago.

In the London Exhibition is a painting by Gérôme, *A Vendre*, which is described as follows: "The life-size figure of a girl, who is placed 'for sale' outside a shop in a market, probably in Egypt—a naked, dusky damsel, hardly clothed by her long and thick hair, which hangs in black masses about her shoulder, bust, and face; through these masses she glances with a sulky fire, which is finely expressed. Her salesman sits behind in his shop; at her feet is another female for sale—a Nubian, in a white cotton robe, with red flowers in her black hair, and occupied by a monkey, whose profile is oddly like her own, and who nestles against his mistress's shoulder; she clasps a knee with her hands, resting against a Turkey carpet; a silver-sheathed weapon and other articles of trade hang by the shop, where the master reclines at ease, including a gawdy parrot and a beautiful halibut shell. The dark, half-subdued luxury of the chief girl's sorrowful eyes gleaming in the shadows of her tangled hair—the lithe, muscular freshness of her form—her exuberant limbs, and their fine color—constitute the charms of this picture. Its masterly, broad, yet tender painting and largeness of style will, notwithstanding a certain hardness and the by

no means unimpeachable quality of certain parts of the drawing of the figure, delight artists. The color is extremely rich—free from the metallic lustre which is too common a defect in M. Gérôme's works. The painter has represented the fair and dark races by his women: the one idle, and content with physical ease; the other—however violent, troubled by grief and moved by passion, weak in sense of right and wrong—suffers in constraint, and would strive to be free, even if freedom meant labor."

In Hammerton's "Thoughts about Art," a work that has attracted much attention both here and in England, occurs a passage on the difficulties of landscape-drawing, which we quote: "The extreme refinement of form in natural landscape is a point so little understood by the public, and by the painters of portrait and *genre* who exercise authority in the artistic profession, that I hardly like to mention it here at all. The impression among figure-painters that landscape is easy to draw, and the readiness with which, on the authority of figure-painters, the world has accepted the doctrine, make it painfully evident that all these good people have never really looked at natural landscape at all, nor attempted seriously to copy it. Now landscape is not merely difficult to draw, but it is infinitely difficult; that is to say, that the best designer of the figure now alive upon the earth, whoever that may be, if he really set himself in earnest to draw a mountain as it is, would find, after any quantity of labor and care, that he had only been able to draw it in a manner which is to be called good out of indulgence for the weakness of human faculties, and in a certain restricted sense, and that the natural mountain still remained at quite an infinite and unapproachable distance beyond him. As for the slight sketches of mountains which figure-painters are accustomed to put behind their personages by way of background, they bear precisely the same relation to real mountain-painting that the figures we landscape-painters sketch in our compositions to do real figure-painting. If I can judge of the progress of others by my own, I should say that one of the clearest signs of advancement in drawing is a steady increase in refinement of line and consequent moderation, and that the best proof of progress in color is an increasing relish for slight gradations and faint reliefs, and quiet harmonies."

"The French," says the *Saturday Review*, "believe themselves the greatest landscape-painters on the face of the earth; and yet their ideas about Nature are all but unintelligible to the average run of Englishmen. Certain distinctions between the two national schools are evident. Our English painters, it may be said, hold the mirror up to Nature; their transcripts are photographic, uncolored by emotion; hard, tangible facts are wrought out literally, even mechanically. On the other hand, French landscape-painters approach Nature with passion, their eye kindles with the fire of frenzy, and is sometimes shaded with melancholy. It has been said with truth that a Parisian rushes at Nature as a relief to artificial city life, as a healthful reaction from a highly-wrought civilization. And it is easy to understand how men who promenade for months along the cut avenues and prim flower-beds of the Champs Elysées may feel a wild sense of liberty on reaching the Forest of Fontainebleau, or when careering across the wide plains of Algeria. French landscape-artists show the glee of a caged bird escaped, of a prisoner let loose, of a traveller long bound to

shipboard when touching the land, treading the grassy turf or gazing on cool green trees. Sometimes, however, relief comes too late; the spirits cannot regain elasticity, Nature herself seems gloomy, and pictures then painted will share in the mind's melancholy."

In Goupil's Gallery hangs a new picture by Mr. Church. The subject is "Jerusalem." It presents an excellent topographical panorama of the site and surroundings of the Holy City, but has few of the merits which make a really fine work of art. The sky, perhaps the best feature of the scene, has a good deal of merit in the formation of its clouds, and the feeling of space one receives from it. Otherwise the color is thin and poor; and this thinness and coldness of tone applies equally to all parts of the picture. The city, Jerusalem itself, is very minutely drawn, but every object in it, from the wall, cut as hard and sharply as a strip of paper against the pale grass without, and the pink buildings within it, lacks any feeling of distance, and any atmospheric effect. So too with the near foreground; the hill-side, the ravines, and the trees, though delineated with the most faithful exactness of detail, lack solidity of form, or the firmness of line which distinguishes a tree from a stone, or the stone from a rolling field.

"Whatever may be the capabilities and scientific excellences of the Albert Hall," says the London *Athenæum*, "there is not much to call for remark in the architectural character of that vast structure. As a piece of engineering it seems to be all that could be desired, but neither its external nor internal aspects move any one to warm admiration. Probably its most satisfactory parts are the advanced porches, which are striking and picturesque, and the internal arcade, which, to say the least, is elegant in design. The architectural treatment of the organ, except so far as relates to certain hideous dumpy pilasters and the wooden arches which connect them, is very good indeed. The terra-cotta enrichments to the exterior are trite, tame, and rather coarse. As to the decoration of the interior, one may say that, while not without much elegance in the proportions of the details, the effect of the whole must necessarily depend on the nature of that chromatic enrichment of which it so greatly stands in need."

In Schaus's Gallery, Broadway, there hangs an ideal head, painted by Mrs. Ione Perry, called "Ferdinand," which has attracted some attention. It is designed to represent Shakespeare's Ferdinand of "The Tempest," at the moment he is listening to the mysterious and enchanting music that floats in the air from the lips of the invisible Ariel. The head is too ideal for Ferdinand—too ideal and sentimental for life or truth under any name. It almost entirely lacks the elements of man as a creature of flesh and passion, but it is such a face as poets sometimes like to dream of. These ethereal conceptions have a great charm for many minds; but Mrs. Perry must supplement her delicate imaginings with more strength if she would command general attention.

Foreign Items.

PROFESSOR OPPOZZER, the great Austrian physician, who died a few weeks ago in Vienna, was a very eccentric man. He often went out among the poor of Vienna and prescribed for them in a disguised hand. One day he was at the bedside of a poor widow who was dangerously sick. All at once a messenger

from the Hofburg entered the room and requested Oppolzer to repair immediately to the imperial palace, the empress having been taken sick. Oppolzer inquired what was the matter with her. Upon receiving the reply that she had a very bad headache, he quietly said: "Her majesty can wait until to-morrow, but the widow here cannot." On another occasion the Emperor Ferdinand conferred a very high order upon him, but, as there were some charges to be paid on it, Oppolzer sent the order back.

The Prussian authorities state officially that the assertions of the French newspapers about the large number of Frenchmen who were said to have been flogged by order of the German officers are unfounded. That mode of punishment was administered only to twenty-three persons. Nine civilians were shot after trial by military commissions.

The Emperor Alexander of Russia was recently violently attacked by one of the domestics at the Winter Palace, who had suddenly become deranged. The czar did not succeed, without some difficulty, in overpowering the madman, and he bore traces of the struggle in his face for nearly a week.

All the officers of the court-martial which ordered the prominent ladies of Brescia to be publicly flogged in the year 1849 have been killed by the descendants of the victims. The last of these brutal military judges, Count Annstein, was recently killed by a young man named Wacetti, whose mother had received fifty strokes of the *verges* at the barracks of Brescia in the above-mentioned year.

At the request of the Crown-Princess Victoria, the Emperor William has issued orders that henceforth all vacancies in the *personnel* of the public libraries of Prussia shall be filled by the widows of soldiers killed in the war with France.

Ex-Queen Isabella of Spain is employing her spare hours usefully in taking lessons in the German language. Until quite recently the daughter of Ferdinand VII. and Maria Christina spoke only her own language, and that not very correctly.

Napoleon III. cannot be so very poor as some of his adherents would make us believe. His agents have recently invested for him upward of eleven hundred thousand florins in property situated at no great distance from Vienna.

Last year only forty-two German authors dedicated their books to Queen Victoria. Ten of them received in return presents of more or less value. The others had to content themselves with letters of thanks.

Lieutenant Bernhardt, the young officer of hussars who, as a reward for his gallant conduct in front of Paris, was allowed to head the German troops entering the French capital, has died of typhoid fever.

One of the principal grievances of the unruly Roumanians against their hospodar, Prince Charles of Hohenzollern, is that the prince is secretly married to a German woman of plebeian descent and doubtful character.

The publishers of the music to the "Wacht am Rhein" have given one thousand thalers to the war relief fund, the sales of the celebrated war hymn having yielded them a very large profit.

The Emperor William has refused to add one hundred thousand dollars to the fund of

the Schiller *Stiftung* for poor German authors. He is dissatisfied with the way in which the *Stiftung* has recently been managed.

A Neapolitan professor has been detected in the attempt to purloin a number of very valuable curiosities from the Pompeian Museum. He had already sold them in advance to an English tourist.

Octave Feuillet writes, in a recent letter to a friend, that the terrible events in France have made so profound an impression upon his mind, that he is unable to do any serious literary work.

Maria Sophia Schwartz, the Swedish novelist, is the daughter of a German physician, and she writes all her books both in Swedish and in German. She has thus far published no fewer than thirty-one long romances.

The Belgian house, which has hitherto published the novels of Madame Rattazzi, has declined issuing her new book, "Eudoxie," on account of the offensive allusions it contains to the ex-Empress Eugénie.

Nyary, the most brilliant political orator of Hungary, committed suicide a few weeks ago at Pesth by throwing himself out of a fourth-story window. He was unable to meet his pecuniary obligations.

Professor Pilcher's thefts from the Imperial Library at St. Petersburg, it has now been ascertained, amount to over seventy thousand rubles. What he did with all the valuable books is yet a mystery.

They have a funny way of voting at the elections in Roumania. The elections last two days. On the first day only voters voting "aye" are admitted to the polls. On the following day the "noes" are received.

The King of Bavaria intends to establish at Bamberg a school for actors and operatic performers. The building will cost one hundred and fifty thousand florins.

Among the lieutenants of the Communist army killed at the bridge of Neuilly was Berzowsky, the Pole, who tried to assassinate the Russian czar in the year 1867.

Kossuth has been persuaded by his new wife to return to his native country. Hitherto he had steadily refused to do so as long as a Hapsburg occupied the Hungarian throne.

Since his recent sickness, Rochefort's face presents a most repulsive appearance; blisters, covering it entirely, having been applied to it for many hours in order to save his life.

The most eloquent speaker in the German Parliament is Herr von Treitschke, a Heidelberg professor, who is so deaf that he is unable to hear his own words.

Like Napoleon I., General von Moltke at one time seriously intended to leave the service of his own country, and to become an officer in the Turkish army.

Rochefort has lost every sou he earned by publishing *La Lanterne*. Neither the *Marseillaise* nor the *Mot d'Ordre* ever paid expenses.

The Empress Elizabeth of Austria presents one hundred florins to every mother in the Austrian monarchy bearing her eighth child.

Murad Azy is the name of a Turkish novelist whose works are said to be exceedingly interesting.

Jean Jacques Offenbach, the composer, has

purchased a house in St. Petersburg, where he will henceforth reside.

The losses which the French publishing trade sustained in consequence of the war of 1870 are estimated at forty million dollars.

They say in Constantinople that the Sultan of Turkey is so illiterate as to be unable to write his own name.

Louis Blanc has offered to give one-half of his large fortune to the fund for paying the war debt of France.

Perloff, the Russian poet, has been granted a pension of two thousand rubles by Czar Alexander II.

A translation of the Mühlbach novels into the Magyar language is now in course of publication at Pesth.

Prince Napoleon announces that he will publish an additional volume of the "Correspondence of Napoleon I." at his own expense.

The *Hamburg News* is the most profitable daily paper published in Germany.

The attempt to establish an illustrated paper at Copenhagen has failed.

Part of the Thorwaldsen Museum was recently destroyed by fire at Copenhagen.

Victor Hugo lives at present at the Hague.

Miscellany.

Notes of the Siege of Paris.

(Translated from the French for Appleton's Journal.)

INTER ARMA, LITERA.

AT Neuilly, in the environs of Paris, stood a charming little country-seat, the residence of Alexandre Flan, a sprightly composer of happy *vaudevilles*, noted among his intimates for his exuberant wit and high spirits. He had purchased this suburban retreat with the fruits of half a lifetime of labor—alas, in his case it proved much more than half!—had embellished it with a carefully-chosen and all but perfect theatrical library, and hoped that in this spot he might realize the *hoc erat in votis* of his master Horace. One day he was abruptly told:

"You must get out of this place; the Prussians are coming, and, if the engineers do not pull down your house, the Prussians will sack it!"

"Leave this place," he replied; "impossible! No, it cannot be. I will wait; they will not come."

While he yet paced his little garden with uneasy step, where his own hand had grafted every tree; while he yet contemplated with affection all his books collected with so much pains and arranged with so much care—there came a rude knocking at the door. It was some engineer troops.

"Come, there is no use talking; you must move this evening!"

"This evening? Why, it would take eight days to remove my library alone!"

"So much the worse for your library. This house comes down to-morrow!"

The unhappy author was struck speechless. He said nothing more, but, hastily collecting a few necessities, wandered off he knew not where. At the first hotel he came across he asked for a room and went to bed.

When they went to call him in the morning

he was found there—dead! All that made life happy for him had been snatched away, and he fled from what was to him but a world of sorrow.

His sad history was that of many others.

Some were more fortunate, and found their houses uninjured by friend or foe at the close of the siege.

"At last we found our house," writes Théophile Gautier, describing a trembling visit to his little country-seat, "and on the outside nothing was changed. The head of Victory from the Parthenon, the marble for which had been brought from Athens, was still in its place on the wall of my workshop, flanked by the Venus of Milo, whose superb beauty, *vis superba forma*, had made me select her as the tutelary goddess of my humble abode. One window was open, as if the building still sheltered its former inhabitants. We accepted this as a good omen, and obtained entrance with beating hearts into this little place, as small as the home of Socrates—so small it would not have been difficult even to fill it with friends.

"There is a singular sensation on entering a long-deserted house, a feeling that you are disturbing some one who has lived there during your absence. You almost expect to see the flutter of robes behind the doors as these mysterious inmates flee before you. For at your approach the spirits hush their whisperings, the spider stops weaving its web, and silence reigns till the echo of your own footsteps rings through the deserted rooms with a strange, appalling sonority.

"Nothing had been touched. No damage done, no one had been there in my absence, the modest retreat of the poet had been spared.

"On my chamber mantel-piece a volume of Alfred de Musset was open as I left it. On the wall still hung a half-finished picture by my daughter, now far away, and in the maiden's little chamber there exhaled still a faint sweet odor from an unstopped bottle of perfumery which stood on the marble-covered dressing-table.

"From there I ascended to the workshop, in course of arrangement for labors which perhaps I was destined never to see accomplished; every thing was finished except painting, and the Oriental proverb, 'When a house is finished, Death enters,' forced itself vividly on my mind, standing on the spot where so many days, fraught with mingled good and evil—more evil, though, than good—had passed never to return; where so many friends had called, who had since departed on their long journey.

"Then in the garden, where I loitered a while before taking leave, an evening fog was rising and draped the ends of the avenues with gauzy curtains. A light breeze stirred the moist leaves, and the trees shivered as if they felt cold. An old black-and-yellow blackbird came hopping along the path and flapped his wings as though to bid me welcome. I knew the bird well; every spring he had built in the ivy that clung to the wall, and came whistling to my window pertly, to overlook what I was writing.

"Just at this moment Mont Valérien fired two heavy guns, bidding good-night to the Prussian batteries. The explosion resounded through the agitated air, but the bird, well used to such disturbances, was not startled."

EPISTOLARY FENCING.

One day during the siege General Trochu received the following through a messenger from the Prussian outposts:

"VERSAILLES, December 5, 1870.

"It may be of service to your excellency to know that the Army of the Loire was defeated yesterday near Orleans, and that town occupied by the German forces. Should your excellency seek confirmation of this news, and desire to send one of your own officers to verify it, I shall be happy to furnish him with a pass to go and return.

"Accept, general, the expression of the high consideration with which I have the honor to be, your most humble and most obedient servant,

"VON MOLTKE,
"Chief of Staff."

To this General Trochu replied:

"PARIS, December 6, 1870.

"Your excellency deems it may be of service to inform me that the Army of the Loire has been defeated near Orleans, and that town occupied by German troops. I have the honor to acknowledge the receipt of this communication, which I do not intend to verify by the means which your excellency suggests.

"Accept, etc.,
"TROCHU,
"Governor of Paris."

Two days after this there flew into besieged Paris a pair of carrier-pigeons which were recognized as belonging to a number of such birds taken out by the balloon *Daguerre*. Now, it was known in Paris that this balloon had fallen into the hands of the enemy near Ferrières. It was observed, too, that the papers attached to the birds were not fastened in the same way that the French were accustomed to do it. Here is one of these suspicious dispatches:

"To the Governor of Paris:

"Rouen occupied by Prussians, who are marching on Cherbourg. The country-people receive them with acclamations. Orleans is retaken by these devils. Bourges and Tours threatened. Army of the Loire completely routed. No further chance of safety in resistance. (Signed)

"A. LAYERTUJON."

The best of the joke was that M. Laver-tujon, the assumed writer of this dispatch, was then in Paris, acting as secretary to the government.

THE FLYING POST.

Paul de St. Victor thus celebrates the services of the famous carrier-pigeons of Paris:

"They are the doves of this huge ark beaten by waves of fire and blood; and the delicate spiral of their airy track seems like a rainbow predicting the end of storms. Under their little wings the soul of the whole country palpitates. What kisses and tears, what hopes and consolation fall from their plumage, saturated with snow or torn by birds of prey! Returning to their nests, they bear hope, encouragement, life, to thousands of human dwellings. More than ever now, and in the purest sense of the word, do they merit the title, 'Birds of Love.'

"Like the storks of Northern cities, like the pigeons of Venice, they should be henceforth considered sacred. Paris should remove their dove-cots and establish them beneath the roof of a temple. The traditional poetry of this mighty siege, unique in history, will cluster around them. Their future flutterings in street and garden will ever remind us that there was a day when every heart in this great city hung on the wings of a carrier-pigeon! Let, then, a religious veneration cling to these

propitious birds. During her long siege, Venice, a thousand times more famished than Paris, forbade the pigeons of St. Mark to be touched. Corn was very scarce, men wrangled over a scrap of bread, but *their* food was never behindhand a single day. Venice, dying of hunger, threw to her pigeons the last grains from her empty granaries!"

THE SHELLS AND THE CITIZENS.

When the shells exploded on the street, all the street-boys scrambled for fragments, which they sold as keepsakes. A warm piece brought a higher price. Such was the curiosity among men, women, and children, that, as soon as a projectile had lodged in the ground, they all pressed to the spot. Finally, the government issued an order deprecating the practice. In this order, or proclamation, it was explained that one shell dropping at a given point was almost certain to be followed by two or three more, and to go there was like running under a spout when it was raining. Though all seemed to recognize the wisdom of this advice, nobody seemed to mind it.

When the workmen in the streets saw a well-to-do citizen coming along, well dressed, with large stomach decorated with white waistcoat and gold watch-chain, it was their great delight to shout, "Look out for the shell!" Then the good citizen would fall flat on his stomach in the mud (such was the course prescribed to avoid flying fragments), and was only informed of the joke that had been played upon him by a burst of laughter from the gratified crowd.

A wine-merchant at Auteuil, whose establishment had been struck by some projectiles, added to his sign, "Headquarters of Bombshells," and immediately drew a crowd of customers.

These were some of the pleasanter features of the bombardment, but there were, alas! some horribly-tragic scenes connected with it.

The men, being for the most part in the trenches or on the ramparts, were not nearly so much exposed to danger as the women and children in their houses. Women were killed with children at their breasts; children in the cradle; mothers of families at the doors of shops, trying to get provisions for their starving little ones at home. All Paris shuddered with horror at receiving the following invitation, which was widely distributed:

"M. and Mme. Jules Legendre, with great sorrow, inform you of the death of their daughters: Alice, three and a half years old, and Clémence, eight years old, both killed by a Prussian shell."

The seminary of St. Nicholas, one of the largest educational institutions in the capital, was struck, and five boys, from twelve to fourteen years old, were killed or wounded.

A school for young ladies was also entered by a shell, which mutilated several of the inmates and killed two outright.

An immense crowd followed these victims to their graves, and over the coffins of the scholars of St. Nicholas an eloquent, touching oration was delivered by Jules Favre, in which he denounced the needless barbarity that had caused so many innocent deaths.

Some fatality appeared to guide the shells to the hospitals, museums, and libraries, on the left bank of the Seine. But, after the hospital of the Val-de-Grâce had been struck many times, General Trochu placed the wounded Prussians there, and informed the Prussian commander of the fact. After that the building was not injured.

The sick, who were in temporary hospitals in the Luxembourg, were obliged to flee; the Garden of Plants was destroyed, and the mag-

nificent conservatories of the Museum, the finest in the world, utterly ruined. The venerable director of this establishment, the famous Chevreul, wrote as follows in the official record of the institution:

"The garden of medicinal plants, founded in Paris, January 3, 1638, under Louis XIII., changed into the Museum of Natural History in 1794, was bombarded under the reign of William I., King of Prussia, Count Bismarck being chancellor, by the Prussian army on the nights of the 8th and 9th of January, 1871. Up to this period it had been respected by all parties and all foreign powers."

DISCUSSING THE SURRENDER.

It is said that the government convoked a council of the superior officers of the army at the Hôtel de Ville.

After laying before them the condition of the defences and the amount of provisions left, the opinion of each one was asked separately, and the supreme command was promised to him who would take upon himself to defend the place to the last. From generals the offer passed to the colonels, from colonels to simple captains, but all declined this terrible honor.

One alone, it is said, though history so far is silent as to his name, energetically pointed out a plan for breaking through the lines of investment, which he said could not fail of success; but then, after breaking through, the army would have been in a desert, without means of subsistence, and speedily demolished by the enemy.

The Revolution of the Commune.

In the last number of the *Fortnightly Review* there is a very able paper, by Frederic Harrison, on the "Revolution of the Commune," in which there is an attempt to explain the causes of the insurrection and the motives of the Communists. It points out the injustice that has everywhere characterized the criticisms of this movement and the extravagant misstatements that have been circulated by the press. It shows that while Paris has always been the real intellectual centre of France, its head and heart, the political power has been lodged in the provinces. The Bourbons, the Orleanists, and the Empire, have successively ruled Paris and the cities in direct opposition to the ideas of those great centres, by means of the support of the peasantry and the Church. The entire population of Paris is ardently republican; they resent the oppression of priesthood, soldiery, and police. But they seek a changed political state only as a step to a changed social state. "The workmen of Paris," says Mr. Harrison, "had found by bitter experience that not only was their political but their social future impossible while the bonds of centralization between the city and provinces remained. They found that their great industrial movement was crushed by a government resting on the country." But, in the language of one of their own documents, "our enemies deceive themselves when they accuse Paris of seeking the destruction of French unity. The unity which has been imposed on us up to the present by the empire, the monarchy, and the parliamentary government, is nothing but centralism, despotic, unintelligent, arbitrary, and onerous. The political unity as desired by Paris is a voluntary association of all local interests, the free and spontaneous coöperation of all individual energies with the common object of the well-being, liberty, and security for all." The ideas which animate the Communists are social as well as political, and it requires no little study of Parisian life and politics to comprehend the

complex motives that have prompted a revolution the real nature of which has been so little understood. Mr. Harrison concludes his eloquent paper as follows: "Though the mass of the workmen in Paris, like the mass of the people everywhere, who cling with intense love to their personal and domestic belongings, are not and never can be communists; they passionately believe in the spirit of which communism is the gross and extravagant expression. The people of Paris believe not in any god, nor in any man. But they have a religion of their own, for which they are ready to die. That religion is the faith that capital and its holders must adapt themselves to nobler uses, or they had better cease to exist. A society in which generation after generation passes away, consolidating vast and ever-increasing hoards of wealth, opening to the wealthy enchanted realms of idleness, luxury, and waste—laying on the laborer, generation after generation, increasing burdens of toil, destitution, and despair; a society in which capital has created a gospel of its own, and claims for the good of society a divine right of selfishness, the right to exert its powers at will indefinitely for the indulgence of its own desires, rebelling against any social control, and offering up 'with a light heart' the misery and degradation of the poor as a sad but inevitable sacrifice on the altar of competition—such a society these workmen of Paris will not forever tolerate. The war and the siege had rudely broken the splendid flow of the established order of things. For once luxury, pomp, and accumulation, had been arrested in mid-career. For six months they had all stood, rich and poor, side by side on the ramparts. They had seen themselves all brought down to the simple worth of man. They had seen the millionaire unable to buy a loaf with his hoards; they had seen the master of factories as poor and as helpless as Crusoe on his island. They had been called on to serve in arms, and they had served. They had been ill led, ill governed, distrusted, and eventually stung by a crushing and unexpected surrender. And now they were told it was all over. Their idle season was ended. The workshops in time would open; in the mean while they must shift for themselves, and in the first place pay the arrears of rent and debt which had grown while the war had suspended trade and cut off their earnings. It was hard, but they must submit to the law of competition, and supply and demand. They must shift for themselves; the great god Competition would, somehow, bring them out at last. In the interval numbers might starve or rot, but soon trade would revive; Capital, if they were quiet, would timidly return, and condescend to send for them; the gayety and life of the city were even now recovering; Luxury, Wealth, Self-indulgence, and gilded Vice, were hastening back to their old haunts after their tedious absence in foreign capitals; Pleasure would come back to her wild, satyr dance, and Enterprise to her grand mill, by whose myriad wheels colossal fortunes would be reared, and through whose gates the poor might crowd and crush for their pittance. The old familiar world had been suspended, but was not dead. It was about to restore its wonted triumph; and, while the poor scrambled and struggled for bread and life, Competition and Riot should renew the spectacle of selfish and pitiless ostentation. And this the workmen of Paris with arms in their hands, this, they said, should not be forever. Little knowing how to end it, or what it might be that could save them, they have thrown up this tremendous yet wild veto on the absolute reign of Capital. It is their protest against the selfish, anti-social independence of wealth—a

protest which now may fail of effect, which has but a small programme of its own, which may soon be silenced and crushed for a time, but a protest which nothing can stifle forever. The evil, it is true, is deeper than can be reached by any wild protest. Men cannot be forced by law, nor by revolutions, to be just, generous, and right-minded. As a political and violent remedy of profound social disorders, the Revolution of the Commune is abortive, and must fail. These disorders need a true education, a new morality, and an organized religion of social duty. But as a political solution of a profound political disorder, the oppression of the cities by the rural suffrage, the cause of the Commune has triumphed, however cruel the reaction it may suffer. Their great political programme is effectually founded in France; is sufficiently suggested to Europe; and the bloody vengeance of the monarchists will not blot it out from the memory of the future."

Children in Santo Domingo.

A correspondent, describing the curiosities of Santo-Domingo City, writes: "But the most singular of all are the spotted children; that is, white children turning black, or black children turning white. You may believe either, according to your politics. Whether this is a freak of Nature to show that the black and white races can live in harmony together on this island, or whether it is the beginning of a system to introduce white labor here and exterminate the black race, I leave for Democrats and Republicans to discuss in Congress. The spotted children are certainly curious specimens of Santo Domingo productions. There are not many of them, but enough for variety. There are children also here that have learned much of our coinage system, which is astonishing in creatures so young. They stand on street-corners, all over the city, and continually say to Americans who pass them, 'Five cents?' or 'Ten cents?' according to the extent of their English or the knowledge of our coins. They also plead for cigar-stumps, for I believe that unfortunate children of tender age here are 'brought up' on nicotine instead of lactical fluids. They all smoke from the time they walk, without regard to sex, race, color, or previous condition."

Varieties.

A STRING and gun trap for tigers, invented by Captain Rogers, of the British East India service, seems to be a great success. The *Jubbulpore Chronicle* states that a man-eating tiger, long the terror of the district, and "which has been known to attack a party and kill four or five persons at a time," was a short time ago dispatched by having incautiously put his foot in a string attached to a trigger that discharged a bullet which killed him. The trap seems to be an admirable invention, but rather disagreeable to set, for the bait, it is said, was a "dead woman."

A letter from Newfoundland says: "A favorite toast at convivial entertainments in St. John's is 'Death to our best friends.' However frequently the sentiment may be repeated, it is invariably received with shouts of applause and laughter, and honored by the fullest bumpers. A stranger, hearing it for the first time, might be shocked or bewildered by being called upon to drink such a heartless toast; but to the initiated it has a harmless significance. It is equivalent to 'Prosperity to our fisheries'—the 'friends' who are devoted to death being the seals and codfish."

Janesville, Wisconsin, is noted for its smart boys. The latest story is told of a youth of six summers, who was taken to task by his aunt for some supposed offence, which he persistently denied. "Now, Johnny," said she,

"I know you are not telling me the truth; I see it in your eye." Pulling down the lower lid of the organ which had wellnigh betrayed his veracity, Johnny exultingly replied: "You can't tell any thing about it, aunt; that eye always was a little streaked."

A fashion-letter has the following information of interest to those who are improving their grounds:

"Colored lawns are trimmed with white edgings; for instance, a green lawn had a bias flounce headed with a bias band; a ruffle extended each way, and upon this a narrow white edge."

We are unable to say where these "bias flounces" and "bands" are to be obtained, but presume they can be procured at the seed-stores or any establishment where agricultural implements are kept.

A mushroom will lift a paving-stone many times its own weight, rather than turn over and grow sideways, which it would appear so much easier for it to do. So tree-roots will throw over immensely strong walls, against which they have grown, though one would think the pressure against the softer soil would give room for their development.

The Turkish ambassador was at a public dinner in London recently, in company with some of the magnates of the land: the president gave as a toast, in compliment to his excellency, "The Sublime Porte and the Turkish ambassador." The waiter echoed it down the table, "A supply of port for the Turkish ambassador."

Amadeus, the new King of Spain, has found the climate of Madrid so trying to his usually robust health that he thinks he must spend the winter farther south. His physicians have recommended Malaga. The Spanish republicans advise his return to Italy if he has any desire to live long.

The following remedies are said to be valuable and infallible: for corns, easy shoes; for bile, exercise; for rheumatism, new flannel and patience; for gout, toast and water; for the toothache, a dentist; for debt, industry; and for love, matrimony.

Basle is reported to have fifty citizens who possess fortunes estimated to be over ten million dollars each. Basle is the wealthiest town in Switzerland, and men of two million or three million dollars are deemed of little financial consequence.

A gentleman learned in the origin of social customs was asked what was the meaning of the custom of casting an old shoe after a newly-married couple as they started on their trip. Said he, "To indicate that the chances of matrimony are very slippery."

A young girl in Malaga, named Anita Perez, has published, in the *Andalusian Monthly Review*, two novels, which the Spanish critics pronounce superior to any which have appeared in the literature of their country for many years past.

A clever repartee is attributed to the member from Mormonism in the new Congress. A brother member asked him how many wives he had. "Enough to keep me from running after other people's," was the prompt reply.

Dublin city is said to have been built in 800; walled in 838; stormed by Dermot, 1171; fresh charter granted, 1173; castle built in 1220; university founded, 1591; students admitted, January, 1594.

Mayne Reid's novels are exceedingly popular in France. Three years ago the imperial Minister of Public Instruction ordered copies of them to be published for the public libraries of the communes.

Bishop Colenso, who has become as radical as his friend Miss Cobbe, prefaces the reading of the Creed with the declaration that he does not believe it, but reads it as an officer of the queen!

"A young Shakeress" says, in a note, that the assertion often made that the Shaker males hate the females, and *vice versa*, is not true, "for we love each other better than we can express."

Old Moneybags says that a girl with an income of three thousand dollars a year or more is always an object of interest, because she has so much principal.

A clergyman in the West seeks damages of a journal which published a report of his lecture, "Mind and Matter," under the head of "Wind and Water."

There are in the world about one hundred and twenty thousand miles of railway, that have cost ten billion dollars, and give employment to over one million persons.

What is the use of women trying to assert their equality with men, when the court reports of every city establish the fact that a man can beat his wife?

There are said to be millions of pounds of fossil ivory in Alaska. It is of excellent quality, and is worth a dollar a pound in San Francisco.

Madame Gerolt, wife of the Prussian minister, has resided, it is said, for thirty years in Washington, and thinks it one of the most delightful cities in the world.

When does rain become too familiar to a lady? When it begins to patter on the back.

In the Louisiana State-prison prisoners are always washed before they are ironed. Of course.

All the pews in Grace Church, New York—over two hundred—are now leased, for the first time in twenty-five years.

The total expenditure in Europe for education, science, and art, is more than one hundred million dollars per year.

The announcement is made that the single eye-glass has entirely disappeared from good society.

What is that which is so brittle that if you name it you are sure to break it? Silence.

What's the difference between my mother's brother and my mother's sister? One's my uncle and the other ain't (aunt).

Queen Victoria is said to have grown uncomfortably stout during her recent long retirement.

In Colorado there are many men of many mines.

The greatest nutmeg ever known met with a grater.

What causes a cold, cures a cold, and fees the doctor? A draft.

Brigham Young has buried twenty-seven mothers-in-law in five years.

Cotton was first planted in the United States in 1759.

The Museum.

THE Papuans of New Guinea are, as a race, very fine examples of savage humanity, tall, well-shaped, and powerful. They are remarkable for two physical peculiarities—one, a roughness of the skin; the other, the growth of the hair. They are very proud of their hair, and will seldom cut it off; but as, if left untrained, it would fall over the eyes, they have various modes of dressing it, in most cases making it stand out at right angles from the head. The color of their skin is a very dark chocolate, inclined to black, but having nothing in common with the deep, shining black of the negro. Their features are large and tolerably well made. Dress is not used by the men, who, however, wear plenty of ornaments. They mostly have a belt made of plaited leaves or rushes, about five inches wide, and so long that, when tied together behind, the ends hang down for a foot or so. Some of them adorn this belt with a large white shell, placed exactly in the middle. Ear-rings of

plaited rattan, necklaces, and bracelets, are worn by nearly all. Some of them wear a very ingenious armlet, several inches in width, made of plaited rattan, and fitted so tightly to the limb that, when a native wishes to take it off for sale, he is obliged to smear his arm with mud, and have the ornament drawn off by another person. Their principal weapons are bows, arrows, and spears, the latter being sometimes tipped with the long and sharp claw of the tree-kangaroo.

The agility of these Papuans is really astonishing. Along the water's edge there run wide belts of mangroves, which extend for many miles in length, with scarcely a break in them. The ground is a thick, deep, and soft mud, from which the mangrove-roots spring in

such numbers that no one could pass through them, even at low water, without the constant use of an axe, while at high water all passage is utterly impossible. As the natives, who are essentially maritime in their mode of life, have

to cross this belt several times daily in passing from their canoes to their houses, and *vice versa*, they prefer doing so by means of the upper branches, among which they run and leap, by practice from childhood, as easily as monkeys.

There is really nothing very extraordinary in this mode of progress, which can be learned by Europeans in a short time, although they never can hope to attain the graceful ease with which the naked savages pass among the boughs. The familiarity of these people with the trees causes them to look upon a tree as a natural fortress, and explorers relate that as soon as they have succeeded in reaching the villages the natives invariably made off and climbed into the trees that surrounded the villages.

The Papuans of New Guinea.

A New Edition of New York Illustrated.

D. APPLETON & CO.,

Nos. 549 & 551 BROADWAY, NEW YORK.

Have now ready, a New Edition of

NEW YORK ILLUSTRATED,

CONTAINING

ADDITIONAL NEW PICTURES,

Engraved in the best style, of

The Principal Points of Interest in the Great Metropolis.

Pronounced by the Press,

The cheapest and most beautiful volume ever published.

Price, Paper Covers, 50 Cents.

Sent free, by mail, to any address, on receipt of the price.

D. APPLETON & CO., Publishers.

STARR & MARCUS,

22 JOHN STREET, UP STAIRS.

OFFER AN

UNEQUALLED ASSORTMENT

OF THE

Gorham Mf'g Co.

STERLING SILVER-WARE,

Comprising all their newest and most desirable patterns in Dinner, Tea, and Dessert Services, as well as Table Silver of endless variety. The experience of forty years, as Practical Silversmiths, has won for the goods of their manufacture a REPUTATION

UNAPPROACHED BY ANY
OTHER HOUSE.

The Gorham Factory possesses all the newest and most ingenious labor-saving machinery, employing hundreds of hands, skilled in designing, modelling, and finishing, thereby PRODUCING IN LARGE QUANTITIES, ON THE MOST ECONOMICAL BASIS, goods beautiful in design, and of unsurpassed finish, which are guaranteed of sterling purity by United States Mint Assay.

A complete assortment of Gorham Electroplate on Nickel Silver, at prices established by the Company.

APPLETONS' JOURNAL

of LITERATURE SCIENCE AND ART

ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

No. 116.—VOL. V.]

SATURDAY, JUNE 17, 1871.

[PRICE TEN CENTS.]

THE PIGEON-MATCH.—THE SPORT AND THE VICTIMS.

A SKETCH BY HARRISON WEIR.

VENUS VICTRIX.

BY ANNIE THOMAS, AUTHOR OF "FALSE COLORS," "DENIS
DONNE," ETC.

HE was their only son, and it was the ambition of their youth that he should be clever, and beautiful, and prosperous, and happy, with a cleverness, and beauty, and prosperity, and happiness, that are not ordinarily meted out to poor humanity. So, actuated by this ambition, they spun and toiled, labored and saved, and took great heed for the morrow, for the sake of their handsome, spirited boy.

Mr. and Mrs. Arkwright were young people when Bertram was born; but much thought and incessant anxiety to add to their hoard for his sake made them seem comparatively old by the time the young fellow was one-and-twenty. The father in his mercantile office, and the mother in her home, had this thought ever before them: that for Bertie's sake they must be careful; for Bertie's sake they must deny themselves all luxuries, and nearly all comforts that were not essential; for Bertie's sake they must cultivate the "best people," whom they wouldn't have troubled their heads to please, had it not been for this Dagon of a son of theirs.

The devotion of the old people, as Bertie called them lovingly, was very well repaid by the bright-faced, bright-hearted young fellow. At twenty-two or three, the son for whom they had cheerfully sacrificed so much, that other people in their position would never have dreamed of going without, was well worthy of every sacrifice the most self-abnegating parents could make. Unspoiled by the long course of indulgence and ultra-consideration to which he had been subjected, the young man carried in his breast one of the most generous, unselfish, truthful hearts that human being could be blessed with. The only subtlety he knew was the subtlety of gratifying the unspoken wishes of his parents without letting them discover that those same unspoken wishes sometimes ran counter to his own.

The mercantile firm of which his father was the head was an old-established and thoroughly respectable one, and Bertie divined that it would please the dear old father if he, the only son, desired to succeed in it. The boy's own tastes would have led him into other grooves—into the tortuous paths of literature, in fact. But, without much ever having been said on the subject, it was well understood by the son that his sire held the practice of that unremunerative profession in something like aversion. "He'd buy a newspaper property or start a magazine for me, if he only knew that those were the flesh-pots I hankered after," the young fellow said to some of his like-minded friends; "but he'd do it with a pang, sir, and, please God, I'll never cost him one." Verily, they were well rewarded; they were reaping the love they had sown so lavishly.

But it is not in the human heart to rest content with any state of things, however full of beatitude that state of things may be.

"The boy will marry, some day," Mrs. Arkwright said to her husband, when Bertie had reached the dignity of twenty-three years. "If he shouldn't choose wisely for his own happiness, it would kill us both, I believe." And tears filled the loving, motherly eyes at the wraith of the possibility she had conjured up.

"Time enough for us to think about that when Bertie thinks about it for himself," Mr. Arkwright said, cheerfully.

"No, no, my dear; it will be too late then," Mrs. Arkwright said, with some truth and more energy. "When Bertie has seen the girl he loves, and has chosen her, it will be too late for us to think about putting a suitable girl in his path."

"But he may choose a suitable girl for himself," Mr. Arkwright urged.

"And, on the other hand, he may *not*," the lady insisted; "and it is our duty, where there is such a wide choice of good and evil, to put the good in his way. If Bertie made a mistake in his marriage, what would our lives be worth?"

There was something in this; there was a great deal in this. Bertie with an unsuitable wife! The bare supposition made Mr. Arkwright feel more loving to the wife who had been such a suitable wife to him, and the son she had brought him. The king can do no wrong; and Bertie was their king, and could with difficulty do wrong in their eyes. Still, he might do "less well" for *himself* than they could wish him. There was a great deal in it.

Need it be told how the idea, once having entered in, grew, and strengthened, and flourished, and finally bore fruit, in Mrs. Arkwright's

mind? The danger appeared imminent to the mother of such a matchless son. He might fall a sudden prey to any one of the many undesirable girls they knew—to any one of the flighty, frivolous, idle, over-dressed young beings who were about him, and who were unworthy to bear the honors of being Bertie's wife and the mother of Bertie's children. If he should in an evil moment, because his mother had neglected to put something better before him, choose one of these, as she had pathetically remarked to her husband, "What would their lives be worth?"

The something better was heard of at last. Mrs. Arkwright did not actually shout "Eureka!" when she met with Helen Faulkner; but she rejoiced with a great joy, and her heart went out to the girl at once. They met Miss Faulkner at an evening party with her mother, and the mother turned out to be an old friend of Mrs. Arkwright's unmarried days. Remembering that old friend well, and having vividly in mind all her purity and integrity, and womanly truth and sweetness, Mrs. Arkwright felt that there would be happiness and safety and honor in the daughter's being Bertie's wife.

For her own sake, too, Helen Faulkner was well worth the seeking—a clever, well-educated, good girl, capable of managing a house and sustaining a conversation on politics, with the looks and tastes and habits of a cultivated lady, yet no mere butterfly. If Bertie would only love *her*, Mrs. Arkwright felt that they would, indeed, be blessed.

The Faulkners had come up from their country home to have a taste of city pleasures, and, as they were living at a boarding-house only, the Arkwrights' hospitable house being so open to them was no slight boon. The dark-eyed, nice-looking, intelligent girl was a new and pleasant element in the home-circle to Bertie. He drifted into a great, unfettered, frank intimacy with her, and it was only a natural sequence Helen soon came to love him as much as even his mother could desire.

The result may easily be guessed. She accepted his superiority so unquestioningly, because she loved him, that he could but be flattered at her estimate of it. She was the most agreeable companion he ever met with; his mother evidently loved her dearly; and what he felt for her was surely something that sufficiently resembled love for him to be justified in offering it to her as such. He was not a cold, calculating fellow; still he did reason very much in this way before he eventually laid down his arms at Miss Faulkner's feet.

As soon as he had worded the sentiment he had for her, he knew that it was a very warm, true affection, and his heart beat thankfully when he knew that she reciprocated it fully. He could not truthfully say to her—

"Thou wast that all to me, love,
For which my soul did pine;"

but he could assure her, and he did assure her, that she was the first woman to whom he had ever talked love-talk, or about whom he had ever dreamed love-dreams. "The boy," as his father and mother fondly called him still, was at peace in his own mind about his choice, in fact, and, when a man is *that* from honest conviction, his future looms very fairly before him.

"What a lucky fellow I am!" He told himself this a dozen times a day, as more and more the real value of the woman he had won unfolded itself. Lucky, supremely lucky, in having pleased both himself and those dear "old people" who were so tenacious of what was due to him! Lucky, supremely lucky, in having avoided those shoals and quicksands which wreck so many little "first-love" barks! Bertie hardly knew how to be grateful enough for the great good that had befallen him.

And now the time came for the Faulkners to return to their country home, and it was arranged that Bertie Arkwright should go back with them to be introduced to the friends and neighbors among whom Helen had grown up. He knew a good many of these by name and repute already, for Helen was fond of talking of the absent. But there was one whose name had never been mentioned until they were about a stage from Mapledcan, the Faulkners' home. Then, Helen said:

"I had a letter of congratulation from Gertrude to-day, mamma."

"She's been rather long in offering her congratulations, I think," Mrs. Faulkner remarked.

"Oh, she has been away from home, and is only just returned," Helen explained.

"My dear child, what has that to do with it? With all her cor-

respondents in the village, don't you think that the news of your engagement reached her long ago?"

"Who is the object of dispute?" Bertie asked.

"A great friend of mine, who happens not to be a great favorite of mamma's," Helen said, quickly—"Gertrude Wylding, the greatest beauty in our neighborhood. I am longing for you to see her."

"Are you?" he said, carelessly; and then he looked admiringly at Helen's earnest little mobile face, and added, "On my word, then, Helen, Mapledean is an exceptionally well-endowed place to possess such—"

"Ah!" the girl interrupted, blushing a pleased, bright, happy blush, "Gertrude is as different to me as a star is to a candle; she is a *real* beauty."

"And you're the loveliest, sweetest woman a man's eyes ever rested on," he thought, lovingly, as the good young face was turned trustingly and proudly toward him.

"We shall be inundated for a few days, I suppose," Mrs. Faulkner said the next morning. "Nell is rather a popular girl about here, Bertie, and, even if she were not popular, curiosity would bring people to see you. Are you prepared to go through such an ordeal?"

"We sha'n't stay in on purpose to go through it—shall we?" he asked, dolefully. "If it comes in the order of things when we are in the house, all right—I'll bear it like a man; but I don't seem to see the good of Nell and I losing our rides these fine mornings for the sake of gratifying the curiosity of Mapledean."

"Not for the sake of gratifying their curiosity, but I want you and my friends to get known to each other," Helen urged. "I don't want to miss Gertrude."

"She's your village beauty, isn't she?" he asked, indifferently.

"Village beauty," she repeated. "What a joke that phrase will seem to you when you see her! Yes, Master Bertie, she is our village beauty, and you'll have to own, I think, that few in your empire city can compare with her."

"Helen is a little infatuated about that girl," Mrs. Faulkner said, when Helen went out of the room.

"And you are not?" Bertie said, laughing.

"No, honestly, I am not," Mrs. Faulkner said, with energy. "She has done things that I should grieve greatly to think a daughter of mine could do; she has trifled cruelly with more than one man's peace, and yet they all spare her; and Helen, who is herself the soul of honor, vindicates her."

"She's a sort of spoiled village coquette, I suppose," he said, indifferently.

Mrs. Faulkner shook her head. "I hardly know what she is. But I must own that I do wish Helen were not so fond of her; but I have never attempted to coerce Helen about either love or friendship; I only hope after your marriage that the intimacy between the two girls will die away: things must take their course now."

Things took their course. All Mapledean came to take the measure of the man to whom the fair favorite Helen had given herself—all Mapledean with the exception of Gertrude Wylding. She let more than a fortnight pass after Helen's return without coming near the Faulknors' house. But at length, just as Helen was getting piqued at this neglect, and Bertie was becoming curious to see "the topic," as he termed her, she came and won forgiveness at once for her apparent neglect.

She came in rather early one morning while Helen was still employed in setting their drawing-room in fair array for the day. Bertram Arkwright was helping her to rearrange flowers, and was just coming in through the open French window, laden with a mass of blooms and foliage, when the visitor was announced. Instinctively he paused and raised his hat, and the flowers that he had gathered for Helen fell at Gertrude's feet.

"I hope I haven't come too soon," the guest began, greeting Helen.

"Too soon, Gerty, I have been so angry with you for not having come before; why is it? This is Mr. Arkwright; he'll be 'Bertie' to you before long, I hope." And then the introduction that she had been so longing to effect was over, and Helen turned to see the impression her friend had made upon her lover, with triumph in her great, sweet, gray eyes.

So this was the village belle, the local beauty. Well, he was fain to confess to himself that he had expected something widely different.

She had come on horseback, and the riding-habit showed off the supple, luxurious proportions of her figure to perfection. It was a dark-blue habit, contrasting well with the rich red gold of her hair, and harmonizing marvellously with the most intensely violet eyes he had ever beheld. Her face was rather pale and very fair, and her features were perfectly pure and well cut, and at the same time were mobile and full of expression. The riding-hat gave her just what a severe critic might have thought she lacked—height, namely. But it was hard to wish for any thing, even for half an inch, to be added to that splendid beauty that was so dangerous a dower.

What a voice the girl had too! Not the angel Israfil himself, "whose heart-strings are a lute," could thrill the souls of others more subtly than Gertrude Wylding could—there was such entire harmony between the face, and voice, and manner. They were all three equally beautiful and refined, and unlike any thing Bertie had ever seen or imagined.

"And what have you been doing all this time, Gertrude?" Helen asked, after a little reunion talk had been exchanged by the two girls.

"No harm I hope," Gertrude said, smiling. "I went to the springs when you went to the city, you know. I had never been there out of the season before, and it was like going to a strange place—"

"Dull, I suppose?" Helen suggested.

"Some people would have thought it dull, perhaps," Miss Wylding said, with her wonderful smile irradiating her wonderful face. "But I found it far more congenial to my taste than when it's crowded. I had time for things that I never have had time for before. I did a great deal of sketching, and a great deal of reading, took up German, and read 'Faust' in the original. Even your mamma would say that I made the most of my time, I think."

"Did you ride at all?" Helen said, evading the reference to her mother's tolerably well-known dislike to her friend.

"Oh, yes, Venus Victrix was not idle either, I assure you."

"Venus Victrix?" Bertie questioned, confusedly, thinking she must be meaning herself.

"Yes, my mare," she said, with animation. "Such a beauty; you can't think how people look at her when I'm riding her about. Will you like to see her? She is in the yard now."

"Yes, do go and look at her, Bertie, while I finish the flowers, and then I'll come and join you," Helen said, eagerly.

"Did you give your mare her name?" Bertie asked, as he walked out by the side of the greatest enchantress he had ever met with.

"No," she said, and he thought that a faint color crept up into her face as she spoke. "Venus Victrix owes her name to her late owner."

They were by the side of the mare by this time, and Bertie fell to patting, and petting, and admiring her in a very genuine way. She was, in truth, as perfect of her kind as her mistress was, and what more can be said in the way of commendation? A sparkling, splendid, glossy-skinned chestnut, with a tiny mite of a head, a slender, arching neck, and slim legs, firm and fine as a lady's arm. She looked superb as she struck the ground impatiently with her hoof, and gave other signs of animation and suppressed power on the approach of her mistress.

"She deserves her name whoever gave it to her," he said. "What a poem it must be to see you on her!" he added, warmly, and Gertrude laughed her rich, musical laugh, and said:

"Some people were kind enough to think so."

"Where did Miss Wylding get that mare of her's?" Bertram asked that night when he was alone in the moonlight with Helen and her mother.

"It's a long story, and I'll tell it to you when you know Gertrude better," Helen said; "the bald facts would give you a false impression of her."

"The bald facts would just give you a true impression of her," Mrs. Faulkner said, quickly; "that chestnut mare belonged to the man Gertrude Wylding behaved very badly to—"

"I hate that phrase to be applied to a girl," Bertram Arkwright said, with a good deal of that young, trusting enthusiasm in his manner which is sure to diminish as years roll on. "I hate that phrase to be applied to a girl; most likely the fellow deserved a rebuff if he got one from her."

"She might have given it to him before she had been engaged to

him three months, at any rate," Mrs. Faulkner said, resolutely, though Helen made many signs that "no more should be said about it."

"Engaged! was she?" Bertie asked.

"Yes, engaged, and to a man who was a thousand times too good for such a frivolous flirt; he almost worshipped her, I believe; and, when she found out that she didn't love him sufficiently to become his wife, it sent him wrong altogether."

"But, mother dear," Helen interposed, gently, "surely you, who are so just, must admit that it was better, when poor Gerty found out that, that she should have been what she was—frank about it."

"I have no patience with such frankness; frivolity and fickleness I call it."

"Why does she keep the horse?" Bertie asked.

"She is like the old border-barons. She takes while she has the power, and keeps what she can; if I had a son, I should say to him: 'Beware of Gertrude Wylding.'"

A day or two after this conversation, Miss Wylding came down again to the Faulkners' house, and again was poor Bertie almost bewildered by her beauty, and by the brilliant way she rode her brilliant-looking mare. She came down avowedly to have a little girlish private talk with Helen; but, when Bertie, hearing this, offered to go out into the garden and leave them to themselves, Miss Wylding entreated him to remain, with a pretty little assumption of being driven on to do so by irresistible inclination that made him feel guiltily flattered.

And so on, and so on. Who, that has chanced to number a coquette among his or her acquaintances, cannot guess at the fine gradations of manner which this girl, armed with such rare beauty, brought to bear on Bertram Arkwright? His weakness was patent to others almost as soon as it was to himself. Helen saw it with an agony of wounded love and of bitter disappointment, both in her lover and her friend, that it is difficult to depict.

Bravely the girl resolved to hear the worst, and bear the brunt of it at once, whatever it might be. She would not interchange speech with any one on the subject, before she had speech with him about it. "No, mamma," she said, imploringly, when she saw her mother about to begin, one night, as they were watching Bertie home from a miserable solitary stroll. "No, mamma; *don't* speak—at least, not yet." And then Mrs. Faulkner's heart ached with the sharp, motherly sorrow of a full knowledge of her pitiful inability to save her child from this misery that was coming upon her.

By the time Bertie had got himself into the house that night, Helen had strung herself up to say the conclusive words. She did not trust herself to speak a long preface—she rushed straight to the point at once.

"Bertie," she said, "you would think meanly both of my heart and head, if I didn't feel this change in you and tell you of it."

"What change in me?" he stammered.

"This—that Gertrude Wylding has caused," and then my poor little heroine went on with trembling lips to tell him that this was the last time—the last time she should ever speak to him of love. "But we must speak of it this once, Bertie; I think it such a holy thing, that we must bury it decently," she said, with a sad smile; "don't wrong me by thinking that I could hold you to your vows now your heart has gone from me. I won't say that I'll try to forget you, I can never do that; but, oh! Bertie, I hope I shall not see you any more after this."

"Since you wish it!" he said, making no further protest, though he was sorely conscience-stricken. And so the next morning he went back to his city-home, and Mapledan was soon in possession of the fact that Miss Faulkner's engagement was broken off.

The old people at home were very miserable about this falling short of their boy's fealty; but they were more miserable still when he presented Gertrude Wylding to them as the daughter-in-law he wished them to receive. However, miserable as they were, since their Dagon willed it so, they invited her to stay with them. And Miss Wylding and Venus Victrix were soon great objects of public attention and admiration.

It was all very well for a few weeks. The girl won the hearts of both his father and mother, won them so entirely that it was only out of her presence that they remembered to give a sigh for their lost Helen. There was a talk of a speedy marriage, and Gertrude portrayed intense devotion to him, so Bertie was absolutely without fear when the fiat went forth that it was time for Miss Wylding to go home.

The preparations for the marriage were commenced in good earnest by the Arkwrights. A house was taken, furniture was looked at and ordered, subject to Miss Wylding's approval. The whole of the vast business was surrendered by Mr. Arkwright to his son, the old people themselves retiring on a comparatively small income, when—a check came!

It came in the shape of a letter from Gertrude, a letter that followed immediately on the receipt of a most affectionate one from her. She had been questioning her own heart severely, she wrote, and now she found that it was pity and not love that had induced her to accept him. She had pitied him so much for his engagement with Helen Faulkner being broken off, that she had striven hard to compensate him for that loss. But she could not do so any longer at the expense of her own feelings. She wound up with an assurance of her lasting friendship for him, and hinted, that if they ever met again, she would feel obliged by this episode in their lives being as though it had not been.

And so the dream was wholly o'er, and Bertie Arkwright woke up knowing himself to have been a cruelly-deceived man. He was shattered by the blow at first, fell down prone and utterly helpless under it. Then that phase passed, and one of recklessness, that made his poor parents' hearts bleed, set in. But, after a while, the original good that was in this much-loved boy set in, and he checked himself in the course that was killing his mother—checked himself, and stayed at home with them a great deal, and became in all respects a sad and altered man.

"It is a wound that will not heal itself," Mrs. Arkwright said to her husband; "we must help him, dear; we gave him his being, and must make that being as happy as possible; his wound will not heal by itself, because he aggravates it by the thought that he has given Helen such another wound."

But the help the mother longed to give, she did not dare to give yet. At least it must *seem* that accident favored her plan, she felt, however much in reality design had to do with it. And so Mrs. Arkwright mustered what patience she could, and bided her time until the summer brought the Faulkners back to the city.

"Helen Faulkner is coming here, to-day, dear Bertie," she said to her son one morning, and he went on carefully brushing his hat, the red blood meanwhile mounting to his brow, but saying never a word.

"Be home in good time," Mrs. Arkwright went on; and then he said, "I will, mother," and kissed her and went out.

He could not get himself to his office that day. He mounted his horse and rode into the country, and then, in the solitude, sternly reviewed the events of the last year. He had been weak and wicked, and he had been punished. He would do Helen the justice of telling her that he felt these things to be the truth now.

It was evening when he reached home, and Mrs. Faulkner and Helen were both sitting in the twilight with his mother. "Well, Bertie," they both said to him, and he was grateful that the low light did not suffer them to see his face.

But he would be brave at any cost, so he said it was "time for the lamp," and rang and ordered the lights in, and by the time they came he was prepared to show a very composed front to Helen.

A few days after this, he went to see the Faulkners, and found Helen alone. After some time—he never quite knew how it came about—he found himself telling Helen that he had bitterly repented him of that mistake of his, and then it all came quickly, "Would she—could she love him again?"

She could and would. She had been his true Helen all along, even when he was in the toils of Venus Victrix. And so, by reason of her having had such patient love for him, it all came right at last.

As for Miss Wylding, those who are interested in her may care to know that, though these events happened ten years ago, she is Miss Wylding still. She has carried on the campaign against honor and mankind in most of the big cities of the Old and the New World, and, as she is still possessed of the most marvellous beauty, she has carried them on very successfully from her point of view. She has been on the brink of marriage with a London banker, a Parisian count, and a New-York merchant, and one and all of these engagements have come to naught.

It is said now that she must try a new country, for no man who has heard of her doughty deeds will ever put himself in the power of Venus Victrix.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE AYLMER."

CHAPTER XXVII.—MRS. GORDON'S SUGGESTION.

WHEN Mrs. Gordon read her cousin's name on the card, she hesitated a moment. Then she surprised Babette by lifting her face with an air of decision.

"I will see Mrs. Annesley," she said. "Ask her in here."

Babette left the room to obey the direction, and a minute or two of silence followed. To Mrs. Gordon the interval seemed much longer than it really was, and she had extended her hand to ring the bell and ask the cause of the delay, when there came the sound of footsteps, and the rustle of silk, crossing the passage. Through the closed door she heard Mrs. Annesley's voice:

"Just left, you say?—not more than half an hour ago? It is strange I did not meet him. Do you know where he was going?"

"No, madame," said Babette, in reply.

Catching both the question and the reply, Mrs. Gordon dropped the bell-rope with a smile. "I might have known what detained her," she thought—and, as she thought it, the door opened.

The two ladies met in the centre of the floor, and greeted each other with a moderate show of warmth. They called each other "my dear Elinor," and "my dear Pauline," but, beyond this, there was not much of effusion on either side. They shook hands, kissed lightly, spoke of the weather, and sat down opposite each other, like two ordinary acquaintances. Mrs. Annesley looked at ease, but in fact she was very far from that enviable state of mind. She remembered her former discomfiture in that house; and something in her cousin's face seemed to warn her that it might possibly be repeated.

Nevertheless, she plunged boldly into conversation, and began deploring the many social duties that had kept her so long from Morton House. "I am sure you believe that I would have come if I could," said she, looking at her cousin. "Oh, my dear Pauline, how wise you were in declining to reënter society! I so often think of you, and envy you—so retired, so quiet, so surrounded by repose. As for poor me—I might as well be a galley-slave, for all the liberty I have! If it were not for the sake of my children, I really think I should give up society entirely. It tries my health so severely, and is so unsuited to my taste. A quiet day with you, now, would have been much more agreeable to me than all the gay times we have had at Annesdale."

"I should have been glad to see you, if you had come," said Mrs. Gordon; "but pray, Elinor, don't trouble yourself to make excuses for not having done so. I understood your position quite well. It is hard for any one in the full tide of social life to be able to see much of another person who is entirely apart from that life."

"My only consolation," said Mrs. Annesley, "has been that Morton sees so much of you. Riding continually about the country, he is able to come here more often than I possibly could; and I have been so glad of it. I did not feel as if I were completely neglecting you, while he was my representative."

"There was no cause for you to feel so," said Mrs. Gordon, a little coldly.

She was growing weary of these prolonged excuses, and did not see the point of them. Mrs. Annesley saw it, however, and timed her advance to it with careful exactitude.

"In fact, Morton often unconsciously shames me," she said. "He does not let any thing stand in the way of his visits to you. I don't know when I have felt as much ashamed of myself and my own neglect, as I did this morning. I saw him on the piazza with Irene Vernon—have you ever heard him speak of Irene Vernon? Ah, she is such a charming girl, and so lovely!—Well, he had been there for some time, when suddenly I missed him. I went to see what had become of him, and I found Miss Vernon alone. Morton, she said, had received a note from you, and left instantly to obey your summons—he even broke an engagement to ride with her, which he had made for this afternoon. My dear Pauline, when I heard this, I felt absolutely rebuked. Although my house is full of company, I at once ordered my carriage. I was determined not to let the hateful thing which we

call society keep me any longer from coming to see you. I thought I would follow Morton, and meet the dear boy here, and that, after we had both enjoyed a visit to you, we could go home together. But your maid tells me that he has been here, and is already gone."

"Yes, he has gone," said Mrs. Gordon.

She saw the object of Mrs. Annesley's visit clearly enough now—saw it so clearly that all this careful fencing amused her not a little. She could have closed with her, and brought matters to an issue, very speedily, if she had chosen to do so; but she contented herself with this non-committal reply, and left her visitor to show her hand by force of necessity.

"It is strange I did not meet him," said Mrs. Annesley, in the same words she had already used in speaking to Babette. "He could not surely have returned to Annesdale?"

An accent of interrogation made this a direct question, and, as such, Mrs. Gordon answered it.

"He went to Tallahoma, I believe."

"Indeed!"

A pause after this. Within the bounds of civility, how could Mrs. Annesley ask the question which was next trembling on her tongue; and yet, how was it possible for her to forbear asking it? Who of us can account for certain instincts which at various times of our lives influence our actions in greater or less degree? Such an instinct had caused her to follow Morton from Annesdale, and such an instinct—now that she was on the threshold of the matter which had brought him to Mrs. Gordon—made her resolute to press forward, and in the face of civility (or of any thing else) learn what it was. After a short-hesitation, she asked the question:

"Pardon me, my dear Pauline, if I appear curious, but was it on your business that he went to Tallahoma?"

"Certainly not," answered Mrs. Gordon. "I have no business in Tallahoma."

"Then you do not know why he went?"

"Yes, I chance to know why he went."

"And I am not to know, I suppose?" said Mrs. Annesley, flushing.

Her cousin looked at her gravely and silently for a minute, before she replied.

"I might answer that it is Morton's affair—not mine, Elinor," she said. "But since it is in part mine, and since I have a question concerning it to ask you, I shall not violate Morton's confidence in telling you. He has gone to see Miss Tresham."

Involuntarily, Mrs. Annesley started to her feet, and made a step toward the door.

"I knew it!" she cried, passionately, "I knew it! Something warned me that he had gone to see that—" Here she stopped suddenly, and sat down again. "I am a fool," she said, bitterly. "What could I do, if I followed him? He has gone his own way, without any regard to my wishes. How could I prevent him, if I tried, from doing so?"

Her cousin came over to her, and, strangely enough, sat down by her, laying one hand on her arm.

"I will tell you what you can do—if you care to hear," she said.

Mrs. Annesley drew back. The instinct of distrust between these two women was so strong that circumstances could hardly be imagined in which it would not have betrayed itself.

"I do not understand," she said. "I thought you liked this—this girl!"

"You are right," said Mrs. Gordon, quietly. "I did like her. But that was when I knew very little about her. Since I have learned more, she is, so far as herself is concerned, an object of indifference to me. So far as Morton is concerned, however, she is an object of distrust, and as such, to be dealt with—as summarily as possible. Elinor, do you wish Morton to marry her?"

"Can you ask me such a question?"

"Well, I have tested his infatuation thoroughly, this morning; and it has been proof against the strongest plea that I could urge. Yet I forced him to concede that he would give her up, if it could be proved that she was unworthy of him. If you wish to prevent his marrying her, your only hope is to prove this."

"I know it," said Mrs. Annesley, "but I have tried—" She paused suddenly here, caught her breath, and was silent.

"You have tried to prove it," said Mrs. Gordon, quietly. "Well,

* EXTENDED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

I know that. What I don't know, and what I would like to hear is, how you succeeded."

"I did not succeed at all," answered Mrs. Annesley, coldly. "What do you mean when you say that you know of my effort? You cannot possibly know—any thing."

"I fancy I know every thing, or almost every thing," replied the other, with the same composure as before. "Pray tell me, Elinor, did you ever hear of a Mr. Henry St. John?"

The shock of startled surprise caused by the question was unmistakable. But Mrs. Annesley never surrendered without a struggle.

"I do not understand you," she said.

"Don't you?" said Mrs. Gordon, smiling slightly. "Perhaps I can assist your memory by asking another question, then. Do you remember an anonymous letter which, by way of jest, you once wrote to Edgar Annesley?"

"I—think I do."

"I am sure you must, for the events which followed it were too marked to be readily forgotten. Well, you may remember, also, that I read that letter, and admired the ease with which you wrote a hand entirely unlike your own. It is twenty-four years since I saw that writing, but the consequences arising from the letter stamped the recollection of it on my memory; and when a letter—when *two* letters—were shown to me this morning, I recognized the hand at once. Now will you tell me whether you ever heard of Mr. St. John?"

Mrs. Annesley saw that all attempt at further concealment was useless. However much or however little Mrs. Gordon knew, it was at least certain that she knew too much to make denial safe. In an instant she remembered the man who had met Miss Tresham in the grounds of Annesdale, and what had been before merely a suspicion resolved itself at once into a certainty.

"I have heard of him," she said—and then she added, "He is here!"

"Yes," answered Mrs. Gordon, "he is here. I have no right to blame you for the means you took to obtain information concerning Miss Tresham; but it may surprise you to hear that by those means you have brought upon me the curse of my life—the worst enemy I have ever had, or can ever expect to have!"

"Good Heavens!" cried Mrs. Annesley, in amazement. "How could I imagine—whom do you mean?"

The answer came in four bitter words:

"I mean my husband."

"Your husband!"

"I see that Morton has not told you my story."

"Not one word," cried Mrs. Annesley, eagerly, forgetting for the moment every thing else, and with the extreme of curiosity painted on her face, and quivering in her voice. "My dear Pauline," she went on, "you can surely trust me—you can surely confide in me!"

"It is a matter of necessity to tell you something of my life, Elinor," said her cousin, coldly. "Otherwise, I have learned that it is wise to 'confide' in nobody. You know that I was married. What I endured in my married life it is not worth while to tell you. I *did* endure it as long as endurance was possible. When it became impossible, I fled from my tyrant and came here, hoping to find rest and shelter under my father's roof. How long I might have remained undiscovered I do not know. Not long, I suspect. But, however that may be, it was your act which brought discovery upon me. The advertisement, which you inserted in the *London Times* before I came here, has borne bitter fruit. I have been tracked to my place of refuge, and my child has been taken from me—perhaps forever!"

"Taken from you! By whom?"

"By my own will. I have sent him away, that his father may not be able to find or claim him."

"But I do not understand," said Mrs. Annesley, in a state of perplexity which, all things considered, was very natural. "Is it this Mr. St. John who is your husband?"

"St. John! Are you mad? Have you ever seen him?"

"Never."

"He is a hanger-on of my husband's—his secretary, he was called—a sort of instrument for unprincipled purposes. Of character or position he has not even the shadow. Where he comes from, who he is, or what he is, it is impossible to say. I only know him in the position of which I have spoken. I am sure he has never had a better one."

Mrs. Annesley looked horror-stricken.

"And it was *this* man who wrote to me as the friend or relation of Miss Tresham!—it is *this* man who is here now to see her!"

"It is this man."

"And you—you let Morton go without telling him?"

"I told him much more than I have told you, and it had no effect upon him. Stop, Elinor"—as Mrs. Annesley, in uncontrollable agitation, rose to her feet—"you can say nothing to Morton that I have not already said. We have no proof of any thing beyond mere acquaintance between Miss Tresham and St. John. Think a moment. Did his reply to your letter contain nothing more?"

"I don't need to think," answered Mrs. Annesley, impatiently. "It contained not one word. Do you suppose I should have permitted matters to go on as long as they have in this way, if I had been able to produce a word of proof against her? My God! to think how helpless I am!" said she, striking her hand heavily on the end of the sofa near which she sat. "To think that this artful creature may make Morton marry her any day, and then—discovery would come too late."

"Have more faith in Morton," said her companion, gravely. "Believe, as I believe, that he will not take any extreme step, without giving you fair warning. In the mean time, you must endeavor to find out something about Miss Tresham."

"But how?"

"Do I need to tell you how? Is not St. John here, and have I not described his character? You need feel no delicacy about approaching him."

"But this is more difficult than you think," said Mrs. Annesley, hesitatingly. "Morton would never forgive me if he knew of such a thing, and how am I to see the man without his knowing it?"

"I have simply pointed out the way," said Mrs. Gordon. "The means I leave to yourself."

"But you—you know this St. John. Could not you—"

"No," answered Mrs. Gordon, with forbidding coldness. "Nothing would induce me to see or hold any communication with him."

"Not even for Morton's sake?"

"Not even for Morton's sake."

There was no appeal possible from that decided tone. Mrs. Annesley saw that, whether for success or failure, she must act for herself. After a minute's consideration, she said:

"Can you tell me where I shall find Mr. St. John?"

"It is probable that Babette can," said Mrs. Gordon, ringing the bell.

Babette appeared, and proved at once the accuracy of her mistress's judgment. She was able to gratify Mrs. Annesley with every possible particular concerning Mr. St. John; and, after that lady had heard all that could be of service to her, she dismissed her informant, and turned to Mrs. Gordon.

"I don't see my way at all clearly, Pauline," she said. "But I hope you will remember that I am acting according to your advice."

"According to my suggestion," amended Mrs. Gordon. "I never give advice, Elinor."

"If Morton discovers it, he will never forgive me."

"If you are so much afraid of Morton, you had better let him go his own way without interference."

In reply to this, Mrs. Annesley rose from her seat.

"One word, Pauline," she said, as her cousin rose also. "Have you told Morton about those letters?"

"No; why should I?"

"You will not do so?"

"I have not the least intention of doing so."

"Thank you," said Mrs. Annesley, impulsively. Then she added, with more of her usual manner: "My dear Pauline, no words can say how sorry I am that *my* act should have brought so much annoyance upon you. Can you possibly forgive me for it?"

"There is nothing to forgive," answered Mrs. Gordon. "When you wrote that advertisement—last summer, was it not?—you could not possibly have thought or known of me. Are you going?"

"I must. It is getting late, and I fear I shall not be back at Annesdale in time for dinner. I will come to see you soon again. Would you advise—that is, would you suggest, that I should offer money to this St. John?"

"I can only say there is no reason why you should hesitate to do so."

Mrs. Annesley repeated her thanks, and took leave. Once in the carriage, she looked at her watch and made a calculation of time, with reference to dinner. Having made it, she pulled the check-string and said: "Tallahoma—Mrs. Marks's."

Poor Mrs. Marks had barely done more than recover from the combined effects of Morton's visit, and her husband's unusual assertion of himself, when this new astonishment was prepared for her. Having seen the table finally cleared off, and having rid herself of the children by dispatching them in a body to the "old field," of which mention has before been made, she sat down with a very heavy heart, to darn various small stockings full of various large holes. As she darned, she sighed; and, in fact, sighs were more frequent than stitches with her. The kind soul was lamenting her husband's resolution, and grieving much over the loss of her favorite, "Miss Katharine." She even shed a few tears, and wiped them away with the leg of Jack's sock. Impatient thoughts on the perversity of human circumstances came to her, as they had come to Katharine at Annesdale, as they come to all of us when people and events prove "contrary." Oh, why cannot things go right? Why cannot people act as they ought to? Why cannot circumstances cease to fret, or goad, or restrain us? What is the reason that every thing has its dash of bitterness, and that life seems to vibrate, like the pendulum of a clock, continually, between the painful and the disagreeable? This is the strain of thought that is going up to heaven on the wings of every minute, like the broken cry of an imprisoned spirit, panting, ah! how vainly, to be free. What is the good of it all? Ah! granted—what, indeed, is the good of it all? But then, friends, dwellers upon the earth, co-heirs of the curse laid on Adam, the question is, not what is the good of it, but how are we to help it? There is but one way known to men—the way of childlike faith—and few of us are great enough, or strong enough, to follow that.

Mrs. Marks was still darning, still heaving sighs, and still dropping a tear or two occasionally, when she was startled by the sound of a knock at the door. The dining-room was in the back part of the house, and so it chanced that she had neither seen nor heard the arrival of the Annesley carriage; so it chanced, also, that, with her work in her hand, she went out to answer the knock, and found herself face to face with no less a person than Mrs. Annesley.

Her consternation was almost as great as her surprise. The fear of something additionally disagreeable—a fear vaguely inspired by Mrs. Annesley's face—instantly seized her. Somehow or other, the greeting was accomplished, and Mrs. Annesley was ushered into the dining-room. When she had been installed in the most comfortable chair, and Mrs. Marks was sitting opposite, with her darning mechanically retained in her hand, a few remarks were exchanged, and then the visitor opened the serious business of the occasion.

"No doubt, you are surprised to see me, Mrs. Marks," she said, graciously. "In fact, I ought to apologize for such a startling visit. But, being in Tallahoma, I thought I would stop for a few minutes; and I also thought that I might find Morton here. I am anxious to see him on a matter of business before he returns to Annesdale."

"I am very sorry that you have come a little too late," said Mrs. Marks, with the utmost sincerity. "Mr. Annesley was here, but he left a short while ago; and I think he said he was going back to Annesdale."

"He was here, and left only a short while ago! Oh, how provoking!" said Mrs. Annesley. "What an instance of my bad luck! But pray, Mrs. Marks, what does a 'short while' mean? Do you think, for instance, that I could overtake him before he gets home?"

"Oh, no. I am sure you couldn't," said Mrs. Marks, with decision. "It's been a good hour since he left, and he must have reached Annesdale by this time—or, indeed, before this. He didn't stay long," she went on, telling of her own accord the very thing Mrs. Annesley was anxious to hear. "He called to see Miss Tresham, and, Miss Tresham not being at home, he left very soon."

"I thought Miss Tresham was at home," said Mrs. Annesley, a little stiffly. "She left Annesdale this morning."

"She came here this morning," said Mrs. Marks, in an aggrieved tone, "but she is gone now."

"Gone!" Mrs. Annesley simply opened her eyes. It could not be possible that exposure had come so soon, and come of itself? "Gone! Excuse me, but you surprise me very much. I thought she came back to recommence teaching."

"She went to Saxford to-day," answered Mrs. Marks, unconsciously lifting the stocking, which she still held, to her eyes, from which one or two tears were drawn forth by that oft-repeated statement. She stood extremely in awe of the elegant mistress of Annesdale, but the latter was a woman, after all, and she had dropped in to pay a sociable visit, and Mrs. Marks's heart was sorely in need of a *confidante*, and so she began to open the floodgates of her feelings, and to express in words what she had heretofore only expressed in sighs.

"She went to Saxford," she repeated—very much as she might have said, "She went to be buried!"—"It is hard on me, Mrs. Annesley—it is certainly hard on me! I never meddled with Miss Tresham's affairs in my life—I never said a word, either to her or to anybody else, about them—and yet you'd hardly believe all the trouble and worry that's been in this house this day—all on account of Miss Tresham's affairs, and Miss Tresham's visitors, and because Miss Tresham has taken it into her head to go to Saxford!"

"But why has she gone?" asked Mrs. Annesley, with a very un-civil disregard of Mrs. Marks's personal grievances.

"Everybody asks me that," answered Mrs. Marks, "and Miss Tresham told me no more about why she was going than she told my little Nelly playing out in the yard. I am sure it seemed natural enough to me that she should go—she often does go to see her priest—but everybody seems surprised about it, and Mr. Marks is so provoked that he says if she don't come back on Monday, and if she won't explain every thing about Mr. St. John, she"—second application of the stocking as a pocket-handkerchief—"will have to leave us."

This good news was so unexpected, and so startling, that for a minute Mrs. Annesley scarcely realized it. Then a glow of satisfied pleasure began to steal over her, and she saw how well Fate was fighting the battle of which she had been almost ready to despair.

"Really, you astonish me!" she said. "I had no idea of any thing like this. Miss Tresham only left my house this morning, and now to have gone away so unexpectedly—and, you say, without any explanation?"

"Without even so much as a word of explanation," answered Mrs. Marks, who was now fully launched into her theme. "Perhaps I ought to have said something to her, Mrs. Annesley; but my head was quite upset—and then she was in such a hurry to get to the hotel before the stage left that she didn't give me time hardly to breathe. I'm sure I didn't pay any attention to what Mrs. Gordon said about her—I mean"—hastily correcting herself with a timely recollection that Mrs. Gordon was Mrs. Annesley's cousin—"that I felt confident there was some mistake—but it seems to me all the same, that Miss Katharine might have told me something before she left, so that I could have explained it to Richard. But she never said a word."

"Nothing about Mr. St. John?"

"Not a syllable."

"How extremely singular!" said Mrs. Annesley, very slowly and very gravely—so gravely that Mrs. Marks began to feel as if she had much underrated the importance of Miss Tresham's reticence, and Miss Tresham's departure. It was astonishing how infinitely more Mrs. Annesley's opinion on the subject weighed with her, than that of her husband had done!

"It was strange," she said, "though I didn't think of it at the time. Miss Katharine is so nice, Mrs. Annesley, and we are all so fond of her, that somehow it never struck me that—that, as you say, it was singular for her to give no explanation about Mr. St. John."

"Perhaps he may be related to her," said Mrs. Annesley, carelessly—she began to be aware that she had betrayed more interest than it was proper to show in Miss Tresham's affairs—"your governess herself is a very lady-like person; but people in her position often have very disreputable relations, you know."

"Mr. St. John is very much of a gentleman, indeed," said Mrs. Marks, greatly astonished. "I am sure nobody could say that there is any thing disreputable about him. But I don't think he is any relation of Miss Katharine's; that is"—a short pause—"I really don't know. I never heard her say that she had any relations."

Mrs. Annesley knew this before, but none the less did she think it necessary to look as much shocked as if she heard the statement for the first time.

"No relations!" she exclaimed. "A girl of her age! Why, that is dreadful! Really, Mrs. Marks, you must excuse me if I say that I wonder very much at your courage in engaging such a person to enter your house and teach your children."

By way of reply, Mrs. Marks only stared. It had yet to dawn upon her comprehension that the misfortune of having no relations could possibly be made a social crime.

"It is hard on a young thing like Miss Katharine"—she began, when Mrs. Annesley interrupted her in her grandest way.

"It is not of Miss Tresham I am talking, Mrs. Marks, but of her position. Of course, it is only reasonable that when a girl of her age, and I suppose I may say of her refined appearance, talks of having no relations, she simply means one of two things—either that her relations do not acknowledge *her*, or else that they are themselves not fit to be acknowledged. In either case, as I remarked before, I think you must possess a great deal of courage to admit her to your family as you have done, and to be willing to trust her as you seem disposed to do. For my part, I confess that I should shudder to think of assuming such a responsibility; but then my conscience is very sensitive."

"She was so nice," said Mrs. Marks, deprecatingly, much impressed by this forcible view of the matter, and much aghast at being brought in guilty, by implication at least, of a callous conscience.

"So nice!" repeated Mrs. Annesley, in a tone of overpowering scorn. She forgot herself and her part, for a moment, and let the real earnestness which she felt come to the surface, as the thought rushed over her that all the trouble now weighing upon her, all the fear that had made her life wretched for months past, resulted from the act of this woman—this woman so far out of her life, so apart from all her associations. She had scarcely done more than bow to Mrs. Marks when they chanced to meet, once a year or so, on the village street, and yet the fateful sisters had thrown their shuttle, and across the warp and woof of her own life had woven the threads of this other homely existence. Common as such things are, when they come home to us as they came home to her, it is hard not to feel startled by them—hard to realize that they form the daily history of that which we call circumstance! Two strangers met by chance in the parlor of that Charleston hotel; the girl's face brightened into a winning smile, and the elder woman's heart was touched; a few words were said, and lo! the whole current of life was changed, not only for them, but for others then scattered in widely-different corners of the civilized world, then going each his different way, laughing, talking, smiling, weeping, perhaps, and knowing not what had been done—knowing not that, on a single breath, as it were, every aim and purpose of existence had been staked and changed—for better or worse, who could tell? Surely only He of whom it is well to think in the midst of such reflections as these—He who draws us each into our appointed path, and does not leave us to be the blind victims of a merciless Chance.

"I beg your pardon," said Mrs. Annesley, recovering herself with a faint, forced laugh. "I suppose, of course, you think Miss Tresham nice, but I was really unable to discover her attractions. What a beautiful view this room has! Do you cultivate your garden much?"

She rose and walked to the window. Well disciplined as she was, and thoroughly accustomed to self-control, she could not have sat still a moment longer and face the woman who had brought all this anxiety and possible grief upon her. An outbreak of some sort must have come, and she wisely prevented it by walking away and gazing absently into the garden, while Mrs. Marks willingly forsook the subject of Miss Tresham for that of her celery and winter lettuce.

As she talked, Mrs. Annesley's fertile brain ran over expedient after expedient for seeing St. John, and dismissed each as impracticable. How was she to do it?—*how* was she to do it? This was the accompaniment in her brain to Mrs. Marks's conversation. Yet she was as far as ever from the solution of her difficulty, and she almost began to despair of its accomplishment, when she accidentally caught sight of a man's head above a rose-bush in the garden. In a second, she felt sure that, by some strange coincidence, her opportunity was here, ready to her hand—that St. John stood before her.

She did not stop to consider why she knew that it was he, she did not think for a moment how he came there. She only felt, by a strange, intuitive thrill, that her desire was gratified more speedily and more completely than she could possibly have hoped for it to be, and that, come what would, she must seize the fortunate opportunity.

Yet how could she escape? how get rid of Mrs. Marks? That became as great a difficulty now as the means of meeting St. John had been before. As she asked herself the question, however, she

saw that there was no need of immediate haste. Plainly, St. John had entered the garden to bide his time, and plainly he meant to wait till that time came. His head had now disappeared from above the rose-bush, but Mrs. Annesley marked the place where she had seen it, and a thin, pale wreath of smoke, which now and then floated up, sufficiently indicated his present position, and sufficiently proved how he was whiling away the period of waiting.

"What is he waiting for?" Mrs. Annesley began to consider. "Is it Miss Tresham, or is it to come in and see Mrs. Marks?—Ah!"—as a sudden recollection flashed over her—"it is for *me* to leave. He sees the carriage before the gate, of course, and he has decided to remain in the garden and smoke a cigar until the coast is clear. There could not possibly be a better opportunity for seeing him, if only I could get rid of this horrid woman! But how on earth am I to do that?"

How, indeed! For, while the blue smoke floated pensively over the rose-bushes, and while Mrs. Annesley could scarcely keep her impatient hand from the latch of the door near which she stood, Mrs. Marks steadily held her ground, and steadily poured forth her flow of language with a profound unconsciousness that seemed as if it could be shaken by nothing less than a moral earthquake.

[TO BE CONTINUED.]

ON VARIETY AS AN AIM IN NATURE.

BY THE DUKE OF ARGYLL.

IN No. 2, Vol. I., of the *Journal of Travel* there was an article by Mr. Wallace, applying the Darwinian theory of Natural Selection to the architecture of birds, and professing to explain thereby the varieties and peculiarities in the structure of nests.

As that explanation appeared to me altogether fanciful and erroneous, I contributed to the same journal a paper, in which the argument of Mr. Wallace was contested. In that paper the following passage occurs: "I am more and more convinced that variety, mere variety, must be admitted to be an object and an aim in Nature; and that neither any reason of utility nor any physical cause can always be assigned for the variations of instinct."

Mr. Darwin, in the work just published upon the *Descent of Man*, quotes this passage, and makes upon it the following comment: "I wish the duke had explained what he here means by Nature. Is it meant that the Creator of the universe ordained diversified results for His own satisfaction, or for that of man? The former notion seems to me as much wanting in due reverence as the latter in probability. Capriciousness of taste in the birds themselves appears a more fitting explanation."

I respond the more readily to the challenge of Mr. Darwin because the question which he puts to me, and the objection which he makes, involve points of the highest interest in philosophy and in theology.

Let me say, then, at once, that I meant precisely that which appears to him irreverent; I meant that variety, for its own sake—variety of form, of beauty, and of enjoyment—has been a purpose of the Creator in His creative work. The dislike which Mr. Darwin expresses to this belief is the more remarkable considering his own idea of the rank which the Law of Variation takes in the methods and in the history of creation. The inexhaustible variety of Nature has been, indeed, long observed. As a fact it stares us in the face in all the phenomena of the world. But it was reserved for Mr. Darwin to fix upon an innate, universal tendency in all species to vary, as the cardinal fact upon which turns the origin of species, and the whole system on which organic life has been developed from the lowest to the highest forms. It is—according to him—out of the accidental variations which have been perpetually arising that certain varieties have been "selected," because of these being the fittest to survive. But these variations must happen before they can be "selected." And so Mr. Darwin has been led to accumulate a mass of evidence to show that an inherent tendency to variation is a great general law of fundamental importance in the history of life, and furnishes the only and the sufficient key to the rise and progress of all its complicated structures.

If this be so—if the Law of Variation be indeed of such primary importance in the work of creation—how can it be "irreverent" to

hold that the establishment of this law has been an object and an aim of the Creator in the work which has been accomplished by it? The further back we push the idea of a Creator, and the more we conceive His "interference" to be limited to the ordaining of "laws," the more certain it becomes that in these laws at least, if anywhere, we have the expression of His mind and will.

Into what, then, does the objection of Mr. Darwin really resolve itself?

There seems to me to be but one answer to this question. The objection of Mr. Darwin is founded on that disposition—so old in the history of philosophy, and now so much revived—to dismiss as "Anthropomorphic" every conception of the divine character and attributes which brings them into conceivable relation with even the highest character and attributes of man. This is part of the philosophy of Nescience, and this is the point to which I wish to direct myself in the present paper.

I am under no necessity of arguing with Mr. Darwin on the existence of a Creator. I have never thought that his special theories on the methods of creation are inconsistent with theism. He himself repudiates such antagonism. "The birth both of species and of the individual are equally parts of that grand sequence of events which our minds refuse to accept as the result of blind chance. The understanding revolts at such a conclusion."* In the passage also on which I am now commenting, Mr. Darwin assumes the existence of a Creator, and assumes, moreover, that there is some standard by which we may judge what is reverent and irreverent to think concerning Him.

What is this standard? Mr. Darwin has asked me one question which I have answered plainly. May I ask him to be good enough to answer that other question which I have now put, and to follow me for a short time in certain considerations which bear upon the reply?

If there be a Creator, there seems to be only two possible sources of information from which we can derive any knowledge of His character—one source is to be found in the nature and character of His works; the other source is to be found in direct revelations from Himself, if such exist.

Looking, then, to the creation as the Creator's work, the first thing to be observed is that the highest thing in it is the mind of man. If, therefore, there be any work in Nature which reflects any image of the Creator, the human mind is that work. Nor is there any difficulty in conceiving how such an image may be true and yet be faint—how it may be real and yet be distant. For nothing in the human mind is more wonderful than this, that it is conscious of its own limitations. The bars which we feel so much, and against which we so often beat in vain, are bars which would not be felt at all unless there were something in us against which they press. It is as if these bars were a limit of opportunity rather than a boundary of power. It is as if we might understand immensely more than we can discover—if only some one would explain it to us! There is hardly one of the higher powers or faculties of our mind in respect of which we do not feel daily that we are tied and bound by the weight of our infirmities. Therefore, we can have no difficulty in conceiving all our own powers exalted to an indefinite degree. And thus it is that, although all goodness, and power, and knowledge, must be conceived of as we know them in ourselves, it does not follow that they must be conceived of according to the measure which we ourselves supply.

These considerations show, first, that, as the human mind is the highest created thing of which we have any knowledge, its conceptions of what is greatest in the highest degree must be founded on what it knows to be greatest and highest in itself; and, secondly, that we have no difficulty in understanding how this image of the Highest may and must be faint, without being at all unreal or untrue.

And if this conclusion is forced upon us by the very nature of our own mind, it is a conclusion abundantly confirmed by the relation in which our mind stands to the rest of Nature—that is, to the other works of creation. Every hope we cherish, and every success which we attain in physical investigation, depends upon the fact that we can succeed, within certain limits, in discovering and in understanding the order of Nature—which fact has no other meaning than this, that the laws of Nature are so related to our faculties as to

be recognizable and intelligible in the light which they supply. And the highest light which these faculties do supply is that by which the mind recognizes in Nature the working of a spirit like its own. Hence it is that the question "What?" is ever instinctively followed up by the question "How?" and this again by the final question "Why?" In whatever degree and measure this last question can be answered, in that degree only do we reach an explanation. Hence the perpetual recurrence in the descriptions of naturalists of those forms of expression which bring the phenomena they describe within the conception of purpose, and translate the facts of fitness and adaptation into the familiar language of design. I have already pointed out* how largely Mr. Darwin has drawn on this language as the fittest, if not the only language, by which the facts can be described.

Mr. Mivart has, indeed, lately remarked, in a very able work,† that this teleological language is, when used by Mr. Darwin, purely metaphorical. But for what purpose are metaphors used? Is it not as a means of making plain to our own understandings the principles of things, and of tracing, amid the varieties of phenomena, the essential unities of Nature? In this sense, all language is full of metaphor—that is to say, of words which transfer and apply ideas gained in one sphere of investigation to another, because there also the same ideas are seen to be expressed in some other form. When Mr. Darwin uses metaphorically the language of contrivance and design, he must use it as a help to the understanding of the facts. When, for example, he tells us of the traps and triggers which are set in orchids; that they are constructed and set, "in order that" they may catch the probosces of moths or the backs of bees, he does not mean that the plan and scheme of vegetable physiology have been explained to him by the Creator. He means only that the traps and triggers are, as a matter of fact, so set that they do catch the probosces of moths—that these do again convey the pollen to other flowers, by which they are fertilized; and that all this elaborate mechanism is "as if" it had been arranged "in order that" these things might happen. Exactly so; that is to say, the facts of Nature are best brought home to, and explained to, the understanding by stating them in terms of the relation which they obviously bear to the familiar operation of the mind and spirit.

And this is the invariable result of all physical inquiry. In this sense Nature is essentially anthropomorphic. Man sees his own mind reflected in it—his own, not in quantity, but in quality—his own fundamental attributes of intellect—and, to a wonderful degree, even his own methods of operation. In particular, mechanical contrivance, which he knows so well, and in which he takes so much delight, is one universal character of creation. It is as if the Creator had first laid down a few simple laws—that is to say, had evolved a few simple elementary forces, and had then worked from these with boundless resources of constructive skill.

I do not know that the discoveries of modern science, great as they have been, and much as they are vaunted, have contributed any thing toward the solution of the final problems of all human speculation. These, in so far as mere speculation is capable of dealing with them, seem to remain very much where the great intellects of the ancient world found them and left them. But, short of these final problems, there are two impressions which the progress of discovery has largely tended to teach and to confirm. One is the universal prevalence of mechanism in Nature; and the other is the substantial truthfulness of the knowledge we derive from that most wondrous of all mechanisms—the mechanism of the senses. And this last is a matter of immense importance. For all that we know of matter is so different from all that we are conscious of in mind that the whole relations between the two are really inconceivable to us. Hence they constitute a region of darkness in which we may easily be lost in an abyss of utter skepticism. What proof have we, it has been often asked, that the mental impressions we derive from objects are in any way like the truth? We know only the phenomena, not the reality, of things; we are conversant with things as they appear, not with things as they are "in themselves." What proof have we that these phenomena give us any real knowledge of the truth? How, indeed, is it possible that knowledge so "relative" and so "conditioned"—"relative" to a mind so limited, and "conditioned" by senses which

* "Descent of Man."

* "Reign of Law."

† "Genesis of Species," by St. George Mivart.

tell of nothing but sensations—how can such knowledge be accepted as substantial? Is it not plain that our conceptions of creation and of the Creator are all mere “anthropomorphism?” Is it not our own shadow that we are always chasing? Is it not a mere bigger image of ourselves to which we are always bowing down? I know of nothing in philosophy better calculated to disperse these morbid dreams than to breathe the healthy air of physical investigation and discovery. Although here, also, the limitations of our knowledge continually haunt us, we gain, nevertheless, a triumphant sense of its certainty and its truthfulness. Corroboration follows on corroboration, to assure us that we have a hold on truth.

It is impossible to place too high a value on the work which science is doing in this direction. It is a service which has not yet, I think, been sufficiently noticed or appreciated. Let us take an example. Up to a very recent period, light and sound were known as sensations only—that is to say, they were known in terms of the mental impression they produce, and in no other terms whatever. They were not known “in themselves.” There was no proof that in the sensations we had any knowledge of the unknown reality which produced them. But now all this is changed. Science has not, indeed, bridged the gulf which separates mind from matter; it has not explained to us, and it never will, what is the method of contact between the mind and the organism through which the mind is informed; but it has discovered what these two agencies of light and sound are “in themselves”—that is to say, it has defined them under aspects which are totally distinct from seeing or hearing, and is able to describe them in terms addressed to wholly different faculties of conception. That which we call light is a series of undulations in some ethereal elastic medium, to which undulations, or rather to a certain portion of them, the retina is “attuned,” and which, when they reach that organ, are “translated” into the sensation which we know. These are the words used by Professor Tyndall to describe the facts. They are “metaphors” only in the sense in which the highest expressions of truth are always metaphorical. We know that light is, as it were, a translation from one language to another. And now it appears that the facts, as described to us in this language of sensation, are the true equivalent of the facts as described in the very different language of intellectual analysis. The eye is an apparatus for enabling the mind instantaneously to appreciate differences of motion which are of almost inconceivable minuteness. The pleasures we derive from the harmonies of color and of sound, although mere sensations, do correctly represent the movement of undulations in a definite order; while those other sensations which we know as discords represent the actual clashing and disorder of interfering waves. Thus the mental impressions which our organs have been constructed to convey are a true interpretation of external facts. The mirror into which we look is a true mirror, reflecting accurately, and with infinite fineness, the realities of Nature.

And this great lesson is being repeated in every new discovery, and in every new application of an old one. Every triumph of modern science is a refutation of the bad metaphysics out of which the sickly fancies of nescience have arisen. Every reduction of phenomena to ascertained measures of force; every application of mathematical proof to theoretical conceptions; every detection of identical operations in diverse departments of Nature; every subjection of material agencies to the service of mankind; every confirmation of knowledge acquired through one sense by the evidence of another—every one of these operations adds to the verifications of science, confirms our reasonable trust in the faculties we possess, and assures us that the knowledge we acquire by the careful use of these is a substantial knowledge of the truth.

Such considerations may well inspire us with some confidence that the impressions which we derive from Nature of the Creator's character are not untrue because they are necessarily conceived in the terms of human thought. Doubtless, they are imperfect and incomplete; for this, indeed, our own faculties tell us they are and must be. But all reason and analogy assure us that they contain some real and solid representation of the truth. Let us not be scared, then, by this terror of anthropomorphism, which, under the aspect of humility in respect to ourselves, is, when we come to analyze it, really based on utter distrust of the truthfulness of God. If we cannot believe in the relations which he has established between the mind of man and the rest of his creation, we can believe in nothing. We are ourselves “magnetic mockeries” in a world of lies.

And well may we reject this fear of anthropomorphism when we recollect the result of all past endeavors to construct an idea of God which should be, as far as possible, removed from the image of man. The pale, impassive deities of the Lucretian Olympus are, I suppose, the only alternative conception we can form. They are far enough removed, assuredly, from the creation, as we see and know it—a creation so full of movement and of effort, of designs conceived, and of difficulties overcome.

... “The gods, who haunt
The lucid interspace of world and world,
Where never creeps a cloud, or moves a wind,
Nor ever falls the least white star of snow,
Nor ever lowest roll of thunder moans,
Nor sound of human sorrow mounts to mar
Their sacred, everlasting calm!”

I need not say that such conceptions as these of the divine Nature do not escape from anthropomorphism. The only difference is, that they take as their pattern a maimed and morbid humanity instead of the humanity which Nature actually presents.

I have no right to assume that all whom I address in this paper will admit that there is any appeal from the evidence of Nature on these subjects to the evidence of any special revelation on the character of the Creator. But at least I may assume that, if there be such a revelation, it is to be found in the Hebrew and in the Christian Scriptures. No higher conception of the divine Nature than the conception which they present has been, or can be, formed. At least, if there be such a conception, I do not know where to find it. We must be satisfied with what has been written in the Prophets and in the Psalms concerning Him. I cannot find any standard of reverence, whether new or old, better than the standard which they supply. They reflect both those aspects of the truth which are so striking in Nature. On the one hand they assert the unsearchableness of God. On the other hand they assert, as strongly, the intelligible relation which He bears to the human spirit. And in their language, whether in the Old or in the New Testament, I find no fear of such representations of the Creator in reference to His works as I ventured to use in the passage which has been condemned by Mr. Darwin. There, at least, it is not considered irreverent to speak of God as taking pleasure in the works of His own hands. “For thy pleasure they are and were created.” Variety is one of the most notable facts in Nature. I repeat, therefore, once more, my belief that this variety—variety of form, of beauty, and of enjoyment—appears to have been an object and an aim in the creative mind.

I cannot conclude this paper without an expression of respect for the rare candor with which Mr. Darwin confesses that, in his work on the Origin of Species, he underestimated the number and variety of organic structures which have no positive utility, and cannot, therefore, have been either originated or preserved through the influences of “natural selection.” For these structures—subserving mainly the purposes of ornament—he now accounts by what he calls “sexual selection.” I have no leisure now to state all the facts and arguments which appear to me to disprove this theory. Many of them are stated with admirable force in Mr. Mivart's work. But I may simply observe that, as Mr. Darwin himself confesses, the propagation of organic forms takes place throughout extensive provinces of Nature under conditions which exclude altogether the element of choice on the part of either male or female. When we consider that these conditions apply to the whole vegetable kingdom, and to extensive subdivisions of the animal kingdom also, and when we consider how enormous in these is the development of forms which are splendidly ornamented, we have some measure of the utter inadequacy (to say the least) of the explanation which Mr. Darwin has suggested. It would seem to be an elementary principle in reasoning on such subjects that phenomena cannot be ascribed to a particular cause which is not co-extensive with its assumed effects.

THE BURIAL OF LATANÉ.

A RIDE with his force, Jeb Stuart
Around the enemy made;
He carried the torch and the sabre,
And ruin followed the raid.

Just fourteen hundred horsemen
Went out that summer day;
One only stayed behind us;
But that one was Latané.

We met some Federal riders—
Not many, but brave and stout—
Under their captain, Royall;
And they stayed to fight it out.
Gayly we spurred to meet them,
And foremost in the fray,
At head of his squadron riding,
Was the daring Latané.

The strife was stern and bloody,
The struggle was quick and hot;
A sudden clashing of sabres,
A rattle of pistol-shot.
One went down in the skirmish,
One of our side, that day—
Death loves to strike the bravest,
And the dead was Latané.

We mourned the loss of our comrade,
Though death was familiar then;
And tears fell fast as we passed him,
From the eyes of bearded men.
But we left him in charge of his brother,
While we rode slow away—
Our horses' tramp and scabbards' clank
Were the dirge of Latané.

When we had gone, the foemen
Swooped down with a troop of horse
To the gate of the old plantation,
Where the brother had borne the corse.
They carried away that brother—
He was killed on another day—
And forbade the priest and the service
To the body of Latané.

Hedged by the Federal forces,
While none of ours remain—
Shall no funeral-rites be given
To the chief untimely slain?
Buried without the ritual,
The cold and pallid clay,
And covered in mode unseemly,
The form of Latané?

The brave among the bravest,
In a desperate cause to die,
Shall the foe in sullen anger,
The honors of death deny?
Keep back the priest with sabres,
Ye shall not win your way,
While a kind Virginia matron
Is the friend of Latané.

A fair Virginia matron,
Worthy the name she bore—
A matron proud and stately,
Summoned her maidens four.
Daughters of Giles and Waller,
Of Pegram and Paul, that day
Followed the shrouded figure
Of the gallant Latané.

Under the oak-trees' shadow
The faithful servants bore
The dead and silent captain,
Whose sword may flash no more—

Bore in a sad procession,
Down through the leafy way,
The rude and hasty coffin
Of the lifeless Latané.

And there, while tearful maidens
And pitying servants stood,
In voiceless grief and sombre,
Beneath the spreading wood,
The matron's voice ascended
To the heaven above, that day,
In the prayer the Church had given,
For the soul of Latané:

"Earth to earth, and ashes
To ashes, and dust to dust—"
The body to earth, and the spirit
To God in an humble trust.
They heaped the dark soil over,
And, till the judgment-day,
They left to lie and moulder
The body of Latané.

There lie, in state, some corpses
Beneath a lofty dome,
And then, with the rolling drum-beat,
Are borne to their final home.
He sleeps as well in his coffin
Who is earthed in another way;
And the angel's trump will surely waken
The spirit of Latané.

THE AUTHOR OF "VIVIAN GREY" AND "LOTHAIR"—A CONTRAST.

FROM "LONDON SOCIETY."

IT is the height of the London season some forty years since, and we are standing in a long library in Lady Blessington's mansion in Seamore Place, whose sides are alternately covered with rows of magnificently-bound books and gorgeously-framed mirrors. The window, which is deep and runs the entire breadth of the room, opens upon Hyde Park. We have before us a letter, written by a gentleman at the time, describing his introduction to Lady Blessington in this very room, and from that letter we will venture to quote: "The picture to my eye as the door opened was a very lovely one; a woman of remarkable beauty, half-buried in a *fauteuil* of yellow satin, reading by a magnificent lamp suspended from the centre of the arched ceiling; sofas, couches, ottomans, and busts, arranged in rather a crowded sumptuousness through the room; grand tables covered with expensive and elegant trifles in every corner; and a delicate white hand relieved on the back of a book to which the eye was attracted by the blaze of its diamond rings. As the servant mentioned my name, she rose and gave me her hand very cordially, and, a gentleman entering immediately afterward, she presented me to Count d'Orsay, the well-known Pelham of London, and certainly the most splendid specimen of a man, and a well-dressed one, that I had ever seen."

There was no other room in Europe which could boast of witnessing more brilliant *réunions* than those which were then in the habit of frequently assembling in that library in Seamore Place. The *salon* glitters with stars, and is resplendent with orders of every kind. Not a nation of the civilized world is without its representative. There are foreign counts, who have achieved eminence, and who speak every European language, *attachés*, ambassadors, and princes. There, stands the greatest capitalist in the world, the original, possibly, of Sidonia of "Coningsby" fame; and there, in groups at intervals round the apartment, are met together all that is most eminent in every possible department and kind of excellence and skill in England. Mr. Lytton Bulwer, who has just won his spurs by his novel "Pelham," enters with an attractive frankness, and is received with *empressement* by the

• N. P. WILLIS.

noble hostess. That speaker yonder with the merry eye and the Bacchus head is Tom Moore, criticising the *personnel* of the English House of Commons, and discussing the condition of Ireland. "The great period of Ireland's glory," you may hear him say, "was between '82 and '98, and it was a time when a man almost lived with a pistol in his hand." A volley of well-bred laughter draws your attention to another portion of the room; you look up and you see Theodore Hook, the Lucian Gay of "Coningsby," with his hand on Lord Canterbury's sleeve, narrating the incidents of the last practical joke, or expatiating upon the theme of some new political squib for the "Examiner." A little bit to the left you have Horace Smith, one of the authors of rejected addresses, playing rather an *aside* in the conversation, interpolating a pun or a witticism whenever he gets a chance, but more a listener than a talker. There is a famous traveller just returned from Constantinople; and there, Henry Bulwer (to-day Lord Dalling) discussing with great earnestness the last speech of Daniel O'Connell. Scattered about the room are such men as Lord Lyndhurst, Sir Robert Peel, Lord Strangford, Sir Thomas Lawrence, Henry Luttrell—the "wit among lords, and the lord among wits"—the Hon. W. R. Spencer, and Captain Marryat.

Two persons of different ages and different appearance, indeed, yet not without a strong mutual resemblance of feature, enter, and remind us by the announcement of their names that we have already delayed too long over the preliminaries of the subject of this article. The pair are Mr. Disraeli the older and Mr. Disraeli the younger; and Lady Blessington receives them both with conspicuous welcome. It was only the other day that her ladyship was mentioning to a visitor how delightful it was to witness the old man's pride in his clever young son, and the son's respect and affection for his father. Mr. Disraeli *père* is just now engaged in collecting materials for an exceedingly elaborate and comprehensive "History of English Literature"—one of those books, unfortunately, which are destined never to advance beyond the stage of design. Mr. Disraeli *fils*, Disraeli "the younger," as you may read his name on the title-page of his new (and soon to be issued) volume, has lately made a triumphant successful *début* in the arena of authorship. "Vivian Grey" is the talk of the town. Who is the Marquis of Carabas? Can it be possible that Lord Courtown is really Sir —? And does the dangerous young author mean by Mr. Cleveland none other than —? And then who are all German duchy celebrities? And, if it comes to that, who is "Vivian Grey" himself? These are the questions which sapient

London is asking itself, and every day rejecting answers by the score, or framing new ones which are certain to meet with a similar destiny of repudiation to-morrow.

Just at this moment we will not puzzle ourselves with the interrogations as to who Mr. Vivian Grey is or is not: we may as well occupy ourselves with taking some personal observations as to the creator of Mr. Vivian Grey. And there he stands—"Disraeli the younger." He has taken up his position in front of hostess's mantel-piece, and you may note the clever young man at your leisure. Every one is looking at him to-night; for Mr. Benjamin Disraeli has made a sensation, and sensation is what society loves, and of whose author it invariably makes a hero.

It is possible that if we were to project ourselves somewhat forward in the course of time, and to glance at the costume of Mr. Benjamin Disraeli by the light of some ridiculously advanced date in the world's history, say A. D. 1871, if our island is not by that time sunk deep in the sea's profound, we should pronounce it a trifle peculiar, antiquated perhaps. Now it is simply the highest mode and the newest fashion, for the famous young author of "Vivian Grey" has a dash of the dandy about him. But, after all, it is the face which attracts and even fascinates you more than the dress. A countenance lividly pale—till you hear the ringing voice and know the energy of the lungs which it implies, you might fancy the brilliant young writer was the victim of a slowly but fatally wasting consumption—eyes black as the night, that glisten forth from their recesses with an expression of mingled mockery and ambuscade; a lofty forehead, and an unmistakably intellectual brow, above which is an opulent mass of jet-black hair, flowing in ringlets over his left cheek to his almost collarless stock, while on

THE AUTHOR OF "VIVIAN GREY."

From a Sketch by the late D. MACLISE, R. A.

1830.

the left it is parted and put away with a girlish carefulness. The coat is the coat of any ordinary civilian of the times, but not the waistcoat—a marvellous vest, in truth, gleaming in the wax-lights with its splendid embroidery of gorgeous gold flowers. Add to these, patent-leather pumps, a white stick with a black cord and tassel, and a mysterious complication of gold chains in the region of his neck and pockets—and you have a faithful picture of Disraeli the younger, author of "Vivian Grey" and "Contarini Fleming, or the Psychological Romance."

We have headed this article "A Contrast," and the title is the more closely enforced by the two illustrations which accompany it. The truth is, that Mr. Disraeli's entire career is one continued series of contrasts. We are now only glancing at those which, by virtue of

their historical position, are the most conspicuous and strongly defined. We are looking at the first and latest scenes in Mr. Disraeli's public and political life. The right honorable senator in his brougham in Bond Street may be the living antithesis of the curled young exquisite in Lady Blessington's *salon*; but the former is not the less the natural development of the latter, for all that. In the realities of Mr. Disraeli's manhood the ideals of his youth are accomplished. When "Vivian Grey" and "Contarini Fleming" were written, their brilliant young author neglected to take heedful note of the inevitable interval between ambition and achievement. The dreams of power and influence which are shadowed forth in the psychological romance have taken form and substance, as consummated truths with the author of "Lothair." The contrast, such as it is, is the contrast between the vision of aspiration and the fruit of action: and the great statesman is the logical outcome of the romantic youth. The wildest of Mr. Disraeli's youthful romances have been but the spiritualized exaggerations of actual life. "Contarini Fleming" is sonorously pronounced by its author to be a "history of the formation and the development of the poetic character." As a matter of fact, the pretensions are not justified by the book. "Contarini Fleming" is the autobiography of a youth who abandons the impalpable day-dreams of a visionary for the tangible gratifications of political power. He is a great man, Mr. Disraeli has told us in "Coningsby," who is able to sway his fellow-men, and mould them to his sovereign will. The key-note of all Mr. Disraeli's novels, of the careers of all his heroes, is also the key-note of Mr. Disraeli's life—the acquisition of power

and the possession of influence. "The moment that he entered society, his thoughtful face would break into a fascinating smile, and he listened with interest to the tales of levity and joined with readiness in each frivolous pursuit. He was sumptuary in his habits, and was said to be even voluptuary. Perhaps he affected gallantry because he was deeply impressed with the influence of women both upon public and private opinion. With them he was a universal favorite; and, as you beheld him assenting with conviction to their gay or serious nonsense, and waving with studied grace his perfumed handkerchief in his delicately-white and jewelled hand, you might have supposed him for a moment a consummate lord-chamberlain—but only for a moment, for, had you caught his eye, you had withdrawn your gaze with precipitation and perhaps with awe. For the rest, he spoke all languages, never lost his self-

possession, and never displayed a spark of strong feeling." So writes Mr. Disraeli in the psychological romance, and the words are significant as showing us the ideal of the author.

A contrast there, indeed, is between the position of the writer of "Vivian Grey" and that of the writer of "Lothair;" but it is not a contrast of surprise. On the contrary, it would have been strange if the lad who wrote the former of these works had not in time emerged to the dignity which clothes the statesman who wrote the latter. The magnificently-arrayed young gentleman whom we have seen in Lady Blessington's *salon* gave us ample promise of performance which should bring any honors of public life within his grasp that he

might wish to achieve.

If Mr. Disraeli had been able or cared to divest himself of some attributes of clever impetuosity, and to employ more of cunning, his political success might have been accomplished long before it actually was. A contrast, these two sketches, certainly; but it is simply the contrast between youth and manhood, between anticipation and fulfilment: it is the contrast which every progression exhibits: it is not the contrast of negation. In support of our position, let us examine matters a little more closely; let us investigate, as minutely as possible, the relation in which Mr. Disraeli of "Vivian-Grey" notoriety stands to Mr. Disraeli of "Lothair" renown; what and how significant is the interval of space which separates the Disraeli the younger, of Lady Blessington's drawing-room in Sea-more Place, from the Disraeli of the brougham in Bond Street, the ex-premier, and the acknowledged head of the Conservative, or, as we would rather say, of the Tory, party. Stated briefly, of what must the contrast

between the Mr. Disraeli of "Vivian Grey" and of "Lothair" be considered symbolical? Of the antithesis which is offered by inexperience to experience, and by sound practical wisdom to fantastic exaggeration. Whether the impression made by Mr. Disraeli's "Vivian Greyisms" has acted unfavorably for him upon the public mind may be a moot point; but it is quite certain that this novel contains the first germs of Mr. Disraeli's future vigor and power. We are not going to examine the mechanism of this or any other of Mr. Disraeli's works; neither shall we open up the profitless question as to how far some of the fictions of this eminent writer may or may not be considered autobiographical. What we are here concerned with is the Right Honorable Benjamin Disraeli at two different stages of his career, with the interval of forty years between them. As to

THE AUTHOR OF "LOTHAIR."

By JOHN GILBERT.

1870.

how far the one picture may be said to contain the promise of the other, we have already expressed our opinion. In what essential respects, if any, does the latter portraiture resemble the earlier? What features have been wholly obliterated by the lapse of time? or, on the other hand, are there any which have been brought out into stronger relief?

Every great poet, it has been said, must partially create the taste by which he is enjoyed; and the remark is eminently true of Mr. Disraeli's popularity. Mr. Disraeli has created the taste for Disraelism. "Vivian Grey" was the intellectual relish which provoked the public appetite. Mr. Disraeli has achieved eminence, not in spite of the shock of surprise which that "novel by a boy" administered to the world, but in virtue of continuing the impression of that shock by pursuing the method of its production. The audacious originality, which characterized the youthful novelist characterizes equally the complete and maturer statesman. Nothing is more remarkable than the continuity of Mr. Disraeli's intellectual life and development. The expansion and the enforcement of his public views and political doctrines have been strictly logical processes. Were the dreams of his youth extravagant? But who shall say that they are not the realities of his manhood? As a political thinker, Mr. Disraeli has been both consistent and sincere. The fantastic theories and the wild dreams of "Vivian Grey," "Contarini Fleming," even of the "Revolutionary Epic," have been crystallized into the compact principles of the statesman's policy. They have not been abandoned. Here and there a semblance of absurdity has fallen away, and an excrescence of impossible exaggeration has been pruned off. The wild imagination of youth has been subdued by the tempering discipline of experience. Ends that, when enounced in their crude shape, were asserted by the world to have been impracticable, have been steadily followed out by the statesman, and many of them have been attained. The ambition has been accomplished: only its vaunting pride, which on Mr. Disraeli's first entrance into public life overlapped itself, and threatened to land its rider in a bottomless pit of bathos, has been abandoned. The author of "Vivian Grey" made the mistake of supposing that the same qualities which had gained him notoriety as a novelist would give him fame and influence as a senator. He discovered the mistake, and he rectified it. The world, like Nature, can only be subdued by obedience to its laws. Mr. Disraeli has been able to so conspicuous an extent to gratify his pet political instincts by moderating his impulses.

Once more we turn to the portraits, placed in immediate juxtaposition, with which we have accompanied this article, and once more we seek to identify the earlier with the later. We have said enough to render the process of identification easy. Vivian Grey breathes again in Lothair, though with a difference and—a contrast. But it is the contrast of development rather than of metamorphosis. Between a stripling who has just written an undeniably clever but in parts utterly preposterous novel, who has as yet barely got his foot upon the first step of the ladder of public power and political fame, and the statesman who has in his time reorganized a great political party, mastered all the difficulties of political life, familiarized himself with all the labors of administration, given titles and conferred dignities, made baronets, peers, dukes, bishops, and even selected the primate himself, occupied important places in three different ministries, and finally, by winning the premiership, acquired the highest post which can be conferred on an Englishman, himself no Englishman at all—between these two conceptions a great gulf is fixed. But it is a gulf whose bridgment the years that bring the philosophic mind, a resolute determination to succeed which exhibited itself from the very first, are quite enough to explain. There are two or three closing reflections which this contrast between the Mr. Disraeli of "Vivian Grey" and the Mr. Disraeli of "Lothair" may suggest, as well as facts of which it may serve to remind us. There is no word which has so often been applied to the illustrious subject of our remarks as "adventurer." From the language employed by a host of uninformed and ill-bred writers it might be supposed that Mr. Disraeli commenced life without any thing save his brains, without friends, without connection, without means, without rank; that he has had throughout to struggle with difficulties both social and financial, wellnigh overwhelming in their nature; that he has eaten the bread of poverty, and been the needy creature of his superiors. On these points let us endeavor to correct public opinion, and enlighten popular ignorance. Is it likely that a young gentleman who had the *entrées* of the best so-

ciety in London, who lounges, as we have seen him, in and out of Lady Blessington's drawing-room whenever he pleases, who has, while a mere youth, men such as D'Orsay for his intimates, whose father can introduce him to the most considerable people in the kingdom, and who does introduce him—is it likely that this young man should be either impecunious or friendless? On the contrary, from the very first, Disraeli the younger was the favorite of Fortune. His father was well off; his son was always more than liberally allowed. Isaac Disraeli's house was frequented by the most eminent people of the day, and by visitors of the very highest rank. Where Disraeli the elder went, there went also Disraeli the son. He was exceedingly popular in his manner; his society was universally sought after, and it has only been his dogged determination of purpose which has enabled him to devote so much of his time to the laborious and exhausting pursuits of his career. In a man so circumstanced by nature and by fortune, where can we find the marks of an adventurer? Fame, notoriety—these were the two objects which Mr. Disraeli has striven so hard, and with success so magnificent, to gratify. The example is one which may be emulated by many another young man; but it is quite impossible that it should be emulated by any one who can start from a more conspicuous vantage-ground.

If we look at the nobler qualities of human nature, we shall fail to prove in respect of these any contrast between the author of "Vivian Grey" and "Lothair." Mr. Disraeli's writings have always been pure and elevating in tone. The characters which he has selected for eulogy, or the models which he has held up for imitation, have all been of an ennobling kind. The atmosphere into which he introduces us is healthy and sweet. His husbands are honest; his wives are true; his maidens are pure; and his lads are ingenuous. He has never written a word which a father would not read to his daughter, or a lover to his betrothed. And, in "Vivian Grey" and "Lothair" alike, there is the same chivalry of sentiment, the same generosity of soul, the same loyalty to the cause of friendship. There is nothing more interesting in Mr. Disraeli's history than his devotion to and his championship of those whose friendship he has made. In his biography of Lord George Bentinck, professedly a panegyric as that biography is, there is not a word which savors of fulsome insincerity.

OUR NATIVE ORCHIDS.

WHEN visiting a conservatory of choice exotics, we are usually most fascinated by the singularly beautiful forms and colors of the orchids. Many of them so closely resemble the shape of insects and imitate their color so exactly, that it is difficult to realize that they pertain to the vegetable kingdom.

Most of the tropical members of this splendid order love to perch themselves airily upon the branches of trees, and their position thus aids in deceiving the observer as to their actual nature. He fancies that some gorgeous insect has but alighted for a moment to rest its party-colored wings, and expects, at the next instant, to see it flit to the nearest flower.

We would naturally suppose, from their favorite position, that they were parasites; but such is not the case. The boughs of the trees and the nooks of rocks are but their resting-places; the air itself is their sustenance. Their delicate beauty disdains to be nourished by the earth which supports the neighboring plants. Nothing but the pure breath of heaven can be moulded into forms of such ethereal loveliness.

So perfect, oftentimes, is the resemblance to the lepidoptera, that insects themselves are said to be deceived and enticed toward their gaudy petals. This apparently trivial fact assumes a deep significance in view of the discovery of Darwin and others, who have proved, by careful observation, that most of the orchidaceæ are unable to produce seed except through the agency of insects, who, in their search for nectar, carry the fertilizing pollen from one flower to another, adhering to some portion of their bodies. The organs of the plant and of the insect are evidently planned to assist cross-fertilization. It is asserted that some of the orchids would perish from the earth, if their living attendants were destroyed. So instructive a study is the reciprocal relation between these two kingdoms of Nature as here indicated, that most botanists of our time have engaged in it with

enthusiasm. None can do so without admiring the patience, ingenuity, and perseverance with which Darwin has labored, or the clearness with which he has stated his results.

Examination proves the same relationship to the insect-world to exist in a vast number of plants belonging to other orders. Our own mountain-laurel, and the *houstonia* which whitens the June meadows, are found to be thus dependent upon insects. Other curious affinities between animal and vegetable life have been pointed out by Wallace, whose essays upon "Mimicry and Protective Resemblances" are among the most interesting in his published works.

The study of the orchids will prove very interesting to all whose attention is attracted to them. Generous though our friends may be, however, they will scarcely care to furnish, from their conservatories, their costly specimens for analysis. But the tropics do not alone yield this fantastic family. In summer its members rejoice all about us; but in our cold climate we must not seek them in the tree-tops, but mostly in swamps or damp woods. May brings us the lady's-slipper, and June adds the exquisite *arethusa*, the fragrant *pogonia*, easily mistaken for the last, and the *callopogon* with its beauteous beard. To describe either individually would be but to reflect upon the equal elegance of the others. But of one, the small, fringed orchis, we cannot hesitate to speak. When, in early June, we discover it upon the river-bank, but one of its ciliated blossoms perhaps may be expanded; but, as we bid it welcome to the house, it holds out flower after flower in gratitude.

There is a larger and even more showy fringed orchis, of similar appearance. It is not so frequently met with here, but is of common occurrence in the woods of Maine and New Brunswick, where, too, is found the rare calypso, a dainty slipper of purple, pink, and yellow, which "Nature's own sweet and cunning hand" has so tastily adorned that even Titania would hesitate to profane it by her fairy touch. In July it may be our rare good fortune to meet with the white-fringed orchis, the most spiritual flower of the forest. It may be regarded as some sweet soul, who, in this form, loves still to linger upon earth. We hesitate to breathe, lest we waft it away.

Many other orchids might be mentioned—such as the showy orchis, whose odor recalls some scarcely-defined impression of the past; the goodyera, with its strangely-mottled leaves; the graceful "maiden's-tresses," and the coral-root. But our desire is not to chronicle a list of names, but to introduce these pretty flowers to our readers in the most pleasing guise. We have already said enough to call attention to these gentle teachers of beauty and all-wise design.

JAPANESE FÊTES.

IN the opinion of Kaemper, the ancient Japanese chose days for their principal annual *fêtes* which were supposed to be the most unfortunate, their object being, not only to divert the gods, but also to counteract all evil influences, by the united prayers and wishes of the people. The principal fêtes—five in number—are connected by a series of solemnities of an inferior order, specially characterized by manifestations of public joy. Of these there are thirty-eight, occurring on the first, fifteenth, and twentieth of each month, and at the summer and winter solstice.

The *reïbis*, as these minor fêtes are called, are, however, not days devoted exclusively to recreation. All the citizens don their best attire, it is true, but only to offer up their morning devotions in the temple of their choice, and to make a round of visits among relations, friends, or civil or military dignitaries. The remainder of the day is spent in playing their respective vocations, in the family circle, or in the public gardens.

Such are the general characteristics of the monthly fêtes. That which distinguishes the one from the other is due to certain peculiarities of climate, or to the various natural products of the seasons. Thus, a dish of boiled beans (*Phaseolus radiatus*) invariably forms a part of the repasts of the first month, and a dish of fresh vegetables of those of the second. The boys take an active part in the merry-makings that accompany the agricultural labor of the spring. They are allowed to carry a holy-water sprinkler, and to cover their faces with a mask representing the head of a fox, in memory of the God of Rice, who brought this precious cereal from China to Japan, mounted on a horse with the head of a fox.

The following month, the young girls, in their turn, leading their younger brothers and sisters, repair in crowds to the banks of the Semida-gawa. They are not masked, but are painted, and powdered, and tricked out with gewgaws and bawbles in their hair and girdles. Thus adorned, they go gathering bouquets of flowers, vying, in a manner, with the luxuriant verdure of spring by the brilliant colors of the infantine costumes.

One of the principal annual fêtes—that of the seventh day of the seventh month—is called the Fête of the Lamps, or the Lanterns. At Jeddo, little girls promenade the streets in crowds, singing at the top of their voices, and carrying paper lanterns. In some of the southern cities, the inhabitants visit the cemeteries, and pass the night among the tombs.

The thirteenth, fourteenth, and fifteenth, are the days on which the people visit the temples to pray for the dead and burn tapers for them. The fifteenth is the day on which all accounts are adjusted for the first half of the year. The performance of this duty is followed by a general jubilee, embracing every variety of amusement, in which masquerades, accompanied with the national dances, are one of the most popular. All the masks have their signification, their traditional character. There are the placid faces of noblemen and the ladies of the *dairi*; then the savage features of the heroes of their civil wars. There are fantastic masks with movable jaws, in imitation of those worn by the actors of the mikado. Others represent the grotesque and divine Tengau (the good), chub-faced Okame, or the unfortunate Hiyotoko, the ideal of ugliness. Among the latter are representations of every known variety of the race of demons—those with one eye, with two eyes, and one, two, and sometimes three horns, from the smallest devil to the most gigantic, including the odious Hanggia, the female demon. Finally, there is another class made to represent Master Kitsne, the fox, or Sarau, the ape, or the lion of Corea or of Kappa.

As for dances, there is no end to them. The rice-dance alone has about thirty figures. It is executed by men only, wearing for their entire costume a girdle of rice-straw, a hat of the same material, pulled down over the eyes, and a short mantle, falling over the shoulders, with sleeves that resemble the wings of a butterfly.

Among the fêtes of the fourth month is that of the baptism of Buddha, which takes place on the eighth day. On this occasion the god is represented as he is at his birth, standing, pointing to heaven with one hand, and to earth with the other. Not only do the pious sprinkle holy tea over the bronze image of the sacred infant, exposed over the baptismal font of the temples of his religion, but the *cashéris* of the *bonzeries* run through the city, carrying his statuette, secured to the centre of a tub, in order that the same ceremony may be repeated from house to house.

The fêtes of the sixth month have reference to the harvest of the cereals—rice, wheat, millet, or paddy, etc. The priests bless little square pieces of white paper, fixed to wooden pegs a few inches in length, which cultivators of the soil buy and place at the corners of their fields, believing that these mystic amulets are indispensable to give fecundity to the soil.

This season of the year is for the citizen of Jeddo a time of general public merry-makings, which, for the most part, take place on the banks of the Semida-gawa or in the gardens of Odgi. These amusements are continued until the last day of the month, a day of universal expiation and purification.

The God of the Water, an ancient divinity, is fêted, from one end of the empire to the other, during the entire seventh month, which comprises nearly all the rainy season. Tall stalks of bamboo, ornamented with their upper branches, little glass bells, and bands of holy paper, are raised near the springs, wells, and canals of irrigation. On these stalks, every morning and evening, at the sound of the gongs of the *bonzeries*, they raise, here and there, banners bearing the inscription, "Respect and homage to the God of Water!" In the habitations of the country people, the members of the family bring to the altar raised in honor of Kami offerings of rice, fish, and small coin.

The eighth month opens with a tedious exchange of civilities between employers and employés, subalterns and their superiors, etc. The fifteenth of the month is dedicated to the god of the moon. The Japanese say that it is then our satellite shines most brilliantly. The rivers and canals are covered with gondolas, whose occupants find their chief pleasure in contemplating the full moon.

JAPANESE FESTIVAL OF THE BANNERS.

JAPANESE RICE DANCE.

The tenth month is devoted to Yebis, who is at once the god of the fisheries, and one of the principal patrons of commerce. The merchants evince their piety by making presents, among which figure prominently millet-cakes, and a large red fish, called *taï*, much esteemed in Japanese festivals for the delicacy of its flesh and its beautiful appearance.

The ladies of the city are not less diligent in performing the duties their social position imposes upon them. Like good neighbors, they make one another visits, but do not allow the interchange of civilities to prevent their burning a few tapers before the image of Yebis, for the prosperity of their husbands' commercial enterprises. At an early hour in the morning they may be seen wending their way in groups to this or that *bonzery*, which has reserved in its sanctuary an altar, modest though it may be, to the god that, more than any other, has the privilege of receiving the homages of the citizens. They go in the habit of a pilgrim, the head bonneted with a cotton handkerchief of marvellous whiteness, artistically arranged over their luxuriant tresses.

Toward the middle of the month, every one is morally bound to observe, and to communicate to his neighbor, the fact that the leaves of the palmated maple begin to change their color.

At the beginning of the eleventh month, the maple is in all the magnificence of its autumn robes. Crowds of the curious unite to admire it in the gardens of the *bonzeries* and the tea-houses.

The winter solstice is a time of general felicitations; it is the fête of the married women. No affair, however important, no commercial negotiation, or any business matter whatever, is allowed to keep the husband from the conjugal roof on this occasion. They return to their homes from every direction. In the evening the city is illuminated, and in every house may be heard accents of general rejoicing.

The fifteenth of the month is called the "Crossing of the River," on account of the religious and domestic solemnities celebrated on that day, that symbolize the flight of Time and the transition to the new year.

Finally, with the twelfth month, the Japanese enter into such a grand bustle of affairs, settlements, liquidations, moving, repairing of furniture, and such a succession of ceremonies, formalities, fêtes, and merry-makings, that the four or five weeks of the end of January and the beginning of February offer sufficient material for a volume.

MATRIMONIAL SUPERSTITIONS.

IN olden days, June was held the most propitious month in the twelve for marriage, a happy result being rendered doubly certain if the ceremony was timed so as to take place at the full moon, or when the sun and moon were in conjunction. But in these later days May is a favorite marrying month in England, so that one matrimonial superstition has gone the way all such fancies are doomed, sooner or later, to go; for May used to be as much avoided by persons about to marry as June was favored, that merry month being supposed to be specially under the influence of malignant spirits delighting in domestic discord. "The girls are all stark naught that wed in May," is the verdict of one old saw; another declares—

"From the marriages in May
All the bairns die and decay;"

a third pronounces, "Who marries between the sickle and the scythe will never thrive;" while a poet, complimenting the month at the expense of what should be the ruling passion in marriage-minded folks, sings:

"May never was the month of Love,
For May is full of flowers;
But rather April, wet but kind,
For Love is full of showers!"

But if old sayings ruled the world, there would be no marrying at all, for a very old one avers that no man enters the holy state without repenting his rashness before the year is out; unless, indeed, everybody determined, like the old Norfolk farmer, to cheat the adage by wedding on the 31st of December.

In times gone by, candidates for connubiality were obliged to study times and seasons. The Church would not allow them to marry just when they felt inclined. "Marriage," says the register of Norton, "comes in on the 13th of January, and at Septuagesima Sunday it is out again until Low Sunday, at which time it comes in again, and goes not out till Rogation Sunday; thence it is forbidden until Trinity

Sunday; from thence it is unforbidden till Advent Sunday, and comes not in again until the 13th of January." That those concerned might better remember the rules, somebody put them into rhyme, running thus:

"Advent marriage doth deny,
But Hilary gives thee liberty;
Septuagesima says thee nay;
Eight days from Easter says you may;
Rogation bids thee to contain,
But Trinity sets thee free again."

It was considered improper to marry upon Innocents' Day, because it commemorated the slaughter of the children by Herod; and it was equally wrong to wed upon St. Joseph's Day. In fact, the whole season of Lent was declared sacred from the intrusion of Hymen's devotees. "Marry in Lent, and you'll repent!" and there are good people among us still who, if they do not believe that bit of proverbial wisdom to be prophetic, undoubtedly think Lenten wedders deserve to find it so.

We may possibly be doing a service to some of our readers by informing them (on the authority of a manuscript of the fifteenth century, quoted in "The Book of Days") that there are just thirty-two days in the year upon which it is unadvisable to go into join-hand—namely, seven in January; three each in February, March, May, and December; two each in April, June, July, August, September, and November; and one in October; so that January is the worst, and October the best month for committing matrimony; the actual unlucky days being these: January 1st, 2d, 4th, 5th, 7th, 10th, 15th; February 6th, 7th, 18th; March 1st, 6th, 8th; April 6th, 11th; May 5th, 6th, 7th; June 7th, 15th; July 5th, 19th; August 15th, 19th; September 6th, 7th; October 6th; November 15th, 16th; and December 15th, 16th, 17th. As to which is the best day of the week, why—

"Monday for wealth;
Tuesday for health;
Wednesday the best day of all;
Thursday for crosses;
Friday for losses;
Saturday no luck at all."

Friday is generally considered an unlucky day in England; but in France the country lasses look upon the first Friday in the month as peculiarly favorable, if not for the actual ceremony, at least for determining who will be one of the principal actors in it. Before getting into bed, the curious damsel raises one leg, and plants it against the foot of the bed, hoping by this simple action to induce the patron of bachelors, good St. Nicholas, to show her in her sleep the counterfeit presentment of her destined husband.

Young ladies should abstain from listening to any one whose surname begins with the same letter as their own:

"To change the name and not the letter,
Is a change for the worse and not for the better;"

and they would do well to take the precaution of placing their initials in conjunction with those of any admirer they incline to favor, and ask, like Malvolio: "What should that alphabetical position portend?" for if, of the united initials, any word can be formed, they may be certain the owners of them will never be happy together.

It is an unhappy omen for a wedding to be put off when the day has once been fixed. In Sweden, it is believed much harm will ensue if a bridegroom stands at the junction of cross-roads, or beside a closed gate, upon his wedding morn. It is a bad sign if the bride fails to shed tears on the happy day, or if she indulges herself by taking a last admiring glance at the looking-glass after her toilet is completed; but she may gratify her vanity without danger if she leaves one hand ungloved until beyond temptation. To meet a priest, dog, cat, lizard, or serpent, on the way to church—to look back, or to mount many steps before gaining the church-door, are alike ominous of future unhappiness; and, according to English north-country notions, it is courting misfortune to marry in green, or while there is an open grave in the church-yard; or to go in at one door and out at another. The weather, too, has a good or bad influence upon affairs; happy is the bride the sun shines on, and, of course, the converse is equally true. Evil portents may scare the happy pair even after the knot has been tied. "When the bridesmaids undress the bride," says Misson, describing the marriage merriments of England, "they must throw away and lose all the pins. Woe to the bride if a single one be left about her; nothing will go right! Woe also to the bridesmaids if they keep one of them, for they will not be married before

Whitsuntide, or till the Easter following, at soonest!" Where the Scottish custom is followed of the newly-wedded couple being welcomed home by the husband's mother meeting them at the door, and breaking a currant bun over the head of the bride before her foot crosses the threshold, it is thought a very bad omen if the bun be, by any mistake, broken over any head but that to which the honor is due. If a bridal party venture off dry land, they must go up-stream; should they be foolhardy enough to go down the water, either the bride, the bridegroom, or one of the bridesmaids, will infallibly feed the fishes. Spite of the faith in there being luck in odd numbers, it is a belief, in the north of England, that one of the wedding guests will die within a year, unless the party counts even. Another comical idea is, that whichever of the two, bride or bridegroom, goes to sleep first upon the wedding night, that one will be the first to succumb to death.

The only omens we know of tending to encourage adventurers in the great lottery of life, are the meeting of a wolf, spider, or toad, on the way to church, and a cat sneezing within the bride's hearing the day before the wedding; but, fortunately, there are many ways of insuring happy fortune. In the Highlands of Scotland, the malicious influence of warlocks and witches used to be kept at bay by preventing any unlucky dog passing between the couple on their road to church, and by taking care the bridegroom's left shoe bore no latchet and buckle. By using gray horses in the bridal carriage, the same good purpose is effected. Swedish bridegrooms sew garlic, chives, and rosemary in their wedding garments, to frustrate the evil designs of the trolls and sprites; and the attendants on the lady carry bouquets of the same herbs in their hands; while the bride herself fills her pockets with bread, which she dispenses to any poor wayfarers she espies as she goes to church, every piece she gets rid of averting a misfortune; the gift, however, is of no use to the receiver, since, if he eats it, he thereby brings the misfortune upon his own head. Manxmen find a pocketful of salt equally efficacious. The brides of Elba go bareheaded to church; and, while the ceremony is proceeding, the happy man puts his knee upon the bride's dress, preventing evil spirits putting in their undesired presence, and whispering words in the bride's ear which would render the priest's prayer for fertility utterly inoperative. Women married at Jarrow need no prayers to make them joyful mothers of many children, that end being attained by sitting themselves down in the chair of the Venerable Bede as soon as the parson has done his part. In some parts of England, good luck is supposed to be insured by a friend making a hen cackle in the house of the wedded pair. In China they have a curious ceremony, believed to be a never-failing means of making a marriage turn out well for the lady. When she has taken her place in the sedan in which she is to be carried to her future home, her father and mother, or other near relatives, hold a bedquilt up by its four corners in front of the bridal chair. Into this, one of the bride's female cronies tosses, one by one, four bread-cakes (the gift of the bridegroom's family), sending them up high in air; while the lady most concerned in the matter repeats without ceasing certain sentences invoking happiness upon herself and spouse, to which the company assembled respond with the Chinese equivalent for "Amen."

The Cornish well of St. Keyne possesses

'The quality—that man and wife,
Whose chance or choice attains,
First of this sacred stream to drink,
Thereby the mastery gains;'

but, in Sweden, the damsel ambitious of ruling her lord as well as his house, can attain her wish by merely contriving to see him on the bridal morning before he sees her; or, failing in this, she has yet another chance at the last moment, by putting her right foot before that of the man when they approach the altar.

The lately-revived custom of throwing shoes after a newly-wedded couple for luck, is a very old one. In the Isle of Man, the shoe is thrown after bride and bridegroom as they leave their respective abodes; but the ceremony is generally performed elsewhere, upon the departure of the hero and heroine of the day for the honeymoon trip. In some parts of Kent, the shoe-throwing does not take place until after they have gone; when the single ladies range themselves in one line, and the bachelors range themselves in another. An old shoe is then thrown as far as the thrower's strength permits, and the ladies race after it, the winner being rewarded by the assurance that she will be married before any of her rivals. She then throws the

shoe at the gentlemen, the one she hits laying the same pleasing unction to his heart. Something like this is practised too in Yorkshire and Scotland. In Germany it used to be the rule for the bride, as she was being conducted to her chamber, to take off her shoe and throw it among the guests, who battled for its possession, the successful he or she being held destined to be speedily married and settled. In England, the bride, from between the sheets, threw her left stocking over the shoulder of one of the company, the person upon whom it fell being marked out as the next individual to be married. In some places, the threshold is kept warm for another bride by pouring a kettleful of hot water down the door-step as soon as the bride and bridegroom have taken their departure; the fancy being, that before the water dries up, another match will be made up, or "flow on," and that it will not be very long before another wedded couple passes over the same ground. In Prussia, the method adopted of invoking blessings on a newly-married pair used to be the more expensive one of smashing crockery against the door of the house in which they were domiciled.

The breaking of a wedding-ring is an omen that its wearer will soon be a widow. A correspondent of *Notes and Queries* found this fancy current in Essex a few years ago. A man had been murdered in that county, and his widow said: "I thought I should soon lose him, for I broke my wedding-ring the other day; and my sister too lost her husband after breaking her ring. It is a sure sign!" Such superstitious notions are far more prevalent than one would suppose, and the school-master will have to work hard and long before they are entirely eradicated in England.

AN HOUR WITH BISHOP DUPANLOUP.

FROM THE GERMAN.

ON the morning of December 5, 1870, the Prussian flag waved from the Cathedral of Orleans, and at noon we drove into the "City of the Maid." I entered it with the firm resolve to institute a search for the whereabouts of a highly-respected colleague, Dr. Kayssler, general correspondent of the Berlin papers at the grand headquarters. This gentleman had arrived in Orleans on the day before General von der Tann's evacuation of the city, and, remaining behind, had been made a prisoner of war and had disappeared. Orders had come from Versailles to search for him in Orleans. Unfortunately, the inquiries set on foot by the Prussian commandant had but a poor result: from his captivity in Orleans, Kayssler had written one letter to his friend, Dr. Alexis Schmidt, and since then every trace of him was lost. Among the persons who took an interest in the fate of the German journalist, Bishop Dupanloup was also mentioned to me. To him I determined to address myself, with a view to learn more of the missing man; but, certain circumstances preventing, I could not carry my purpose into effect during our first stay at Orleans, from the 5th to the 12th of December, and did not, therefore, write to the bishop respecting the matter until we had returned from our week's jaunt to the south, and the French Army of the Loire had changed its northerly direction toward Paris for a westerly one. On the following day I received an invitation to visit the bishop, if convenient, between the hours of five and seven.

The bishop's residence lies right behind the cathedral. Passing through a stately gate-way you enter a large court, the entire depth of which is taken up by the bishop's mansion. Over the gate-way shine the arms of the bishopric of Orleans, and under them hung a French flag, another with the emblem of the Geneva Convention, and in the centre a large Prussian banner, indicating the presence of French and Prussian wounded in the mansion, on which account, a guard being also posted at the gate-way, this had occasioned the report that the bishop was detained a prisoner in his dwelling by the Prussians. To the right of the gate-way is the dwelling of the steward. I rang the bell and inquired the way to the apartments of monseigneur. The steward seemed to have been apprised of my visit, and prepared to conduct me. As I was about advancing toward the entrance to the palatial main building, which differs in nothing from all structures of the kind, the steward pointed to the left, and excused himself for not conducting me up the great staircase and through the reception-rooms. These, he said, were fitted up for the wounded, and he should have to show me the way to monseigneur's apartments by a side entrance. We crossed several small yards, in which Prussian soldiers were split-

ting wood, entered a wing of the building by a plain-looking door, and ascended a tolerably broad staircase, at the upper end of which my conductor opened a long, narrow antechamber, bidding me enter. The apartment into which I was shown was furnished in rather a plain manner; on either side stood a row of chairs, on the walls hung water-color paintings and framed drawings, probably the productions of noble and pious female *dilettanti* and penitents of the bishop, who is the friend, adviser, and spiritual father of the French legitimist nobility. From all parts of the country, and not even of France alone but also of England, come the fair and noble penitents to leave with him their scruples of conscience; in Orleans there is a colony of Catholic English of high station, and very often, too, the bishop is summoned to Paris to perform spiritual offices.

While looking at these pictures, I heard the steward speaking in a low tone to some one on the outside of the door; but I could distinguish only the words "*Le Prussien!*" spoken in a tone of mingled anxiety and surprise. The long Prussian military cloak and the Prussian infantry-cap, which I wear during the winter campaign, must have caused the speaker to recognize me. Who knows for what an important personage the old servant, alarmed for his spiritual master, may have taken me! The next moment a young abbé entered, glided noiselessly along the carpeted floor, and, opening an apartment lying to the left of the antechamber, requested me to enter, with the remark that monseigneur would presently make his appearance.

Apparently this was the bishop's study. It was a large, square room, very high, and containing two windows, which fronted upon the court. The walls were covered with dark hangings; the wall opposite to the windows was occupied, from the floor to the ceiling, by a library. On the wall to the left of the windows hung framed engravings; the middle of the opposite one was occupied by the large marble mantel, upon whose shelf stood a clock in the style of Louis XVI.; the mirror's place was supplied by a large crucifix; another hung on the wall between the two windows, and under this was a *prie-dieu*. To the right of the window stood a large writing-desk, with a small arm-chair, covered with gray leather; at this the bishop appeared to be working, while at another, placed at a little distance from the book-shelves, sat the secretaries, of whom he has no less than six. The bishop's correspondence extends, as was told me, over the whole Catholic world, which means more than the whole civilized world. His activity is unceasing—very frequently he dictates to several secretaries at once; it is his custom to rise at four o'clock in the morning, and to retire to bed at nine in the evening, from which latter habit nothing can divert him, neither company at another nor at his own house. He visits only the prefect and the first president of the Court of Cassation; on Sundays he receives at his own mansion the society of the city. In order to enjoy his company for a longer time (it being known that he retires the moment the clock strikes nine), they assemble as early as seven, and nowhere in Orleans are more people and better society seen than at monseigneur's receptions. But the people of Orleans hold their bishop in high esteem, and, indeed, the influence exerted by him upon the moral spirit of the population is unmistakable. An almost German modesty and severity reigns in the families there; and nowhere in France have Parisian life and manners excited greater disgust than in Orleans.

"Your lines meet my wish to learn something more of Dr. Kayssler, and I bid you welcome, sir."

It was a soft, somewhat high, but musical voice which I heard; a tall and venerable old man stood before me, clad in a violet-colored *soutane*, with a cape of the same color reaching to his waist. From beneath the little black cap covering his head fell his snow-white hair; his face had much color, and the lower part of it, the round chin, the pleasantly-formed mouth, contrasted remarkably with the sharply-cut nose and the vivacious, fiery eyes. Around his neck he wore the black, white-bordered band peculiar to the Gallican clergy, upon his breast the bishop's golden cross—his whole appearance, from the crown of his head to the soles of his feet, the type of a prince of the Church.

With a graceful gesture he bade me take a seat in one of the *fauteuils* before the mantel. I did so; he seated himself opposite to me, and then requested me to place my feet upon the fender. I begged his pardon, if in the course of our interview I should be found not to speak the French language with that elegance which such a mind as his was justified in demanding.

"A person who can write French as well as you have done in your note, and who can beg pardon so cleverly, can speak French, too."

"The latter is even easier than writing, monseigneur. In the composition of my note to monseigneur, I was assisted by the landlord with whom I am quartered."

The bishop laughed. He now proceeded to tell me all he knew regarding Dr. Kayssler, speaking of him as a gentleman whose acquaintance he had made with the liveliest pleasure, and for whose abilities and character he entertained the highest respect. The doctor, he said, had been betrayed into the hands of the French by his landlady on the day after Von der Tann's departure, and he had immediately done all in his power to secure his release, writing to the government at Tours for that purpose. Dupanloup succeeded in obtaining a letter of safe-conduct for another prisoner, who took Dr. Kayssler under his protection. Since their departure from Orleans, he had heard nothing of the doctor. He again offered to do all for the prisoner that his position and influence rendered possible; yes, he would even write to Gambetta. Upon my expressing a belief that the doctor was confined at Hyères, the bishop instantly declared his readiness to write to the parish priest of Hyères, to a female acquaintance of his at Pau, and also to Père Gentry, and desire them to make inquiries. To the Bishop of Tours he would also write. As there was no safe way of transmitting the letters, however, I said that I would take care they reached their destination if he would have the kindness to send them to me in unsealed envelopes, as the law directed. By so doing, I added, he would earn the gratitude of all my colleagues of the press for his extraordinary kindness.

"Very well," he said, "I will send you the letters this very evening. Oh, how difficult and complicated all this is now! Into what a terrible state have we fallen! What will become of poor France?"

"The country will certainly not remain a republic," I observed, and availed myself of the opportunity to give him a brief description of the feeling I had met, during our week's trip, in the villages and towns south of Orleans—a state of feeling any thing but friendly to the republic, and decidedly hostile to M. Gambetta. It were an offence against what is due to so eminent a public personage, did I repeat here his views and expressions; the kind reader must content himself with being informed that his manner became every moment more animated and excited, one thought pressed upon the other, deduction chased deduction, philosophical propositions and historical facts crowded one another, but all had been grasped with an original mind; all was reproduced in the most perfect form—mouth, eyes, and hands, speaking. In spite of his sixty-eight years, he grew young again, and his speech took such enthusiastic flights that I was admiringly silent; and here, in a simple conversation by the fireplace, I comprehended the immense power exerted by this man as a pulpit-orator upon the people, and why they flocked to his sermons as well now in Orleans as also formerly when he was only *curé* of St. Roche in Paris. It is not the religious element alone which produces this overmastering effect, but its being blended with the national. Dupanloup, together with his three great friends Montalembert, Lammenais, and Lacordaire, belongs to a shade of the Roman Catholic Church professing a liberal Catholicism, or, more properly expressed, a national one, and whose first tenet is, "*First a Frenchman, and then a priest!*"

There is a great national mobility and sprightliness in this man, an incessant working of the thoughts, and especially of the imagination. On Christmas-day, I saw him in the repurified cathedral, sitting upon his throne in his golden sacerdotal robes, and surrounded by the splendor and nimbus of the Catholic ritual. This being compelled to sit quietly in one place during the monotonous vespers did not seem at all to his taste; he was constantly moving about on his seat, tugging at his robes, as if they were too heavy and uncomfortable for him, and he even looked about several times. To all appearance, his thoughts were anywhere but with the vespers at the Cathedral of Orleans, for which I am very far from blaming him. These songs are too cold and unimpressive—a movement of the lungs, but not a quickening of the religious spirit. The impression was quite a different one when, attended by the clergy, the mitred bishop mounted with his staff the stairs leading to the high altar and greeted the faithful. With large, sure steps he led the way, and the impression he made upon you was that of a prince of the Church wearing an armor beneath his priestly robes. It is not to be denied that there is something militant about the bishop, which, too, is expressed in his letter to the lower clergy on the occasion of the festival of Saint-Aignan. Aignan, it will be remembered, was the second bishop of Orleans, the same who, on the approach of the Huns, secured the aid of Aëtius, and, by his eloquence and example,

inspired the already despondent inhabitants of Orleans with fresh courage and redoubled power of resistance. On reading this letter (which is in reality addressed to the whole of France), we get the picture of a priest marching fanatically before his warriors, cross in hand; we feel how the writer, driven by his glowing, patriotic heart and bold imagination, identifies himself with the second Bishop of Orleans, the Army of the Loire with the rescuing hosts of Aëtius, and the commander of the Second German army with—Attila!

"I know," he said, "that the Prussians have frequently reproached me with this letter. But have I insulted the army, the Prussian nation—can any invective be shown?"

"No, monseigneur, there cannot; but the whole letter is a declaration against us."

"Great offence has been taken at one expression of which I made use, namely, 'wild hordes.'"

"Not that I know, and pardon me, monseigneur, for doubting it, too. People take offence only when they are hurt."

"If you have read the letter, you will, indeed, find such an expression; but it is not I who use it. It occurs in a quotation that I employed from Gregory of Tours, the father of our national history, as you know."

To which I might have replied that this method of argumentation is a very hazardous one, since what else is the object of a quotation but to substitute another's words, another's opinion, for one's own, with a view to giving the latter greater strength? Quotations are words which we appropriate and by which we are represented. But I did not say this. The bishop was friendly and accommodating toward me, and it is not the usual way to return discourtesy for kindness. If in the course of our conversation I had answered several arguments, it was done to maintain our national stand-point, and this caused me, also, to remark to the bishop that the danger in respect to his letter lay not in the opposition it displayed toward us, but in his having inflamed the hearts of his countrymen to resistance, and his having excited in them hopes incapable of fulfilment.

"That was my duty as a Frenchman. Oh, I cursed the war, but when the people rose after the defeat of the imperial army, could I have done otherwise than strengthen their spirits with hope? Why should I not give expression to the belief that Saint-Aignan, that the Virgin, could assist and lead us to victory?"

"I made mention of her in my first letter."

"I have read it, monseigneur, and also the words which monseigneur has given his people for a consolation: 'I do not believe in force, I believe in justice only.' But pardon me, monseigneur, the queen suffered through France, died through France; this sacred shade is our own; those words, too, are ours, and we cannot let them be snatched from us; for the memory of the queen is our vindication and our standard; justice is on our side in this war, and because it is, force is not, but strength. Monseigneur intimates in his first letter that it is military ambition which induced the king to continue the war. No, monseigneur, it is our nation that induced him, and the king and Count Bismarck know this very well, and also know that they can make no peace for Germany but one restoring to the latter Alsace and a part of Lorraine."

To this the bishop made no reply. Perhaps it showed little tact on my part to touch this sensitive spot in the heart of a Frenchman—but I had allowed myself to be carried away—his national animation had proved infectious. With all the art of a man who possesses in the highest degree the gift of speech and social discourse, he passed from this general discussion to persons, speaking in the most respectful terms of the king, and expressing the highest veneration for Queen Augusta.

"I waited upon the queen last year at Coblenz," said he, "and in dignity, grace, intellect, and sense of duty, saw a true queen. I regarded with particular interest her majesty's library, which the queen directed one of her ladies to show me. You Prussians are fortunate, you have a strong government—when shall we reach that point? Ever since 1789 we have not been able to free ourselves from revolutions, and these incessant shocks cause the want of social restraint from which France is suffering. Poor France! Peace—peace—peace! Why did they not accept the armistice at Versailles?"

"Your hopes, monseigneur, are turned to the Virgin: the female ideal to whom we raise our hearts and thoughts in this war is Queen Louise."

"Probably, monseigneur, because it offered the French greater advantages than it did us."

"That is your way of looking at it—Thiers had another; he is an old friend of mine, and visited me on his way from Tours to Versailles. He represented the matter differently to me. I believe that different conditions would have been made by you, could you have known that Paris possesses so great a supply of provisions. And yet it is my conviction that our present government, and above all Trochu, would be disposed to treat, if the sentiment of the country were known to them, especially that of the provinces devastated by the war. But who shall tell them of it? Count Moltke, it is true, tried something of the kind, but then he is on the hostile side; it would have to be some one who possesses the confidence of our country. Ah, this is mere wishing, and yet we all stand in such need of peace!"

This ended the audience; it was now six o'clock. With extraordinary amiability the bishop accompanied me to the farther door of the antechamber, and that very evening I received the promised letters.

MY HOUSE AT BIENVENUE.

IN my house at Bienvenue,
Pleasant passed the days—
So blissfully we scarcely knew
We walked such happy ways.

Ah! here Hope's golden seed was sown,
And blossomed with all grace;
The sun—he could not bear to frown
Upon the quiet place.

'Twas built so many years ago,
The house is old and quaint,
And yet about it spreads a glow
Like halo round a saint.

Above the casements roses weave
A net-work light and fair;
The open doors, from morn till eve,
Let in the scented air.

The sloping lawn, the shadowy grove,
Were grateful things to see;
And our two hearts, so full of love—
We could but happy be.

Those summer-eves, so soft and calm,
Reach far into the night,
And swathe us in sweet clover-balm
And gold-and-purple light.

We watch the dying of the day,
My head upon her lap—
So still, we hear, across the bay,
The far drum's muffled tap.

What heaven of comfort in the hands
She presses on my head!
I pass into the misty lands,
And dream that I am dead,

And that an angel watches me—
And feel that I am glad
Beside the shore where breaks no sea,
And souls are never sad.

HENRY GILMAN.

TABLE-TALK.

WE recollect reading, many years ago, a story, written by a lady of Philadelphia, the moral of which turned upon the New-York dining-rooms. According to the story, a cultivated and wealthy son of the Quaker City had fallen in love with and married a daughter of one of the Knickerbockers. The hero and heroine were young, were endowed with excellent qualities of heart and mind, were very fond of each other—and yet the demon of discord entered their household, and for a time threatened their permanent peace and welfare. The master of the house liked the Philadelphia fashion of a dining-room on the parlor floor; but the wife was so enamoured of the New-York method of using the basement floor for the purpose that she insisted upon converting their Philadelphia house into a New-York “high-stoop, basement-story” domicile. The master of the house objected. He did not like the half-lighted, gloomy, semi-cellar dining-room of the New-York pattern, and argued that the Philadelphia mode gave a more cheerful room. But the lady of the house was wedded to the ways of her fathers. She thought a basement dining-room more convenient than any other, and quite as pleasant. From this difference of opinion arose many bickerings, and finally a temporary estrangement. But these details we are not concerned to follow. The story is interesting to recall because it touches upon what is really a great defect in our New-York households. Whence arises the notion that any room in a house, provided it is conveniently near the kitchen, will do to eat in? Inasmuch as breakfasting and dining are the two occasions that specially assemble all the members of the household together, there is every reason in this fact alone that these reunions should be under cheerful and agreeable conditions. A breakfast ought to be something delightful. Through broad windows, the sun should enter, with all the pomp and splendor of his morning glory. The furniture of the room should be pleasing in form and color. In winter, a cheerful blaze in an open grate should give lustre and charm to the apartment. Bright breakfast-rooms promote cheerfulness in the social circle, stimulate talk, and thereby aid digestion, and are a very great means of bestowing comfort, increasing happiness, and benefiting health. But somehow the idea prevails, that breakfast and dining rooms must always be furnished and set forth in a gloomy fashion. We paint the wood-work in oak; we buy furniture of oak; we cover the walls in some sombre color; we take all the pains we can to render this apartment exceptionally dreary and repulsive. In New York we select a room half underground for the purpose; but everywhere there is a traditional idea that eating is an unpleasant necessity, that must be performed with some show of decency, it is true, but one that requires no particular attention as regards enlivening surroundings. Our family circles would gain in felicity no little if an entire change in the current notion on this subject should come about. The model dining-room should have a southerly or easterly

exposure; it should be furnished almost gayly, certainly brightly; it should have an air of complete refinement; and the table itself, in its tasteful articles and inviting arrangement, should contribute to that atmosphere of quiet joyousness which is so desirable, and which would go so far to render the morning and evening board an occasion of cheer and delight. Some of the later style of New-York houses are a great improvement on the old ones in the location of this important room; but, as a rule, the whole conception of dining-apartments needs reforming. Set forth your meals, *mesdames*, with every possible condition of elegance, attractiveness, and cheer, and you will thereby gain a new hold upon the admiration and affections of your husbands and sons.

— Mr. Harrison Weir, in the graphic drawing we present on the first page, has most successfully pointed a moral for which the Society for the Prevention of Cruelty to Animals will thank him. The sport of pigeon-shooting, if it may be called a sport, seems a mockery, indeed, when the suffering of its victims are brought so closely home to us. The poor birds, as we see them in Mr. Weir's illustration, left to die in heaps, mangled, mutilated, with backs broken, limbs fractured, flesh torn, and every nerve quivering with pain, may well excite the commiseration of every humane being. Pigeon-matches, which have been so popular and fashionable in England, have recently been gaining ground with us. It is scarcely a fashionable sport yet, but we are usually not long in adopting whatever amusement finds favor abroad. In this case, it is a pity it is so. We could wish that Mr. Bergh's earnest protest against the “sport” last summer had been heeded. It was then feared, by a number of persons preparing for a match of unusual magnitude, that Mr. Bergh's society would interfere and prevent the contest. Hence he was waited upon by gentlemen concerned in the matter, and asked what he intended to do. Mr. Bergh consented not to interpose his authority, but took occasion to express his detestation of an amusement derived from the pain and suffering of harmless birds. The great match came off, regardless of the humane sentiments of those who opposed it; but, in this instance, at least, no such scene occurred as that depicted by Mr. Weir. Mr. Bergh dispatched members of his society to the spot, with directions to look after the wounded birds, and to kill at once all that were in agony. It is sometimes urged in defence of pigeon-matches that the design is to cultivate skill in shooting; but surely this can be obtained without subjecting innocent creatures to pain and suffering. Skill in shooting can be developed by firing at any sort of mark; but this, possibly, would be dull amusement. To a mere contest of skill must be added, it seems, the excitement of killing, so savage and fierce are our natures, under all the show and pretension of our civilization. In England, we learn, the rage for pigeon-matches among the noble and wealthy has induced the formation of linnnet and sparrow shooting clubs by other classes. The demand for victims for the matches has led to such extensive bird-netting all over the country, as to cause an alarming increase of ravenous insects, which small

birds so industriously keep within bounds. This evil, fortunately, will be likely to lead to parliamentary interference, and we may soon see measures taken that will effectually terminate the barbarous sport.

— “The luxury of travel” is the sign that frequently greets the passer-by on our principal thoroughfares. The announcement is the advertisement of the railroad lines, and refers to the sumptuous drawing-room cars that are now connected with through-trains upon almost every road. These cars are, indeed, sumptuous; but travel, in order to be truly luxurious, or even comfortable, demands improvements upon the tracks as well as in the vehicles. Think of the dust that in summer-days becomes so fearful an infliction to the traveller, and which no means are taken to allay! Unless our railroad managers can devise a way to prevent dust, either by sowing the road-side with grass, by watering the track, or by some process gathering up the dust and discharging it in the rear of the train, their “luxury” is a delusion and a snare. A traveller blinded with dust, choked with dust, deaf with dust, and begrimed with dust, is likely to laugh at the notion of “the luxury of travel.” And then there is the intense heat of summer-days, which often renders car-travelling an agony. If the road-sides were planted with trees, and the track thereby shaded, this improvement would contribute one important item to the welfare of travellers. If the time ever comes when splendid drawing-room cars, provided with every essential of comfort, shall dart over tracks properly laid, under umbrageous trees, with a grassy or dustless road-way, then “the luxury of travel” will be a completed fact.

— The word comes from all the sea-coast resorts that a brilliant vacation season may be expected this year. The shores that have been lonely so long will soon now glory in the youth and the beauty of fair visitors, and Gayety will resume her reign over the rocks and the sands and the waves. It is not difficult to fancy the Dryads and the Naiads rejoicing at the change. Even the ancient sea, which all the winter months has beat its dull, sad refrain on the beach, must curl now its white locks in graceful and joyous anticipation. What longing it must feel in its dreary loneliness for the merriment of the summer sea-bathers! and how it must love the laughing girls and stalwart youths that come down to sport in its old arms! Is Nature insensible to the human affections that are offered to it? Cannot the mountains feel a responsive pride in our delight at their stately majesty? Have the woods no kindly sympathy with our rapt pleasure in their ancient shades? Does the sea really feel no tender glow as it tosses too and fro the young beauties from the towns? It would seem as if the mountains and the woods and the sea stood waiting with earnest welcome for us, and that, eagerly as the heart of youth pants for the days of pleasure that summer brings, Nature, too, in the great largeness of its antique soul, opens wide its bosom to the pulse of human feeling. Possibly our coming rural pleasures will gain a little flavor by giving room to the thought. It would do us no ill to

transfer to Nature something of the old Greek personality—much good, indeed, if we found that true voice of Nature which gives “books in running brooks,” and poems in all its many phases of being.

—Referring some weeks since to the gilded and ornamental iron front of the new Appleton Building on Broadway, we predicted a revolution in the architecture of that street. The beginning of this change is already apparent. One fine new building in Bond Street, within a few steps of Broadway, has largely bettered the instruction of the Appleton example, and astonishes every beholder with its polychromatic glories. Other buildings on Broadway have caught up the notion, and gilding in architecture promises to be an established feature of our metropolitan streets. Broadway, indeed, may ere long win for itself a new title, and come to be known as the “Rue Dorée.”

Correspondence.

Lotus-plants.

NEW YORK, May 16, 1871.

To the Editor of Appleton's Journal.

The reference of your correspondent in No. 113 of the JOURNAL to the occurrence of the lotus in Missouri has attracted my attention.

From his very intelligent description, the plant which he admires, I conclude, is the *Nelumbium luteum*, or the Occidental lotus. He will find it described under its above-given botanical name in Professor Gray's “School and Field Botany,” and the word lotus in the index. Professor Wood also describes it, but omits lotus from his index.

The Oriental lotus, *Nelumbium speciosum*, is almost exactly like our American species; but its flowers are pink-white, while ours has, as your correspondent says, “creamy” or yellow-white flowers. The shape of the anthers is also somewhat different in the two species.

Paxton says that the cultivation of this pink-flowered species came into Great Britain from India in 1787, and that of our cream-flowered plant in 1810. He mentions three other species: a pink-flowered one, brought from Malabar in 1813; another pink one, from the Caspian Sea, introduced in 1822; and a pale-blue species from Jamaica, in 1824.

It is probable that several species of the closely-related genus *Nymphaea* have also been designated as lotus-plants. All the species of both genera are prominent; many are magnificent water-plants—their petals beautifully colored and often sweetly scented, their seeds and roots more or less edible by man and brute.

Two species of *Nymphaea*, one blue and the other pink, are said to be natives of Egypt; while no *Nelumbium*, so far as I can just now learn, is claimed as coming originally from that country.

Our strongly fragrant and elegant *Nymphaea odorata* is a well-known and highly-prized water-plant, tolerably common in our Eastern States. The larger, *Nymphaea tuberosa*, abounds West and South.

I hope all these plants may come to be designated lotus-plants, and not water-lilies, since they have no relation whatever to the true lilies, except in their beauty and fragrance.

Some smaller but very interesting plants—the water-shield (*Brasenia*) of our Northern States, and the *Cabomba* of the South—are related to the two genera of lotus-plants. The

former at times exhibits a singular characteristic. Its flower-buds, stems, etc., are often found thickly enclosed by a pellucid, colorless, compacted mucilage, as clear as crystal.

Finally, that gigantic lotus, the *Victoria regia*, with its immense flowers and leaves, one of which may be capable of floating a man, has been the wonder and admiration of plant-lovers since it was brought from Guiana in 1838.

Once more I have to beg that botanists will sternly resist the universal tendency throughout science to *Babelism*, in this, at least, of discouraging the application of similar common or scientific names to wholly dissimilar plants.

There are, to be sure, some water-plants which have a not very distant relation to the lilies; but these lotus-plants, as I have designated the members of the two genera, are not lilies in any even remote sense.

Scientists should remember that the very existence and continuance of science depend on its general popularity. The people at large must be relied upon eventually and ultimately to furnish the material aid without which scientific men, collections, and libraries, cannot be maintained; and they should study, through simplicity, to commend, and not, through complexity, to disgust, the practical people of the world. Above all, they must know how to make their studies acceptable to the youthful recruits who are to be the scientific men and women of the future. Verily, the number of laborers in the fair fields of science is not too great.

J. H.

Literary Notes.

MR. EDWARD B. TYLOR, author of “Researches into the Early History of Mankind,” has just issued from the press of John Murray, of London, “Primitive Culture: Researches into the Development of Mythology, Philosophy, Religion, Art, and Culture.” Beginning with an outline of “The Science of Culture,” Mr. Tylor proceeds to dwell on “The Development of Culture,” attempting “to sketch a theoretical course of civilization among mankind, such as appears on the whole most accordant with the evidence,” and to show that “the main tendency of culture from primeval up to modern times has been from savagery toward civilization.” Next he treats the subject of “Survival in Culture,” showing how that survival, after “placing all along the course of advancing civilization way-marks full of meaning to those who can decipher their signs, even now sets up in our midst primeval monuments of barbaric thought and life.” Passing on to the problem of the “Origin of Language,” Mr. Tylor deals with the question as to “whether speech took its origin among mankind in the savage state,” coming to the conclusion that, “consistently with all known evidence, this may have been the case,” just as his examination of the art of counting leads him to assert that “satisfactory evidence proves numeration to have been developed by rational invention from this low stage up to that in which we ourselves possess it.” Turning to the subject of mythology, which he has examined from a special point of view, with the desire of “tracing the relation between the myths of savage tribes and their analogues among more civilized nations,” Mr. Tylor brings together a mass of evidence in favor of the theory, which he is inclined to adopt, that “the earliest myth-maker arose and flourished among savage hordes, setting on foot an art which his more cultured successors would carry on, till its results came to be fo-

silized in superstition, mistaken for history, shaped and draped in poetry, or cast aside as lying folly;” and then he proceeds “to examine systematically, among the lower races, the development of Animism—that is to say, the doctrine of souls and other spiritual beings in general”—the second volume of his work being mainly occupied with a mass of evidence collected from all quarters of the world, “displaying the nature and meaning of this great element of the philosophy of religion, and tracing its transmission, expansion, restriction, modification, along the course of history into the midst of our modern thought.” Last of all comes an attempt “to trace the development of certain prominent rites and ceremonies,” treating them as the outward expression and practical result of the inmost powers of religion; but investigating them rather from an ethnographic than a theological point of view.

Dr. William Stroud's treatise on “The Physical Cause of the Death of Christ, and its Relation to the Principles and Practice of Christianity,” now first reprinted in this country, has maintained, for the last quarter of a century, a great reputation in England. It is, in its own place, a masterpiece. “It could have been composed,” says Dr. Stroud's biographer, “only by a man characterized by a combination of superior endowments. It required, on the one hand, a profound acquaintance with medical subjects and medical literature. It required, on the other, an equally profound acquaintance with the Bible and with theology in general.” The object of the treatise is to demonstrate an important physical fact connected with the death of Christ—namely, that it was caused by rupture of the heart—and to point out its relation to the principles and practice of Christianity. “It has always appeared—to my medical mind at least,” says Sir James Y. Simpson, in his letter on this subject, “that this view of the mode by which death was produced in the human body of Christ intensifies all our thoughts and ideas regarding the immensity of the astounding sacrifice which He made for our sinful race upon the cross. Nothing can possibly be more striking and startling than the appalling and terrible passiveness with which God as man submitted, for our sakes, His incarnate body to all the horrors and tortures of the crucifixion. But our wonderment at the stupendous sacrifice only increases when we reflect that, while thus enduring for our sins the most cruel and agonizing form of corporeal death, He was ultimately ‘slain,’ not by the effects of the anguish of His corporeal frame, but by the effects of the mightier anguish of His mind; the fleshy walls of His heart—like the veil, as it were, in the temple of His human body—becoming rent and riven, as for us ‘He poured out His soul unto death’—‘the travail of His soul’ in that awful hour thus standing out as unspeakably bitter and more dreadful than even the travail of His body.”

“The Canoness; a Tale in Verse of the Time of the First French Revolution,” is a new volume of verse by a new poet, which the English critics are praising. We give two specimens of the poet's style:

“All things a lover praises; hair that lies
Like down on the white strand
Over pure brows, and faith in fearless eyes,
The light wave of the hand.
The musical clear tones, the manner born
To gracious thoughts, yet capable of scorn.
“The nameless charm of life subdued to law,
Of law that brings new grace.
Make distance greater while they witch and
draw;

Light heart and sunny face
Often in vain. So perfect is not near.
O for the little faults that banish fear!"

"There is, we conceive," says the *Spectator*, "no little power which can turn from the tenderness and grace of verse of this kind to the strong invective of the following passage:"

"Death, is it only death the spectre we dread may come?
Fall not darker shadows at times on the poor man's home?
Come not strange forebodings across us whenever we press
Bride or daughter in loving arms, lest this be the last caress?
Lest the pure eyes coyly drooped, the low tones endlessly sweet,
Eyes that lighten to see us, voice that softens to greet,
Be but quarry for courtly sport, the prey of the tyrant's lust,
While we bow the heavy head, and bear as the peasant must!
Day that our fathers prayed for, when all the wretched should rise,
Day of combat and victory, is this thy star in the skies?
Still the darkness is round us, and scarcely who aids us we know,
Scarcely discern the battle, but grope to close with the foe:
If we strike a brother to earth, not reading the doubtful sign,
Brother, who wouldst have died for us, forgive us, the cause is thine.
If we strike in the flush of wrath when the field is gained and sure,
Blame not ye who know our past: is the blood that flows so pure?
Surely the tavern, the midnight brawl, the vices that stain and sear,
Have had richer harvest from France than we in our vengeance-year!"

THE AMERICAN ANNUAL CYCLOPEDIA, for 1870, has just appeared. This valuable yearly register has now reached its tenth volume. The issue of the present year is of unusual interest. The portion devoted to the United States gives full details, as we learn from the publishers' prospectus, "of the census, so far as completed; the debates in Congress upon important questions; the details of the internal affairs of the United States, the revenue and expenditures of the Government, the measures taken to reduce the public debt, the modifications of its currency; its fluctuations, the changes in the system of taxation to promote the relief of the people, with its effects upon their industrial interests and prosperity; the banking system, with its expansions and contractions; the fruits of agriculture, and the spread of internal trade and commerce; the proceedings in the Southern States to establish securely their social affairs; the various political conventions of the year, both national and State; the results of elections; the acts of State Legislatures; the surprising extension of the facilities of transportation, especially of railroads, etc. The great events in Europe are also fully presented. The civil, military, commercial, and social condition of each nation, with its population by races, is stated; the irresistible march of the German armies in the heart of France is described day by day, and illustrated with complete maps. The proceedings of the Vatican Council and its suspension, the occupation of Rome, and the organization of the Italian Government in the city, are set forth in details. In a word, the present condition and relations of the various nations of Europe, and their transactions during the past year, are fully related." The progress of science; the movements of religious bodies; the record of literature; the mortality among distinguished men; the doings in art—all

have their complete presentation. The book is an exhaustive record of all transactions and events of the year.

The marriage-contract of the Bride of Lamer-moor, we learn from the London *Athenæum*, has quite lately been discovered at St. Mary's Isle, the seat of the Earl of Selkirk. It was evidently unknown to Sir Walter Scott when he wrote the novel. Lord Selkirk is the representative of the family of Dunbar, of Baldoon, and has the family papers in his possession. It was in arranging these that accidentally he came upon this contract of marriage. The four signatures are David Dunbar (the bridegroom), Janet Dalrymple (the bride), James Dalrymple (the bride's father), Baldoon (the bridegroom's father). One of the witnesses, James Dalrymple, may have been the bride's brother, who rode behind her to the church, and whose dagger was said to have been used by the bride. A fac-simile has been taken of the document. Judging from this, there is little tremor in the bride's signature. Messrs. Black, we are glad to hear, are going to publish the fac-simile in their Centenary Edition of the Waverley Novels.

A new revised edition of the late Winthrop Sargent's "Life of Major André" has been published by D. Appleton & Co. "This volume," says Mr. Robert C. Winthrop, "is full of attractive and valuable matter, displaying the fruit of rich culture and rare accomplishments." Mr. Sargent has given to the public several important contributions to history. His "Journal of Officers engaged in Braddock's Expedition," from original manuscripts in the British Museum, with an introductory memoir, which was published under the auspices of the Historical Society of Pennsylvania, was highly praised by Washington Irving, Winthrop, and others. It is the most accurate and thorough account of the Braddock expedition extant. The "Life of André" has been equally fortunate in receiving the commendation, at home and abroad, of capable critics.

Bicknell's "Village Builder" is a handsome quarto volume, containing a large number of designs for "cottages, villas, suburban residences, farm-houses, stables, carriage-houses, store-fronts, school-houses, churches, and court-houses," all accompanied with plans and elevations, and details as to cost in different sections of the country. Fifty-five plates embellish the volume, which appears to have been prepared with care. To those contemplating building it would be valuable.

About a hundred years ago Mathias Claudius, the German poet, whose hymn on the Rhine is still sung by everybody in the Fatherland, published a small weekly journal called the *Wandsbeck Messenger*, of which only about three hundred copies were printed. A few years afterward the paper was discontinued, but full sets of it are now to be reprinted, it having been ascertained that not a few of its articles were written by Goethe, Schiller, and Herder.

Mr. Blanchard Jerrold is about to publish, in London, under the general title of "The Best of all Good Company," a series of "Days" with eminent authors. He begins next month with "A Day with Charles Dickens," to be followed by "A Day with Lord Lytton," and then, in the centenary month, "A Day with Sir Walter Scott," and so on.

MM. Erekmann-Chatrion in their new work, "Histoire d'un Sous-Maitre," which is republished from the *Revue des Deux Mondes*, depict

the humiliating position to which public teachers in France are reduced, owing to the local influences of the clergy or of the authorities, and particularly through the meanness of the budget of public instruction.

Mr. Percy Fitzgerald has in the press a work entitled "The Kembles," consisting of a biography of John Philip Kemble and Mrs. Siddons.

Miscellany.

Mr. Darwin's Hypothesis.

IF, in short, in its general application, Mr. Darwin's hypothesis is utterly unsupported by observed facts, it is still more destitute of such support in its application to man. Mr. Darwin himself admits two things: first, that the difference is immense between the highest monkey and the lowest savage; and, secondly, that "this great break in the organic chain cannot be bridged over by any extinct or living species," or, as he again expresses it, that "the connecting links between man and some lower form have not hitherto been discovered." No monkey has been discovered which is even comparable with man; no race of savages, however degraded, can be regarded as on a level with monkeys. If Mr. Darwin's hypothesis were true, it is almost incredible that no evidence should be producible of the existence of ape-like creatures closely allied to man, and showing a tendency to further development. On the other hand, we have the undoubted and recorded experience of at least four thousand years of history, during which many races of man have been subjected to influences the most diversified and the most favorable to the further development of their faculties. After the lapse of that time man remains as distinctly man as he was before, just as all the animals with which he is acquainted have preserved their specific characteristics. It is more than questionable whether his faculties have in any degree improved. He has accumulated knowledge, he has increased the instruments of his thought and action, and his power has thus been augmented. But there is some reason to think, with Plato, that these numerous aids have actually debilitated his natural vigor of body and mind. At all events, it is in glaring contrast with Mr. Darwin's theory of continuous development to observe that the earliest known examples of man's most essential characteristics exhibit his faculties in the greatest perfection ever attained. No poetry surpasses Homer's; no religious sentiment is more sublime than that in the Book of Genesis; no art is more perfect than that of Greece; no specimens of the human form are more beautiful than the models which Greek sculptors have preserved for us. History is a continuous refutation of the theory that faculties are gradually called into existence by circumstances. On the contrary, they seem to start fully formed from the brain of man, and to work out their inherent power for the modification of circumstances. Race after race appears on the scene—the Egyptian, the Jew, the Greek, the Roman, the German, each with some special endowment working, as it were, in its blood with inexhaustible vigor. The endowment is applied in various ways, and its forms are multiplied; but it seems to lose, rather than to gain, in fulness and fervency by the lapse of time and the course of experience. The real problem of life lies in that mysterious fertility, at once so constant and so variable, by which the same nature is constantly reproduced, but by which,

from time to time, germs of new energy seem developed. The solution of this problem is to be sought, not in Mr. Darwin's facile method of observing superficial resemblances, but in the difficult task of penetrating into hidden differences. It is a problem which will be solved, if at all, not by romances in human and natural history, but by minute investigations with the microscope and in the laboratory.

We wish we could think that these speculations were as innocuous as they are unpractical and unscientific, but it is too probable that, if unchecked, they might exert a very mischievous influence. We abstain from noticing their bearings on religious thought, although it is hard to see how, on Mr. Darwin's hypothesis, it is possible to ascribe to man any other immortality, or any other spiritual existence, than that possessed by the brutes. But, apart from these considerations, if such views as he advances on the nature of the moral sense were generally accepted, it seems evident that morality would lose all elements of stable authority, and the "ever-fixed marks," around which the tempests of human passion now break themselves, would cease to exert their guiding and controlling influence. Mr. Darwin is careful to observe that he does not wish "to maintain that every strictly social animal, if its intellectual and social faculties were to become as active and as highly developed as man, would acquire exactly the same moral sense as ours." If this be the case, why should our existing moral sense be deemed a permanent standard? "If, for instance," says Mr. Darwin, "to take an extreme case, men were reared under precisely the same conditions as hive-bees, there can scarcely be a doubt that our unmarried females would, like the worker-bees, think it a sacred duty to kill their brothers, and mothers would strive to kill their fertile daughters, and no one would think of interfering." What is this but to place every barrier of moral obligation at the mercy of the "conditions of life?" Men, unfortunately, have the power of acting, not according to what is their ultimate social interest, but according to their ideas of it; and, if the doctrine could be impressed on them that right and wrong have no other meaning than the pursuit or the neglect of that ultimate interest, conscience would cease to be a check upon the wildest, or, as Mr. Darwin's own illustration allows us to add, the most murderous revolutions. At a moment when every artificial principle of authority seems undermined, we have no other guarantee for the order and peace of life except in the eternal authority of those elementary principles of duty which are independent of all times and all circumstances. There is much reason to fear that loose philosophy, stimulated by an irrational religion, has done not a little to weaken the force of these principles in France, and that this is, at all events, one potent element in the disorganization of French society. A man incurs a grave responsibility who, with the authority of a well-earned reputation, advances at such a time the disintegrating speculations of this book. He ought to be capable of supporting them by the most conclusive evidence of facts. To put them forward on such incomplete evidence, such cursory investigation, such hypothetical arguments as we have exposed, is more than unscientific—it is reckless.—*From a Review in the London Times.*

A Letter from Sherman.

When Sherman, in 1864, was on his march to the sea, a clergyman in Alabama, whose horse had been taken from him by a Michigan soldier early in the war, applied to the general

for restitution, and received the following answer, for a copy of which we are indebted to W. G. Poole, of Tallahassee, Florida:

"HEADQUARTERS MILITARY DIVISION OF THE }
MISSISSIPPI, ATLANTA, September 16, 1864. }

"Rev. J. H. Willoughby, D. D., Chaplain
Eighteenth Alabama Regiment, Confederate
Army.

"DEAR SIR: Your letter of September 14th received. I approach a question involving the title to a horse with great deference, for the law of war, that mysterious code of which we talk so much but know so little, is remarkably silent on the 'horse.'

"He is a beast so tempting to the soldier—to him of the wild cavalry, the fancy artillery, or the patient infantry—that I find more difficulty in recovering a worthless, spavined horse than in paying a million of 'greenbacks.' So I fear I must reduce your claim to one of finance, and refer you to the great Board in Washington that may reach it by the time your grandchild becomes a great-grandfather. Privately, I think it was a shabby trick in the scamp of the Thirty-first Michigan Regiment who took your horse, and the colonel or his brigadier should have restored him, but I cannot afford to undertake to make good the sins of omission of my own colonels or brigadiers, much less those of a former generation.

"When this cruel war is over, and peace once more gives you a parish, I will promise, if near you, to procure out of Uncle Sam's corals a beast that will replace the one taken from you so wrongfully, but now 'tis impossible. We have a big journey before us, and will need all we have—and I fear more, too—so look out when the Yanks are about and hide your beasts, for my experience is that all soldiers are very careless in a search for title. I know General Hardee will confirm this my advice.

"With great respect, yours truly,

"W. T. SHERMAN,

"Major-General."

American Sympathy—German Courtesy.

Among the surgeons of the great military barracks of Sempel Hofer Feld, near Berlin, is Dr. Rankin, from Newburg, New York. Not long ago some ladies of Newburg made up and sent to him a box containing delicacies and articles of comfort for the wounded soldiers of those barracks similar to those sent to our own soldiers during our late civil war. This box and contents were most enthusiastically received, and afforded the highest gratification to the soldiers.

The comfort-bags, each containing, in addition to many articles of utility, a small American flag, were especially prized, and each patient, as he received his flag, fastened it at the head of his bed, so that, to a casual observer, the barracks appeared to contain a group of American rather than German patients. The barracks have been frequently visited by her majesty the empress and her imperial highness the crown-princess, who have been untiring in their devotion, tender sympathies, and practical kindness, to their wounded soldiers. Some of the comfort-bags were more elaborately worked, and fell into the possession of the empress and crown-princess. Their estimate of them is shown by the following translation of an autograph letter, dictated to the Baroness von der Laneken, wife of the private secretary of her majesty, and sent to Dr. Rankin's family at Newburg:

"BERLIN, April 8, 1871.

"I beg leave to express to the family of Dr. Rankin, as well as to all those who took part with them in sending the rich presents for the

barracks at this place, with what pleasure this proof of philanthropic sympathy from the far West has been received, and how thankful we are for it. But, at the same time, I wish to add my personal thanks, which are as warm as they are sincere. (Signed)

"AUGUSTA.

"To the Baroness von der Laneken."

The letter was accompanied by a handsome brooch, bearing her majesty's coat-of-arms, in gold, on the reverse.

Monarchy in England.

If royalty is a superfluity, why waste money on it? The ministry will ere long have to answer that question, and they will, we imagine, find it not a little difficult to make their answer intelligible to the people who are putting the question forward. There is no answer conclusive to rough and simple minds. Mr. Wintherbotham's, that monarchy is durable, that it saves us from three revolutions in sixty years, is, in the first place, historically untrue, and, in the second, is no answer to the questioners. The oldest government in Europe is an elective despotism, the papacy; the most stable was a close oligarchy, that of Venice; the one least likely to be rebelled against is a republic, Switzerland. Monarchy, by limiting the action of the popular will, causes, not prevents, revolutions, which, again, are not formidable things to the classes now in political motion. Nor is it an effective answer to say that monarchy "keeps up society"—maintains, that is, those grades and differences of *status* which the upper classes so highly value—for the opponents of the monarchy are the opponents also of this very result, which to them seems bad, and not good. And, finally, we take it, the historic plea, which weighs so heavily with all cultivated men, will be nearly useless here. The people of England, partly owing to the gross neglect of the upper classes, partly owing to a certain defect of imaginative interest in the past, do not know English history, do not understand how unbroken English tradition has been, how complete has been our escape from social wars, and, if they did understand, would probably reply: "History is grand to you; what has it done for us? It may be beyond measure glorious; but still it has for us, the real people, been a failure. Half of us, the peasantry, pass lives of monotonous toil to earn insufficient wages, and die at last in the work-house; and the other half, though better off, have but just been placed in possession of their fair share in the government of the country. Even now they enjoy neither equality nor comfort. The historic system, which has, after eight hundred years, produced so poor a result, may be bad or good; but it certainly is not so good that its result alone should be sufficient to limit political experiment."

A Virtuoso.

"Art is the helpmate of Humanity."—POPULAR ERROR.

Be seated, pray. "A grave appeal?"

The sufferers by the war, of course;

Ah, what a sight for us, who feel—

This monstrous *melodrame* of Force!

We, sir, we connoisseurs, should know

On whom its heaviest burden falls;

Collections shattered at a blow,

Museums turned to hospitals!

"And worse," you say; "the wide distress!"

Alas, 'tis true distress exists,

Though let me add, our worthy press

Have no mean skill as colorists.

Speaking of color, next your seat

There hangs a sketch from Vernet's hand;

Some Moscow fancy, incomplete,

Yet not indifferently planned.

Note specially the gray Old Guard,
Who tears his tattered coat to wrap
A closer bandage round the scarred
And frozen comrade in his lap;
But, as regards the present war—
Now, don't you think our pride of pence
Goes—may I say it?—somewhat far
For objects of benevolence?

You hesitate. For my part, I—
Though ranking Paris next to Rome,
Æsthetically—still reply
That "Charity begins at home."
The words remind me. Did you catch
My so-named "Hunt?" The girl's a gem;
And look how those lean rascals watch
The pile of scraps she brings to them!

"But your appeal's for home," you say,
"For home, and English poor!" Indeed!
I thought Philanthropy to-day
Was blind to mere domestic need—
However sore—yet though one grants
That home should have the foremost claims,
At least these Continental wants
Assume intelligible names.

While here with us—ah, who could hope
To verify the varied pleas,
Or from his private means to cope
With all our shrill necessities!
Impossible! One might as well
Attempt comparison of creeds;
Or fill that huge Malayan shell
With these half-dozen Indian beads.

Moreover, add that every one
So well exalts his pet distress,
'Tis—Give to all, or give to none,
If you'd avoid invidiousness.
Your case, I feel, is sad as A's,
The same applies to B's and C's;
By my selection I should raise
An alphabet of rivalries.

And life is short—I see you look
At yonder dish, a priceless bit;
You'll find it drawn in Brongniart's book,
They say that Raphael painted it—
And life is short, you understand;
So, if I only hold you out
An open though an empty hand,
Why, you'll forgive me, I've no doubt.

Nay, do not rise. You seem amused;
And yet one must have principle!
'Twas on these grounds I just refused
Some gushing Lady Bountiful—
Believe me, on these very grounds.
Good-by, then. Ah, a rarity!
That cost me quite three hundred pounds—
The Dürer figure—"Charity."

Law of Evolution.

In a recent lecture before the post-graduate class at Harvard University, on the "Law of Evolution," Mr. John Fiske draws the following comparison between the labors of Sir Isaac Newton and Mr. Herbert Spencer: "Laplace has somewhere reminded us that, while gratefully rendering to Newton the homage due him for his transcendent achievements, we must not forget that he was singularly fortunate in this—that there was but one law of gravitation to be discovered. The implication that, if Newton had not lived, Laplace might himself have been the happy discoverer, is perhaps a legitimate one, though it does not now especially concern us. But the implied assertion that Nature had no more hidden treasures comparable in worth and beauty to that with which she rewarded the patient sagacity of the great astronomer is one which recent events have most signally refuted. We now know that other laws remained behind—as yet others

still remain—unrevealed; laws of Nature equaling the law of gravitation in universality, and, moreover, quite as easy of detection. For, while it may be admitted that the demonstrations in the 'Principia' required the highest power of quantitative reasoning yet manifested by the human mind; and, while the difficulties and discouragements amid which Newton approached his task, destitute as he was alike of modern methods of measurement and of the resources of modern analysis, impress upon us still more forcibly the wonderful character of the achievement; it must still be claimed that the successful coördination of the myriad-fold phenomena formulated by the law of evolution was a gigantic task, requiring the full exertion of mental powers no less extraordinary than those required by the other. In an essay published ten years ago youthful enthusiasm led me to speak of Mr. Spencer's labors as comparable to those of Newton both in scope and in importance. More mature reflection has confirmed this view, and suggests a further comparison between the mental qualities of the two thinkers; resembling each other as they do, alike in the audacity of speculation which propounds far-reaching hypotheses and in the scientific soberness which patiently verifies them; while the astonishing mathematical genius peculiar to the one is paralleled by the equally unique power of psychologic analysis displayed by the other. As in grandeur of conception and thoroughness of elaboration, so also in the vastness of its consequences—in the extent of the revolution which it is destined to effect in men's modes of thinking, and in their views of the universe—Mr. Spencer's discovery is on a par with Newton's."

Foreign Items.

ONE of the curious features of court-life under the second empire was the fact that nearly all the prominent ladies at the Tuileries, including the empress herself, were in the habit of consulting certain fortune-tellers on the events of the future. Three of them especially received frequent visits from Eugénie and her ladies of honor: Mmes. Lenormand and Leclercque, and an old soothsayer and magician named Dr. Manricardi. The latter died recently in Paris, and among his papers was found a diary containing most singular disclosures about the state of affairs to which we have referred. It is said that this curious diary will be published at an early day.

At the sale of the furniture, etc., found in the private apartments of the dethroned imperial family at the Tuileries, the library of the Empress Eugénie, containing about eleven hundred volumes, many of which bear autograph dedications from distinguished authors to the empress, was purchased by an agent of M. de Villemeussant, the proprietor of the *Paris Figaro*, with a view, it is said, of restoring the library to the ex-empress.

Isaac Brown, an American adventurer, who defrauded certain bankers in Vienna out of large sums of money by means of forged letters of credit, has been sentenced by the Criminal Court of that city to three years' imprisonment. Every other day of his term of confinement Brown will be fed exclusively on bread and water.

Jean Jacques Offenbach writes to a friend in Brussels that he is not at all discouraged by the heavy losses he had sustained in consequence of the Franco-German War. He said

he had been very industrious during the time of his exile from France, and had written several new *operettas* which, he would lay a wager, would be performed at an early day in Paris.

The domestic troubles of the imperial family of Russia seem to be growing worse and worse. It is now said at St. Petersburg that the emperor and his eldest son are no longer on speaking terms, and that the empress refuses to hold any intercourse with her daughter-in-law, the hereditary grand-duchess.

Bibliomania seems to be on the increase in Europe. Scarcely has the sensation created by the thefts of Dr. Pichler at the Imperial Library of St. Petersburg passed away, when now comes the news that a prominent professor at the University of Leyden has purloined most of the valuable manuscripts from its library.

Three heavy golden vases were lately found at Pompeii, in the middle of a street, only a few feet under the ground. It is believed that they were carried by priests in a procession to propitiate the gods, and that the bearers were killed while moving through the streets.

Hans Christian Andersen recently visited his native city on the island of Tyen. There was great rejoicing among the people in consequence of his appearance among them, and the place was illuminated every night while he remained.

The Hamburgers talk about founding a university in their city, and the newspapers of the place express the firm conviction that the capital required for the purpose could be easily raised in the course of a few weeks by voluntary contributions.

The widow of Levallant, the celebrated French traveller, whose books on his adventures in Africa formed the delight of our grandfathers, died recently at Lafions, in France, at the advanced age of one hundred and two years.

Madame Adelaide Ristori has cancelled her engagement with the managers of the Theatre Royal in Madrid, because the latter did not pay the sums due to the Righera troupe, a prominent member of which is a cousin of the distinguished Italian *tragedienne*.

Hacklander, the German author, has lost his eyesight. Ever since a prolonged journey in the Orient he has been in danger of becoming blind. He is a wealthy man, and owns one-half of the Stuttgart Illustrated News (*Ueber Land und Meer*).

The brewers of Munich are quite indignant at the declaration of Baron Justus von Liebig that samples of Cincinnati beer submitted to him for examination are equal to the best article manufactured at the breweries of the Bavarian capital.

They say in Berlin that the Grand-duke Frederick Francis of Mecklenburg-Schwerin, who held a prominent command in the war of 1870, has recently shown unmistakable signs of insanity. He is a grandson of Queen Louisa of Prussia.

An idea of the value of the works of art and precious books destroyed within Thiers's house in Paris may be formed from the fact that they were insured for four hundred thousand francs.

Homburg, it is said, will this summer be the rendezvous of the Bourbonist and Orleans politicians. The Prince de Joinville, the Count

de Paris, and the Duke de Chambord, are expected there at an early day.

Richard Wagner received from the Emperor William, for the dedication of his "Imperial March," simply a diamond ring, and not a large sum of money, as had been previously reported.

The people of Copenhagen are greatly distressed at the impending closing of the Tivoli, their famous place of amusement, and a national subscription is talked of to enable the proprietor to keep it open.

M. Rudolf Gottschall, one of the most esteemed of German critics and poets, expresses, in a recent article on American poetry, his surprise at the popularity of Bret Harte's productions.

Germany has had many historians, but, according to the opinion of her most eminent literary critics, has not yet a history of Germany worth the name.

Kissengen, the famous German watering-place, will be enlivened this summer by the presence of three emperors, four kings, and a large number of minor princes.

Until the 1st of July, 1870, one hundred and two persons had committed suicide by jumping down from the now destroyed Vendôme column.

An old prayer-book, containing marginal notes from the hand of Martin Luther, was recently sold for two hundred florins at Stuttgart.

The Empress of Germany dresses generally very unostentatiously. Her dry-goods bills are said to be lower than those of most of the wives of the Berlin merchant-princes.

Short-hand writers in Germany command comparatively large salaries. The stenographers of the German Parliament receive ten dollars daily.

The venerable German philosopher Ludwig Feuerbach lives on his small farm in such reduced circumstances that a national subscription is proposed for him.

The *Leipzig Central Blatt* says that Mr. Bancroft, during his residence in Germany, has collected materials for a history of Europe since the *coup d'état* of December 2, 1851.

Miss Hedwig Raabe, the great German actress, it has now been definitely decided, will not come to the United States. She returns to St. Petersburg.

Mlle. Rivière, whose political lectures in France during the last years of the second empire attracted so much attention, has opened a school for political speakers at Bordeaux.

The Emperor of Russia likes best to read German books, and the Emperor of Germany prefers French works.

Dr. Max Ring, the author of the historical novel "John Milton and his Times," is one of the most popular physicians of Berlin.

In Germany, Dresden has the largest number of American residents. Next comes Heidelberg, and then Berlin and Leipzig.

King Francis II. of Naples will take up his abode on a country-seat near Pesth, in Hungary.

M. Thiers alone, of all the members of the Versailles Government, has some knowledge of the German language.

Thalberg was wealthy, and must have left a fortune of several hundred thousand dollars.

George Sand has openly declared her sympathies for the cause of the Red Republicans.

Greece has four translations of Byron and two of Halleck's poems.

Varieties.

THE Atlanta *Sun* says this is the way a Georgia witness "explained it:" "The plaintiff altered, amended, explained, and expounded, but all to no purpose, as the lawyer either could not or would not understand. 'I want you,' he said, 'to show me how the assault was committed, so that I may have a correct understanding of it.' The plaintiff sprang up instantly, seized the legal gentleman by the coat with both hands, pressed him back across the bar, and shook him violently, to the amusement of all present, and to the aforesaid lawyer's entire enlightenment."

The following calculation is said to show the relation which should exist between height and weight in a healthy person, speaking generally, of course: A man 5 feet 1 inch high should weigh 120 pounds; 5 feet 2 inches, 126 pounds; 5 feet 3 inches, 133 pounds; 5 feet 4 inches, 139 pounds; 5 feet 5 inches, 142 pounds; 5 feet 6 inches, 145 pounds; 5 feet 7 inches, 148 pounds; 5 feet 8 inches, 155 pounds; 5 feet 9 inches, 162 pounds; 5 feet 10 inches, 169 pounds; 5 feet 11 inches, 174 pounds; 6 feet, 178 pounds.

In Wilmington, Delaware, the trustees of the poor have resolved to revolutionize the method of treatment at the almshouse, and have elected homœopathic physicians in place of those of the allopathic school. The next largest charitable institution in that place has also been placed under homœopathic management.

Tom Moore said to Peel, on looking at the picture of an Irish orator, "You can see the very quiver of his lip." "Yes," said Peel, "and the arrow coming out of it." Moore was telling this to one of his countrymen, who answered, "He meant *arraha* coming out of it."

The last scientific sounding experiments in the Atlantic show an upper stratum of warm water, seven to eight hundred fathoms deep, moving northward, and the entire deeper stratum below, of almost icy coldness, moving southward from the Arctic basin.

A Southern paper says: "Virginia housewives make the best of pickles." Perhaps on the score of acidity they might do very well, but we should think the size of such pickles would be rather objectionable. Give us cucumbers instead.

Deaf and dumb clerks are on trial in some of the departments in Washington. There is no reason why they shouldn't succeed. Dumb waiters were introduced in all the leading hotels long ago, and have satisfied everybody.

It is related of a certain traveller that, being in a wild country where he could find no provisions for himself or dog, he cut off the dog's tail and boiled it for his own supper, and gave the dog the bone.

A gentleman of experience has discovered one good thing in sea-voyaging. He says: "You can get as tight as you please every day, and every body will think you are sea-sick."

A few iron nails placed in a vase with flowers, will keep the water sweet and the flowers fresh. This arises from the sulphur eliminated from the plants combined with the iron.

An exchange tells of a negro who insisted that his race was mentioned in the Bible. He said he had heard the preacher read about how "Nigger Demus wanted to be born again."

The Irish immigration to America, formerly so extensive, is now rapidly on the decrease. English and French immigration is increasing, while that from Germany is the largest.

The sixpenny edition of Sir Walter Scott's works, published in Edinburgh, has been the most successful of all that have ever been issued.

Mr. Caldwell, the new Senator from Kansas, is worth three million dollars. Out on the frontier, among the Indians, such a property-holder is Caldwell off.

Michelet, the French historian, says that what some nations accomplish by reform and others by emigration the French achieve by periodical blood-letting.

It costs two million dollars to build, and three hundred and seventy-five thousand dollars a year to run, a first-class American naval vessel.

The chief engineer of the Boston Fire Department reports that thirty per cent. of the fires in American cities are caused by the deposit of ashes in wooden boxes or barrels.

The *Journal of Chemistry* announces that the human body contains phosphorus enough for four hundred boxes of matches, but not quite sulphur enough for them.

Some one who has recently been studying John Ruskin pronounces his face the homeliest he has ever seen, and Ruskin the heartiest hater of America contained in all England.

The Chicago woman-barber has so many customers that she has taken a younger sister into the business, who attends exclusively to the lathering.

A paper having had an article headed with the conundrum, "Why do wives fade?" a contemporary "supposes it is because they won't wash."

A Sedalia (Missouri) editor says that a girl who is now called "a beautiful blonde" would, a few years ago, have been termed "a tow-head."

What pleased the Japanese best in our financial system was General Spinner's signature. They read it at once as classical Japanese.

It is remarked that Paris, which piques itself on being the brain of the world, has lately suffered much from determination of blood to the head.

A matronly cat in care of her kittens is an instance of severe maternal discipline. She is licking her offspring pretty much all the time.

According to the State geologist of California, the view from the top of Mount Diablo is the finest in the world, not excepting any in the Alps.

The woman who maketh a good pudding in silence, is better than one that maketh a tart reply.

Castelar, the leader of the Spanish republicans, has recently inherited a very large fortune.

A colored man from Charleston, South Carolina, is practising medicine with great success in Egypt.

A party by the name of Jones has written a book to prove that "The United States is the Kingdom of Heaven."

A contemporary says of a very prominent militia general, that "his sword was never drawn but once—and then in a raffle."

Every good business man should have his private Biz-mark.

What's the proper age for a parson? The parsonage, of course.

There are in New York about one hundred members of the Orthodox Greek Church.

Charles Sumner has one of the finest collections of engravings in the country.

When is a lawyer strongest? When he is fee-blest.

Innocence is like an umbrella—when once lost, we may never hope to see it back again.

Every bird pleases us with its lay—especially the hen.

FISHING OFF BARNEGAT LIGHT-HOUSE, NEW JERSEY. See page 735.

MAIDENS' HEARTS.

FROM THE GERMAN OF ELISE POLKO.

THE parish villages of Grünheim and Langenau lie not far apart, the one upon the hem of the forest, its pretty parsonage-garden separated only by the width of a carriage-track from the nearest trees; the other, pushed back into the billowy plain at the foot of a little hill encircled by meadows and orchards.

The trestle-work of railways had not yet indented this mellow soil, and never had the sudden pant and scream of the iron horse been heard from afar, terrifying all living creatures as he rushed by.

A dreamy peace reigned in this happy valley. It sounded like a fairy-tale when the young pastor of Langenau, who had come thither with his mother scarcely a year before, told of the great university city beyond the mountains, whose soft outlines bounded the horizon.

Travellers seldom entered this region, since there was no watering-place in the vicinity, and no accessible romance of rocks and cascades. Books and papers found their way in very limited numbers to the villages, the latter only in their old age, which, nevertheless, did not prevent the two daughters of the Grünheim pastor from seizing with joyful impatience the package brought by the country messenger on the first of every month.

The materials for the modest toilet of the ladies were ordered from the nearest country-town and modelled by their own hands after patterns which had served the French empress at the opening of the previous year.

Elfrieda, the younger, always welcomed with especial joy the arrival of new books.

"There is nothing left for me to read in papa's library," she would sigh. "The learned books I do not understand; Goethe I cannot bear, now that I know the story of poor Frederika of Sesenheim; Schiller I know by heart already; Wieland and Herder do not relish every day; and my own Jean Paul, whom, after papa, I love best in the world, mamma is always taking away from me, because she says he does me no good. It is a bit of good fortune that I can read aloud to the pastor's mother at Langenau out of 'Hesperus,' and 'Titan,' and all Jean Paul's other books."

And so she did often, and, while she read, a side-door swung noiselessly ajar. There was the study of the young minister. He could be seen sitting at his writing-desk, apparently deep in his work, but the page before him lay unstained, while his eyes were often raised to admire the picture which the opening of the door disclosed—a slender, blond maiden seated on a low stool at the feet of the woman whom he loved best on earth—his mother.

Sometimes, later, he would join them in the parlor, and all three talked together of what had been read. Here, as nowhere else, Elfrieda gave free course to her heart, her fanciful little head, and her tongue, until a still, soft, and beautiful woman's hand was laid upon her fair brow, and a gentle voice said, half-chidingly, half in tenderness, "Be still, my child. You understand nothing of all this."

"Let her alone, mother," another voice would entreat, but, the deciding word once spoken, the young girl laughed and blushed, and the conversation returned to subjects of every-day life.

An end was always put to such interviews by the arrival of the pastor of Grünheim, who came to fetch his little daughter home, but remained a while, discussing theological questions with his young colleague.

Once, when father and daughter had gone—accompanied part way, as usual, by the mother and son—the old lady said:

"What a swarm of fancies whirl through the brain of a young girl like her, and what a blessing it would be if such a chaos were illuminated by the hand of a kind and judicious man! Then, indeed, our little Elfrieda would grow to be the noblest of women, for she has the one thing most needed—a warm heart. But she must herself find the way to that guiding hand—no one can give her counsel."

"Let us go once more into the forest, dear cousin," said Woldemar Wellen, the guest of the Grünheim parsonage, one afternoon in the late autumn. "I feel like singing 'Farewell, thou beautiful wood!' I shall see it no more until next summer. Come, Elfrieda, you have nothing to do in the house—will you go?"

Elfrieda was sitting on one of the garden-benches, tracing all sorts of mystic characters in the sand with a hazel wand, and rubbing them

out again with her pretty slipped foot, while her questioner, a cigar between his lips, walked back and forth before her.

Asters and chrysanthemums were blooming in luxuriant profusion, late roses stood in the garden-beds, and the withered leaves already lay quite thick along the path.

It was past two o'clock, and deep stillness reigned in the parsonage.

The father and mother were locked in their mid-day slumber, and Anna, the elder sister, had withdrawn herself to a solitary corner with one of the books which Woldemar had brought—a novel by Turgenieff, in the masterly translation of Bodenstedt.

"How much better it would be if you were not to go back any more into that world which everybody calls so wicked and frivolous!" said Elfrieda, suddenly, instead of replying. "It is not good to live there. I am sure of that, notwithstanding you can describe so beautifully your employments and the people of your society."

"I used to be happy there, I think, but now the thought of it does not please me. However, it cannot be long before I shall grow wonted to it again. But, really, I like best to stay in New Sesenheim, where it is more beautiful than anywhere else in the world, even though Goethe—"

"Hush! Why do you vex me with your Goethe? You know that I cannot abide him for forgetting poor Frederika. I would never leave Grünheim, but Anna—"

"Anna! Do you really think that she—"

"Certainly. Have you not seen how her cheeks always burn when you tell her about the world outside? And, indeed, she might go away at any time, for she has a godmother living at Rossock who invites her every year. Anna only writes to her at New Year's, and she always replies immediately. It is no small task to fill the pages, I assure you, for I always help Anna, she dislikes writing so much!"

"Anna—yes, she would excite great attention," he said, in a suppressed voice, with a wholly altered expression of countenance, "should the marvellous statue be animated, and some one discover the magic word which should teach those eyes the glance of love."

The young girl looked at him in astonishment.

"Statue! Love! Are you dreaming, cousin?"

Woldemar Wellen turned.

"You are right. I was dreaming. But I never saw a more beautiful or a colder lady than your sister."

"Are you in earnest? Is Anna really so beautiful?"

"Yes—but can you not see it yourself?"

"How should I? Can I compare her with other women? But she is not cold. Why, she loves me so dearly that she would give me any thing she possesses without a word. Only she has so earnest a life. How could any one who sings like Anna be cold? But come, dear cousin, we will go into the forest. Shall you take your portfolio along?"

"Certainly; I must sketch the old beech-tree once more."

They went slowly down the garden, opened the little wicket-gate, and entered the wood—a handsome pair, thus sauntering side by side.

The young man was tall and slender, with dark hair and eyes. His bronzed features were finely cut, and his winning smile—for he smiled often—disclosed the finest teeth flashing under his black mustache. His manner exhibited that blending of vivacity and indolence always so dangerous to the female fancy; no one before had brought to the quiet parsonage that easy self-assurance peculiar to the man of the world.

No woman's heart is ever quite inaccessible to the charm of those attentions which Woldemar Wellen observed as scrupulously toward his so-called aunt and her daughters as toward his noble patronesses and charming lady-friends in the world outside. He appeared on the scene as a kind of romantic hero, more piquant than all the newspaper stories, and carrying captive the fancy of his young cousins in a moment.

Now, for the second time, he was watching the forest "paint itself" in this seclusion, while he prepared himself by interesting tree-studies and sketches for the elaboration of those larger landscape-pictures which were the pride of his patron's noble saloon.

He had only by chance discovered his distant relationship to the pastor's family, whom he now playfully termed the dwellers in New Sesenheim, insisting that his little cousin Elfrieda was the exact image

of Goethe's Frederika. And, indeed, she bore some outward resemblance to that lovely type of womanly beauty.

She was a blonde, delicate and slender, but her eyes were brown, with long lashes, and her profile more perfect than Frederika's, whose little turned-up nose seemed to scan the world with saucy curiosity.

Anna, the elder sister, was strikingly beautiful, and of a form whose perfect outlines her plain, old-fashioned toilet could not mar. She seemed to have arrayed herself in some sportive disguise, so strangely did the head, with its strongly-defined lineaments; the mouth, with its antique curve; the deep-blue eyes, with their long lashes and faultless brows; the black hair and the regal form—compare with the dress of a country-pastor's daughter. Waiting so gracefully at the modest table, or walking hand in hand with her mother, she might have been taken for some disguised princess out of the old stories who served as a waiting-maid to win the king's son. She moved amid her surroundings like an actress studying a strange rôle. All her household duties were scrupulously performed, but she loved best, when her father was away, to shut herself up and read in his study.

The education of both sisters had been carefully attended to by their father, but only Anna perseveringly learned the Latin vocabularies or reached first grade in mathematics and physics.

Elfrieda's Latin, as her teacher said, was limited to the conjugation of *amo*, and she disclaimed an enthusiasm for any of the natural sciences, except botany. She was the companion of all her father's walks, plucking great handfuls of flowers, or catching gay butterflies to let them go again, and entering with him, like a good fairy, the abodes of want and wretchedness.

To her alone the good man read his sermons every Saturday evening—sermons full of love and gentleness—and a happy smile played about his mouth while she assured him that "*this* one was more beautiful than all the others." But, indeed, the most absurd and illogical arguments in the world would have been eloquence to her from *his* lips. To Elfrieda's mind, her father was the ideal man embodied; and when, after the fashion of girls, she dreamed of housekeeping, her future lord always appeared in just such a study, wearing a long, gray coat, and she sat beside him on the sofa, as with her father—only she could not imagine the oil-spot on the checkered blue cover, in her new dwelling, or the pipes. But she would, on no account, be willing to marry a minister—so she explained to her father—she must have somebody to whom she could be like an angel, some man half lost, or inexpressibly unfortunate. Some suitable obstacle must be interposed between her future love and its happy fruition. Her foolish little heart was bent on experiencing something extraordinary, doing something admirable. Let there be no quiet, commonplace happiness—either a career, or—a sacrifice!

Ah! how the breath of real love extinguishes all such girlish dreams, as if they had never been! How we come gradually to see that what we thought the fulfilment of all our charming fancies, differs from them, as the autumn day from the spring morning!

Elfrieda told all her heart, but no one knew what Anna dreamed. Her nature had been reserved and reticent from childhood. Only Elfrieda's gay winsomeness she could not withstand, however much she sought to repress her undue enthusiasm.

The father and mother differed in their estimates of the characters of their children. The pastor's wife was anxious for the beautiful, quiet daughter.

"It seems as if she were not in her right place here, as if she belonged somewhere else, and would gladly be away—and yet she would sooner die than betray her wishes. But Elfrieda never troubles herself about any thing—she will have an easy life."

"My anxiety is for our little one," replied the minister. "Fanciful creatures like her often strike upon wrong paths and do something evil, out of very zeal for accomplishing extraordinary good. My one consolation is, that some time a true and noble man will take her to his protecting arms. Walter Heimbürg, the young pastor of Langenau, loves the child, and has opened his heart to me; but we must say nothing of it to Elfrieda. That she will love him in time, I do not doubt for a moment. Anna could, at need, go alone through life—she is made of iron and steel. Elfrieda would be lost without a faithful, guiding hand. I am sure that she will clasp the right hand at the right moment."

After supper, as they sat together in the parlor, or in the grape-arbor, the old spinet was wont to hum and vibrate under Anna's

hands, while her thrilling contralto voice sang ballads and folk-songs which the dead chorister had taught her. And, sometimes, at the sound, Elfrieda felt a strange trembling in her heart. Was that her calm, quiet sister, who thus sang? Whence came this ardent ray, this breathing glow? But, the song once ended, Anna would rise, take her sewing in her hand, or go into the kitchen, with the same tranquil unconcern as before.

Into this story-like peacefulness Woldemar Wellen had suddenly brought the restless element of his modern artist-life. It was but natural that Elfrieda's eyes should require some time to accustom themselves to the appearance of her elegant cousin. A man out of the great world, with all the toilet accompaniments of a hero of the saloon, could not fail to impress her vividly. Then, too, the conversation and manners of her cousin were as fresh and attractive as his ruffles, or the graceful *krakelée*. Different was he from the young minister, who spoke from the pulpit, or within the best social circles. He seemed to find herself cornered by the handsome feet of the artist. His remarkable work—of her father's boots, and she admitted her cousin's favor with a lively, but secret annoyance, though the slender, finely-knuckled fingers of the pastor of Langenau should also be encased in an awkward black-and-white envelope, where two hands might have found ample room. She had anxiously watched Walter Heimbürg's manner in the presence of her cousin, and had given herself much vain trouble to bring the young men nearer to each other. She could not listen quite so eagerly, if the minister were there, when Woldemar Wellen told of the world outside; and, in his fascinating way, unrolled the most graphic pictures of society. His estimate of his lady-acquaintances had a strange sound, and his smile, as he described their fascinations, quite dismayed his listeners.

"The proud butterflies let themselves be caught only too easily," he said, "and forget the charm there is for the masculine nature in what is hardly won. I believe that I could love a woman to distraction, if she—despised me!"

When, in the midst of a ravishing description of those wonderful mazes of fashion, whose doors, he said, would not be closed for an hour against the lovely creatures before him, he asked, playfully, if his sweet cousins had no desire to know such a paradise, Elfrieda threw her arms about her father's neck, exclaiming:

"If papa, mamma, and Anna, were to go too—not otherwise!"

Anna was silent, but she flashed a strange glance at the questioner, while her mother answered, laughing:

"A single ball-costume for the child, and a dress for me, would cost more than the father's half-year's salary!"

The father nodded, in the midst of his dense clouds of smoke, and congratulated his children that they were not obliged to scorch their feet in the outside Sahara.

Woldemar had scarcely been able to conceal his first surprised impression of the daughters of the parsonage. Only a temporary caprice had decided him to ask from a distant cousin, whom he had visited at Prague the previous autumn, a letter of introduction to the pastor's wife at Grünheim, of whose former beauty that old gentleman had discoursed with real enthusiasm. It was Elfrieda who first fluttered out to him in the garden, like a little, shy bird, and led him in his search for her father. When Anna appeared upon the parlor threshold, the guest was already domesticated in the little family-circle—the letter of their dear, though distant kinsman having insured him the most cordial welcome.

Anna had just returned from a visit to Langenau. As she entered, in her light summer dress, somewhat flushed from her long walk, with a great straw hat upon her arm, and two poppies stuck negligently in her black hair, Woldemar arose, almost abashed at her appearance. She looked full in his eyes for a moment, while her mother uttered the few introductory phrases, then she gave him her hand coolly and quietly; but a momentary pallor chased the glow from her cheeks as she seated herself near him, taking little part in the conversation.

Afterward, the young artist sketched Anna in the most various attitudes and costumes—sometimes as a Spanish, again as a Greek maiden; now as an Italian fisher-girl, or a beautiful mendicant. He never tired of studying and copying her classic lineaments, and taking views of her head from all sides, and in every sort of adornment, until he at last exclaimed, almost in despair, that nothing but a crown, or a wreath of full-blown roses, would do for such a profile.

He never drew Elfrieda.

"She belongs to the wood-and-flower sprites, elves, and such-like merry servitors," he said, sportively, "who can only be caught at the appointed hour, or by close watching."

Perhaps Elfrieda would never have sat to him, for she declared the patience of her sister, who could sit motionless in one position with the air of a queen, to be something quite supernatural. But she could look on for hours, while her new cousin sketched or painted, and no one in the house more admired his work than she. She sought out eagerly for him the finest groups of trees, studied colors and tints under his tuition, learning "to see," as her cousin called it, and often astonishing him by her discriminating criticism of a striking light, or a beautiful object.

"Don't you think our new cousin like papa?" Elfrieda hesitatingly asked her sister one evening.

"Like papa!" said Anna, astonished. "What ails you? What are you thinking of?"

Elfrieda turned away her face, reddening hotly under the strangely-searching look of her sister.

"But I thought their eyes were alike, and their voices."

"To be sure, if black and light-gray eyes are alike, and a tenor can be changed into a bass voice!"

And Anna's hand smoothed her sister's hair, but her grave, earnest glance sought again and again the eyes of her sister.

Another time—Woldemar had already been several weeks at the parsonage—it chanced that the two sisters were walking up and down the garden-path, while the painter sketched in the wood. All at once Elfrieda stood still, and, laying her little hand upon Anna's arm, said, very earnestly:

"I want to ask you something."

Anna's beautiful face grew pale; she hesitated a moment, and replied, in a low tone:

"Speak, then. What is it? Only no long introduction."

She withdrew herself almost harshly from Elfrieda's touch, and, sitting down upon the nearest bench, repeated impatiently, "What is it?"

"How strange you are! It is nothing bad. I only wanted to beg you to be a little more kind to our cousin."

A charming smile parted Anna's lips. With a quick gesture she drew her sister toward her.

"Foolish child! No such solemn preparation was necessary for that. You frightened me."

"You were solemn, not I!" cried the young girl, embracing her sister. "But I see more plainly every day that you cannot endure him, and he is so lonely, and the ladies whom he knows seem not to have been good to him, and in the life he leads his soul will surely be lost, and we are here to save lost souls by goodness and love, and—"

"They were not good to him, Elfrieda? Was he good to them? Has he not told you about it?"

"No, but he thinks that love and truth have vanished from the earth, and nothing seems of worth to him any more. He will marry the first rich lady and be happy after his fashion, like all his friends. But, Anna, there are words that may guide the lost, and we ought not to let him go astray."

"Meanwhile, don't give yourself too much trouble about him. Our cousin is a man like those described in the books he brought us—he thinks that every girl who looks at him kindly is in love with him. Have you forgotten how he spoke of women?"

"Ah, if you would only talk confidentially with him, you would not think so. It makes me so sad, because he has no one who belongs to him, and I have decided to go often with him into the forest, that he may feel less how bad it is to be alone. Are you not at all interested, then, for lost souls?"

"Certainly I am; but I should try to save *such* a lost soul only when it asked me itself."

This conversation made Elfrieda oftener accompany her cousin in his rambles, while Anna grew more silent and reserved toward him than before. Only, sometimes, when Elfrieda was with her mother at Langenau, Anna would remain sitting near him in the garden with some light work in her hand. Then often, very often, he would raise his dark eyes to her, sitting there in her bright dress, with the coronal of black braids on her forehead, like a stranger-queen. A dream seemed resting on his eyelids—he felt as if cast away upon some unfamiliar shore. All the images of the world in which he had dwelt before vanished like shimmering mist. As he compared this young creature

before him with all those women who crowded the brilliant saloons, he seemed to be living in a fairy-tale. All those decorated forms, floating in clouds of gauze, or enveloped in heavy folds of shining silk—how faded, how superficial, would they seem here in this little garden beside this strangely-beautiful being, who grew only more fresh and lovely in the brightest sunshine! Then a word or glance of deeper meaning flew to and fro, and the maiden's *hauteur* almost disappeared as she spoke of her quiet life, and how she longed to know more of people and countries.

He talked very differently with Elfrieda. She was still almost a child, curious as a nightingale—she had so much to ask of the minute details of his life outside, and yet she declared that she could never be willing to leave Grünheim.

"I should like, just once, to take you both to a ball," said the young painter, one day to Elfrieda. "It would be delightful to watch the stir and stare which the appearance of such a pair of sisters would excite."

"What could we do among all those elegant dancers you have told us about?" she answered, musingly. "We should play as sorry a rôle there as poor Frederika in Strasbourg. The ball-costume of the city would become us very ill."

"Not you! You should always wear white, little Elfie. But Anna is, doubtless, more beautiful in rich stuffs and heavy folds."

"Why have you never married any of these charming women whom you know by the dozen?"

"I have waited for beauty—that true beauty which intoxicates my artist-eyes—and for love, to make me a better man."

As the sisters sat alone that evening in their little chamber, and Anna took the pins from her hair, letting it fall in heavy waves upon her proud shoulders, Elfrieda suddenly placed the lamp on a side-table, so that it shone full upon the face and figure of her sister. Anna moved backward, looking at her inquiringly.

"What now, little one?"

"I wanted to imagine how you would really look if you were splendidly dressed with flowers in your hair. I think, as our cousin does, that you would be lovelier than all the others."

"Nonsense! Take away the light, you silly child!" And Anna turned hastily, but not before Elfrieda had seen a vivid flush of anger overspread her face.

Sometimes it happened that Woldemar read aloud for an hour when the pastor was absent. He chose no books from the clergyman's shelves—he had brought with him all sorts of tales, novels, and romances, a whole library of his darlings, the exotics of modern literature—French translations, too, sweet foreign fruits, whose juices, as he himself said, jestingly, would "quickly steal away the senses."

The girls listened with glowing cheeks to every word, but their mother did not conceal her impatience at the "absurd stuff," and, at last, positively declared that it gave her a headache, and could not be healthful for anybody. Schiller, Goethe, and even Jean Paul himself, had never so distracted her children as these complicated love-stories of their cousin, where people behaved so wildly about each other, and yet never married.

"I don't understand the love in such books," she said, "and never shall; and I hope my children will never understand it either. In my time a girl loved with her whole heart, but she made no such ado about it. That her lover would be true was taken as a matter of course, but, if it ever happened otherwise, she married some one else, and made, notwithstanding, a thrifty housewife, who served her husband faithfully, and was a brave mother to her children. Not that the first love was forgotten, but she did not cry out her sorrow to the whole world—she kept it with her prayer for the silence of her chamber. Then she had her hands full, and no time for musing. And she was doubly attentive and devoted to her husband, to make amends for not having given him her fresh, first love. So it was then; but, in these new-fangled stories, the women are no longer faithful to any one, neither to the old sweetheart nor to the new, and they wish to make life agreeable to themselves and to nobody else. Each can love but one—herself. And nobody knew anything about lost souls and such-like things when I was young; it is as if there should be all at once a host of new diseases, of which nobody ever had a symptom before. Children used to do what was approved by their parents, who knew best, of course; but, if a girl could not quite force her heart, she became, with a good grace, an old maid, whom everybody liked to have about, because she helped everybody."

"But, dear aunt," laughed Woldemar, "our modern ladies are willing enough to throw over a friend or a lover and take up with another, provided the one is poor and the other rich. They are touchingly self-sacrificing, too, only in a different way. But one thing they have forgotten, to keep their emotions under lock and key, or, at least, their locks and keys are of very light workmanship compared with—"

"Not all, I hope!" exclaimed Anna, proudly, and her eyes flashed upon the speaker.

She sat at the open window, in the full glow of sunset. The vine-branches had been pushed aside, disclosing an unobstructed view of the garden. Her head was leaning upon her arm, and the wonderfully pure outline of her profile was cut clearly and sharply against the illuminated background. Her summer-dress floated like a light cloud about the perfect *contour* of her shoulders, and her queenly neck was almost swept by the low knots of her black hair. Her eyes flamed, her cheeks glowed, her full lips trembled with her restless breath.

Woldemar had never seen her so beautiful before. A glowing thrill shot through his heart, and he could not take his eyes from her face.

"This comes of those foolish books," said the mother. "The children are growing headstrong.—Anna, go into the wash-room and put away the two baskets of fresh table-linen which I left there, and see that the edges lie evenly upon each other."

Anna rose. She passed her hand across her forehead, and was once more the careful house-maiden.

"You are right, mother. Such reading is not good for us," she said, and left the room with her usual quiet manner.

"I will shut the bad books now," said Woldemar. "They are, indeed, little suited to this place. It is time to go to meet your father, Elfrieda—the christening-feast must be over.—Will you go, too?"

But Elfrieda said that she must help her sister, and the pastor's wife went alone with her guest.

Elfrieda looked after them a while, and then turned backward to the house. She sat down on the low door-stone—it was so cool and solitary, and she felt suddenly tired and sad. The servant-maid was busy in the yard, and through the open door could be seen the garden-path and the forest-road to Langenau.

"How long it is since I have been there!" she thought.

The old house-clock ticked slowly, and very softly, as if from afar.

Anna sung:

"He bade her adieu, as he rode amain,
And the maiden's heart it brake in twain!"

Still Elfrieda sat, with her hands crossed upon her knee, her head resting against the casement, her eyes half-closed, while all sorts of thoughts chased each other through her little head, circling in a roundelay about two central figures.

Why was Walter Heimburg so cool to her cousin? Why could his dear old mamma never endure to hear any one speak of Woldemar? As if one must not care all the more for him if nobody else did! If only in spite of them all! Why did Walter come so seldom now that Woldemar was there, and why did he never stop to talk with her now when he met her on her walks? And never one word of thanks had he said for that great bouquet of the loveliest wild-flowers which she had lately sent to his mother! Her father went often as ever to Langenau; he used always to ask her to go, too—but why did he never speak of it now? All this had never impressed her so strongly as now, when she sat so lonely, and looked out over the road winding, like a narrow ribbon, through the many-colored forest. Who could have time to think of such things when her cousin was by? But the day after to-morrow she would go to the service at Langenau—just out of curiosity—and Woldemar should go, too, and she would see if the minister—

"Oh, I beg your pardon, Fräulein Elfrieda," said a low voice, suddenly. "I could not think—I found nobody—I wanted to speak to your father—it is the Offenbarung Johannis."

She sprang up, startled and embarrassed.

"I thought—papa will surely be home directly—my cousin has already gone for him," she stammered. "Will you wait in the parlor? Anna is there—mamma went out with Woldemar."

A slight shadow flitted across the young minister's face.

"Thank you," he said. "I should not wish to trouble you. My mother sent you greeting."

"We are coming to Langenau day after to-morrow—all of us.

The Vicar of Grünheim is to preach for papa. I am so glad that he can rest for once. What are you going to preach about?" she asked, while he followed her slowly up the steps and entered the parlor behind her.

"About *love*," he answered, softly. "It is a wonderful word; 'though I speak with the tongues of men and of angels, and have not love, I am become as sounding brass or a tinkling cymbal.'"

"We are coming," she repeated, as if in a dream.

He reached his hand to her.

"I will go and carry the pleasant news to my mother," he said, earnestly. "Good-night, Fräulein Elfrieda. Greet your father for me. I will come another time. Perhaps I may meet him."

It was the first time that he had held her hand so long in his own. A strange disquiet possessed her. She drew away her trembling fingers, almost as if frightened, and, opening the door, accompanied her visitor down the garden-path.

Her eyes hastily scanned his face as he bowed his farewell. His light-brown hair was touched with a golden shimmer, but she could not discern the expression of his eyes. He stood with his back to the sunset.

"Many greetings to your mother," he said, and turned away.

She stood gazing after him, but he did not look back; then she slipped back to her quiet nook. Mechanically she repeated the words:

"'Though I speak with the tongues of men and of angels, and have not love, I am become as sounding brass or a tinkling cymbal.'"

Nobody heard her. Nobody saw tear after tear gather slowly under her drooping lashes. Why did she weep? She scarcely knew herself.

The minister's wife sat, with her two daughters, in the neat little church at Langenau, next Sunday. Woldemar had remained at home with the old clergyman. A face like that of the beloved disciple looked down with gentle eyes from the pulpit upon the congregation, and a mild voice spoke with persuasive eloquence of the "highest in heaven and earth"—of love.

He spoke of that love which accomplishes the one greatest miracle ever done on earth, the salvation of lost souls from destruction—of that love, which, as the saintly Thomas à Kempis so nobly says, is "quick, sincere, innocent, kind, dispensing joy, strong, patient, faithful, brave, long-suffering, firm, never seeking its own."

When they rested a while in the parsonage, before their homeward walk, chatting with their cheery hostess, whose eyes had not forgotten the merry light of eighteen years, and the young minister cut a spray of roses for Elfrieda—for Langenau garden boasted such roses as blossomed nowhere else—the fair girl would gladly have stayed the whole day. But Anna called aloud to her:

"Do not forget that you promised our cousin to help him arrange his sketches."

Why did Elfrieda blush as she looked up at the words, and met the deeply-earnest glance of the minister? A half-defiant expression hovered about her lovely mouth, as she rose hastily, saying:

"You are right. We must go, indeed."

So they separated, and a whole week passed without another meeting.

Woldemar Wellen soon came to recognize himself as the central figure of the simple, familiar life at Grünheim, and prolonged his stay from week to week. The whole course of this quiet existence was so novel and interesting that, to his own astonishment, he experienced no desire for worldly excitements. So pleasant was the rest from all those emotions which had been wont to thrill his heart, the conflicting tremors of a passion of a few days' or hours' duration, that he sought to hold fast his new freedom. His so-called cousins were beautiful and naive enough to make him forget all other women, at least for a time. Yet he was almost frightened at the influence of Anna's haughty nature upon him. He found himself taking real trouble to call the sunshine of a kind look or smile to that peerless face.

He did not lack employment. The old minister loved his glass of wine, and Walter Heimburg—if Elfrieda were not near—was an excellent hand at chess. The pastor's wife exercised a genuine motherly care over him, and Woldemar Wellen had nowhere else been so worthy to be loved as in the forest parsonage. He meant to grow better in this atmosphere of peace, and often said in jest that, if his good genius had but led him earlier to New Sesenheim, he should, doubtless, have become a minister.

"It is too late now for piety," he would sigh. "I cannot long do without the great, restless world. I am used to the sweet poison, like the arsenic-eater or opium-smoker, who would pine away and die, if he gave up his dangerous habit. Only a woman who loved me, and whom I loved, could save me now!"

He was still, as he had been, a child of the world, outwardly attractive, petted by women, swayed by circumstances, carelessly enjoying the present moment. He had long ago learned to love but one besides himself—his Art; and even her, not with the sacred devotion of genius, but with the grateful homage of talent, knowing only too well that he owed to her that *dolce far niente* which he called life, and that she alone opened to him the doors of those saloons and boudoirs in which he took such keen delight. And, with the same air of pleasant nonchalance which he wore when chatting with Frau von L— of music, fashion, and love, in her charming boudoir, he now sat with the pastor's daughters: only that here he really tried to be amiable; and *there*, all trouble seemed quite *de trop* to an invariable conqueror.

It was strange that, from the first, the two parents had looked without anxiety upon the association of their daughters with the new cousin. If ever the mother, with the keen glance of her sex, spoke in half-playful warning of the painter's fiery eyes, the father laughed away every budding apprehension with the words:

"How could our children fall in love with such a man of the world? You women see all sorts of tempest-clouds when the sky is blue and clear, but, if a real thunder-storm is brewing, you would make us believe it is nothing. That is your way."

After Woldemar's first return to M—, Elfrieda corresponded with him, and his piquant letters were common property in the family-circle. Anna never wrote to him.

"You can do such things better than I," she would reply to her sister's monitions; "and, besides, does he ever ask for a letter from me?"

She was the last to welcome him when he came again, but she wore that blue dress whose color, he had once said, became her so exquisitely that he should like always to see her in blue—she reminded him of Murillo's Madonna of Seville. She sung his favorite songs, but her demeanor toward him was no less reserved and repellent than before. It was clear—Elfrieda marked it with growing sorrow—that Anna could not abide her cousin. But why not? Walter Heimburg, too, had withdrawn himself more and more, and, if they ever met, he was so stiff and strange that Elfrieda was almost angry, and she was never so attentive to her cousin as during the visits of Frau Heimburg and her son at Grünheim. But when they had once formally taken leave, she felt as if she must run after them, and beg them to come back, and every thing should be very—oh, so very different. Sometimes she really did follow the old lady, and seize her hand caressingly, but nothing came right again, and the cloud still rested on her young friend's brow.

Once only, Elfrieda spoke with the minister of her cousin. As they were walking homeward from a visit to Langenau, shortly before Woldemar's second arrival, she found herself behind all the others at Walter's side, and he suddenly asked her if she kept up an industrious correspondence with her cousin. She was strangely glad to answer:

"He writes but seldom—he has so little time. Young and old lay claim to him, from all quarters, day after day."

"I can easily think so," said the young pastor; "the world holds its children fast, and gives them a wearisome life. I can understand an existence so wonderful that the soul is lost as if while dreaming."

"Lost! What do you mean by that?"

"To be unfitted for a freer, nobler, more beautiful life—gradually to grow sick and sorrowful, to stay in darkness, because the eyes of the soul can no longer bear the true light; to be poor, weary, and forsaken—that is what I call being lost."

"And can Woldemar be lost in that way?" She spoke eagerly, and looking full upon him.

"He, too, unless he be saved by the hand of that one angel, who still visibly walks the earth—the hand of Love."

"Could the love of a woman really save a man's soul?"

"It does so, a thousand times, and thus fulfils its highest mission."

"The highest?"

"In the Christian sense, at least—not in the worldly. In the

worldly sense, a woman wishes by her love to make happy, and to be happy; but, in the higher sense, she sacrifices herself to save another. She is then a martyr of that love of which Thomas à Kempis says, that it purifies the heart of all selfish desires, makes it whole within, strong in patience, and steadfast in hope. Not the old Christians alone numbered their martyrs—in *our* days they still walk upon the earth."

"Do you admire such martyrs as you do *those*?"

"Sometimes even *more*," was the answer.

"But to be happy, and to be happy, is surely the more beautiful," said Elfrieda, hesitatingly.

"I think so, too," said her companion, with a smile; "but women are never so dazzled by any worldly ornament as by an aureole. They think *that* more becoming than the rose-garland of happiness."

"And what do you think?" asked the young girl, a roguish smile flitting over her sweet face. But, before he could reply, they had reached the edge of the forest, where the others awaited their coming.

After this conversation, Elfrieda seemed often absent-minded and perplexed, and, in her next letter to her cousin, she wrote on a separate slip of paper the question, which of the women of the Bible he most admired.

The artist's answer made the young girl so angry that she tore the letter in a thousand pieces. It ran:

"I will confess the exact truth, without fearing the displeasure of my sweetest little cousin, that I prefer, to all the well-known holy women, that one—called a sinner, the fairest of the fair—Mary Magdalene. Fortunately, Correggio was of the same opinion, and Correggio passed for a very pious man."

It was clear as sunlight that Cousin Woldemar belonged to the totally lost souls, and must be saved. What would her father have thought?

"Why do you not read us your cousin's letter?" asked the mother that evening, as they sat together in the parlor.

"Because such scribbling is best burned up, and that is what I have done with it."

Her father raised his mild eyes from his paper, the mother let fall her knitting.

"You have burned Woldemar's letter! Why in the world—?"

"Because he talked such absurd and foolish stuff," and Elfrieda smoothed her hair nervously in remembrance of Mary Magdalene.

"If that is so, you ought not to write to him any more," said her father, quietly.

"Oh, no, papa! It is not so bad as that!" she answered, in embarrassment; "but he has been teasing me. He is not a bit good, and I meant so well toward him, and—indeed, I *must* write to him, for I am the only one in all his world who ever speaks a good serious word to him."

"Well, let it go, then; but I beg you to show us his letters in future, before you burn them."

"Yes—I will surely not do it again, papa." At this moment Elfrieda's eyes fell upon her sister, whose face was turned fully toward her. Anna's always busy hands were still, a cloud rested on her brow, and Elfrieda caught a look of searching anxiety and trouble. The young girl involuntarily stepped forward, asking hurriedly, "Are you angry with me, Anna?"

A quick flush overspread the beautiful face, and Anna pushed away Elfrieda's outstretched hand.

"Let us have done with this endless questioning. I was not thinking of you!"

She rose and left the room; but, entering a little while afterward, her face was calm as ever, and she smoothed her young sister's hair as if in token of reconciliation, meeting her eyes with a smile so tender that Elfrieda assured herself that only her own emotion had made the shadow of sorrow and care mount to *this* brow.

After this, Elfrieda wrote more seldom to Woldemar, but she began to keep a *diary*, like all the young girls in the magazine-stories. To Anna's astonishment, she often sat for a long time at night, in the attitude of a thoughtful muse, with her pen in her hand, before the unwritten leaves, and, after her most intense meditation, not a single page would be filled. She had so little variety of daily experience, and it was really frightful to see how absurd those fancies seemed, when written down, which had been so fascinating as they floated through her brain. So it happened that Elfrieda often tore out a leaf from her diary, and always locked it carefully, in terror, lest Anna, or

the mamma at Langenau, might some time cast a glance into it. She knew, too, how cheaply her old friend estimated such girlish records, calling them the best medium for cheating and deceiving one's self courteously. And he, Walter Heimburg himself—she could imagine his astonished smile, if he were to look into the mysterious book. This thought drove the blood to her cheeks. At all events, his name should not appear in it. He did not trouble himself about her, neither would she for him. And, indeed, she had nothing to write of him, for she scarcely saw him any more; and that she was sad, very sad about it, that she would never set down in plain letters—even her own eyes should not read that!

Cousin Woldemar, on the contrary, furnished inexhaustible material for the diary. Since he had come back, and the forest-rambles were begun anew, there was no more trouble about empty pages. How often Anna looked for a moment over her shoulder, and then, taking the inkstand away, sent the little journalist to bed. Why did a sight of the diary always make Anna so impatient? Could she not endure even the *written* name of her cousin? For, surely, she must know that it was written there.

"Get a diary for yourself," said Elfrieda. "It is really very profitable, and I understand, now, why the book-ladies so revel in diaries. One first learns to know one's self thoroughly by the aid of such a mirror."

"Do you think so? I am afraid that your real face will never look out of *this* mirror," laughed Anna.

Elfrieda was more dissatisfied with her cousin than ever. He gave her no opportunity for that serious conversation from which she hoped so much for his salvation, and had that way, which always vexed her so much, of turning aside the most earnest questions with a jest. Then, too, he seemed often restless and preoccupied, or sad and dejected. The diary had but one explanation of such conduct—he was in love. But with whom? Some lady of the outside world? Very unlikely. He could not love Anna, who visibly avoided him, and was colder and more repellent than ever; and the diary was firmly convinced that the unhappy young man must be pining for little Elfrieda. The most interesting thing in the real world, or in books, had transpired—a passion unreturned, a manly heart glowing with secret devotion, and a maiden with a hand full of compassion. It was a pleasant and profitable diversion, amid all her secret trouble at the coldness of her Langenau friends, to fill pages about the willing self-sacrifice of a woman's heart.

Meeting Frau Heimburg unexpectedly one day, she could not help falling upon her neck for very joy; but the old lady received the strange greeting icily, and asked her how she came to be wandering about by herself.

"With whom should I go?" said the young girl, in confusion. "The others have no time."

"The others? Not your future bridegroom?"

A hot glow shot over Elfrieda's face—she could not utter a syllable, and was scarcely able to refrain from bitter weeping.

Fortunately, Walter Heimburg came up with her father, and she could slip away, unnoticed, and weep in silence. She wished to detail all this minutely in her diary, but not a word of it could she force from her pen that night. So she told herself, instead, how busy Woldemar had been that afternoon, that he soon would be going away again, and that she dreaded the winter, and did not care to think of Christmas at all.

The time of Woldemar's departure was at hand, and the artist begged Elfrieda to go with him once more into the forest. The day was strangely beautiful—that enchanting blending of summer and autumn, of sunshine and blue atmosphere, and the forest stood robed in all the brilliant dyes of the season. But Woldemar seemed to have no eyes for all this glory. He threw his portfolio upon the grass, and, reclining under an old beech-tree, he said:

"Sit down opposite me, in the clear light, Elfrieda. Play at forest-queen once more, and let us talk. I have much—much in my heart. How long it will be before we shall see each other again! Who knows what may happen? And to-day I would gladly tell every thing—ask—confess—"

The young girl sat down. The sunlight played upon her hair through the tremulous, translucent roof of leaves. She seemed strange to herself—half-anxious, half-curious—she thought of her diary. Was it coming now—the noblest experience of a woman's life—a real declaration of love?

"Is your soul so burdened?" she asked, softly, with downcast eyes.

Perhaps he would himself turn the conversation to Mary Magdalene, and then she could chide him soundly by way of supplement.

"Oh, no! Not my *soul*—only my *heart*," was the answer. "Who can tell how we shall meet again? I am standing now at a cross-way, and am as fearful to go forward as a child in the dark."

"How can we meet other than as we part? You will find me unchanged when you come back."

He raised his eyes and looked long at her. She had spoken warmly. How beautiful she was at that moment! How delicate and *spirituelle* the small head! How lovely the drooping eyelashes! How charming the rosy mouth and glowing cheeks! A thought flashed through his brain. Was it possible that this bright creature loved him?

And, as Woldemar Wellen was a man, he answered his own question with, "It cannot be otherwise!" He stretched his hand to the young girl.

"Will you really be kind to me when I come back, Elfrieda? Will you keep just a little sunshine for me? I need it more than any one else, I think."

"How strangely you speak, Woldemar! I have so much time to think about you, and to be glad that you are coming—"

"And no one else will be glad, I know. For Anna—"

"What of Anna?"

The young man sat a moment in silence, with compressed lips.

"No, she is the coldest being in all the world," he murmured. "She will never think of me, never speak of me. She will marry some prince, and the whole world will admire her."

Elfrieda burst into a merry laugh.

"Cousin, you are dreaming! Would a prince ever wander here? That only happens in the stories. Anna never has thought of such things—it is only I who, when a child, was always seeing myself a duchess. But even with me that is long gone by, and Anna was always too sensible for such fancies, though she would have liked for once to look beyond the mountains. And because my sister does not like you, dear cousin, you must not think ill of her. Anna was always a very pious girl, and you know, dear cousin, with your soul—"

She looked expectantly at her *vis-à-vis*. He could not escape her. She had come at last to her darling theme. Gloomy and silent, he sat staring at her. Her heart smote her in pity. She arose, knelt down beside him, laying her little finger-tips softly on his shoulder, and said, gently:

"Do not be too sorrowful, Woldemar. Perhaps a hand will yet come to save you and make you happy again."

"It is well that other women are not like you, Elfrieda," he said, with a melancholy smile. "We men of the world should begin to love in the old idyllic fashion—and that would be sad, indeed, drawing in its train general financial disorder and the gravest revolutions of state."

She raised her eyes, and gazed at him like some startled wild creature. Was the declaration coming now? She suddenly wished herself a hundred miles away.

"Fie! How frivolously you are talking again, just as in your letter about the 'Magdalene!'" she said, uneasily. "The only salvation of all sick and perplexed souls grows out of true love, and you—"

"Yes, love were my only salvation, but love which should come to me fully and freely. It is very likely that all might go well with me yet if I were loved as I love. But that is over with—nobody loves me. Is not that sad, and at the same time ridiculous?"

Was this the decisive moment? Should she say to him now, "I will save and—love you?"

An icy flood seemed closing round her heart. For the world she could not have opened her lips. And yonder, in the thicket, did not the pale face of the pastor of Langenau arise, and gaze at her with sad, reproachful eyes?

She arose in haste.

"Come, we must go home. Mother will be waiting coffee."

He obeyed silently. The confession was unmade. They walked quietly side by side. Mechanically Woldemar stooped to pluck here and there a late wild-flower or a little autumn-painted twig.

But Elfrieda had forgotten, this time, her wonted occupation. Never had so many conflicting emotions filled her heart. An intense longing possessed her for the gentle eyes of the dear old mother of

the Langenau parsonage. How often she had told her all her girlish fancies, her foolish dreams, and, when the confession was ended, the soft hand was laid upon her forehead, and the mild lips whispered, "Darling child!" Only once more to hear those words! She seemed to herself so old and helpless she could have wept aloud for herself and for that foolish Woldemar, who cared more to be loved than saved.

At the edge of the wood the painter stood still.

"It is a poor sorry, little nosegay that I have gathered, Elfrieda," he said; "poor and sorry as my own heart; yet take it from me, in memory of this strange hour when I would have said so much to you, and said nothing. I lack the courage to leave, and yet I know that I cannot stay, because no one will say to me 'Stay!'"

She took the flowers mechanically, but her hand trembled and her face was pale.

"I am very, very sorry, for your sake," she answered, softly, after a pause, with downcast eyes, "more I cannot say."

The artist's eyes rested admiringly upon the sweet, girlish face. Poor little one! There was no doubt of it—she loved him! He felt a momentary blending of gratitude and triumph.

"Keep this sweet pity for me," he entreated, involuntarily encircling with his arm the delicate form.

One moment her head sunk upon his shoulder, her curling hair swept his cheek.

"Pity? Oh, yes, much—much pity!" she breathed; then she tore herself away, and hurried toward the house.

It was already dusk when Woldemar returned to the parsonage. He paused in the grape-arbor to look in for the last time upon the little illuminated paradise which he must leave before daybreak tomorrow.

How peaceful was the scene! The lamp-light fell on the pastor's white hair and on his faithful wife's sweet face, framed in her snowy cap. Elfrieda sat, as usual, beside her father on the sofa. One slender hand lay on his shoulder, but her bent head leaned against the wall; her face, half-turned away, wore a pained expression; and her eyes were closed, as if she feared to let the thoughts be read which stirred her heart.

"Poor little one!" thought Woldemar.

Anna sat in the full light, her hands nervously busy with her work, but now and then she raised her head and looked with a restless, dreamy expression toward the door. But when Woldemar entered she did not look up, but her fair head bent lower over her work. The old, familiar tone was gone to-night from the Grünheim parsonage. Elfrieda, always so gay, was silent. The Heimbürgs, who had been expected, did not come. Anna sung but little; her voice seemed veiled, and yet Woldemar thought it had never been sweeter. But when, at his request, she ended with the song—

"To-morrow my love will leave me,
My love so gallant and bold—
The birds in the wood are singing,
With voices manifold!"—

no one seemed able to speak again. The old pastor admonished them of the hour for rest, and thus they parted, for the young painter would leave before dawn without disturbing any one. How heart-felt were the parents' parting words! But it was strange that he only took Anna's hand in silence, and pressed it to his lips. How pale the beautiful girl grew at that moment! Elfrieda was almost frightened. Doubtless Anna repented having been so unkind to her cousin. What a pity that it was now all too late!

"I shall write soon," he whispered to Elfrieda, as he pressed her little hand.

Woldemar Wellen left his New Sesenheim before daybreak, in order to reach the nearest station in time. As he went slowly along the dark path, while the servant strode on before with his luggage, he felt a sudden, soft touch on his arm, and, as he turned, warm fingers pressed a rose into his hand, and a voice, choked with tears, whispered, "Farewell!"

Who spoke this word?

Before he could recover himself, the figure, whose outlines he could not distinguish, had vanished in the door-way, and only the sweet perfume of the flower assured him that he had not dreamed.

It was Elfrieda—poor child!

Eight days had passed since her cousin's departure before Elfrieda received his first letter. She had awaited it with strange anx-

iety. How many times had she gone to meet the letter-carrier on the road to Langenau! How would it sound, this first letter, after the scene in the forest, which she could not yet remember without heart-throbs? What could he confess to her, but the one thing—that he loved her, and that she must save him? But the thought of this "saving," which seemed so easy a little while ago, grew harder and harder, till it lay like a stone upon her young heart. Again and again she had knocked at the door of the Langenau parsonage, firmly resolved to confess to her dear old friend all her fear, her folly, and unrest; but, when she met the clear, gentle eyes, no words came to her lips. What would Walter think of her, to whom she had once said, in her self-exaltation, that she would gladly save a soul by the sacrifice of herself? It seemed to her that his glance often sought her with strange searching, and she felt the hot blood mount to her cheeks as she was reminded of her father's look, when as a child she had tried to hide any thing from him.

The letter came, and she held it fast in her trembling hands, gazing at seal and superscription as if both were strange to her.

At last she tore open the envelope and read:

"You will expect a full explanation, Elfrieda, and yet I feel I can confess only one thing: I can and will live no longer as I am. Since I am thrust out of paradise, for your atmosphere—I know it now—had become to me the air of paradise, I must help myself as best I can. The love for which I longed will never be for me, and so I have concluded, not to shoot myself, but to marry. In a week more, if no sweet voice recall me, I shall lay my life at the feet of a lady who thinks she loves me, and shall be neither happier nor unhappier than a thousand others. Do not give yourself pain about my soul, dear little seeress of the wilderness, for it is and will be irrevocably lost away from—New Sesenheim.

"WOLDEMAR."

Anna was standing at the window of her chamber when Elfrieda rushed in upon her with Woldemar's letter still in her hand. Her face was hot with blushes, and bathed in tears. She trembled, and embraced her sister with passionate affection.

"He has had a call away from Langenau—far, far away, papa says—and he is going to accept it, and Woldemar has written—only read it, Anna, I beg of you! He will be lost—he will do himself wrong, and marry a lady whom he does not love. He *must* be saved, and I—O God! I cannot do it now or ever if they go away from Langenau!"

In the midst of her confused utterances she pressed Woldemar's letter into Anna's hand.

"You cannot save him—you, Elfrieda?" asked Anna, pale and almost voiceless. "And yet you love him?"

"No, no, a thousand times no! I should be wretched, and he, too. I thought it very easy to be a martyr, but I am only a silly, selfish creature. He is right to go away and forget me!"

"He? Compose yourself, Elfrieda. Who?"

"Walter Heimbürg! I shall die if he leaves me alone."

A sudden light illuminated Anna's face. She bent down and kissed her sister again and again.

"Be comforted, poor child," she said, tenderly, with a radiant smile. "He shall be saved, and, if you will not do it, why, then, I must."

"You? O Heaven! you might have done it, but you have hated him so—"

"Because, at first, I was afraid to love a man who thought so ill of women, and afterward because I thought *you* loved him."

"And *that* was the reason you were so hard toward him? O God! how strange it all is! If I only knew how he—"

"I was harder to myself than to him. And I knew that he loved me, for, before he went away the last time, he wrote to me. I left his letter unanswered for your sake. Do you understand it all now, little Elfrieda?"

A few hours later Elfrieda sat at the feet of her motherly friend, and had no wish more. A letter had just been dispatched, refusing the call to L—. Walter Heimbürg would remain at Langenau. The old dame's hand lay on the young girl's fair brow, and her lips uttered, between smiles and tears, the words Elfrieda had so longed to hear, "My darling child!"

And somebody else was there, who held the little warm hand

fast, and as Elfrieda, radiant with bliss, looked into his eyes, she wondered at two things—that Walter Heimbürg looked so remarkably like papa, and that mere human happiness could be so sweet.

Meanwhile, another letter was flying over hill and valley to a lonely one. It contained only the words: "Come, Woldemar, to thine Anna."

He came? And were there in all the world happier mortals than at New Sesenheim and Langenau?

But, on the day of her future mother-in-law's arrival, Elfrieda burned her diary.

MORTON HOUSE.*

BY THE AUTHOR OF "VALERIE ATLMER."

CHAPTER XXVIII.—ON GUARD.

SUDDENLY the ill-matched companions were startled by a terrible uproar in the back yard—the deep, angry growl of a dog was followed by the scampering rush of two animals in a short, mad chase, and then the cries of inarticulate distress, which dumb beasts can occasionally utter in their own behalf, fell painfully on the ear. Mingled with these came a Babel of sound—men shouting, women running, cries, commands, and undistinguishable confusion—in the midst of which a panting little negro rushed to the dining-room door.

"Mistiss, Rollo's caught the calf, and Uncle Jake says as how he's goin' to tar it to pieces!"

"Good Gracious!" cried Mrs. Marks, in consternation. "What did he let the dog catch it for! What will your master say! Tell him to beat him—do any thing to make him let go! I always told Mr. Marks he better not bring that bull-dog here," she added, as the child darted away. "I knew he was sure to do mischief—Goodness! what awful sounds!—Mrs. Annesley, if you'll excuse me, I'll—"

The sentence was not finished, and Mrs. Annesley had no opportunity to reply. The uproar grew worse, and Mrs. Marks followed the example of the rest of the household—she flew to the scene of action.

If the victim of Rollo's unreasoning fury had been a child instead of a calf, it is to be feared that Mrs. Annesley would equally have regarded the episode in the light of a fortunate and providential relief. The instant that the last flutter of Mrs. Marks's dress had vanished down the passage, she opened the door that led out upon the side-piazza, crossed it, and the next moment was walking rapidly down the garden-path.

She was so lightly and delicately shod that her step made very little sound on the smooth gravel, and St. John, who was comfortably smoking his cigar in a sheltered nook—waiting, as Mrs. Annesley had shrewdly suspected, for the departure of the carriage—was completely taken by surprise when, without any warning, this elegant figure stood before him.

Instinctively he took the cigar from his lips, and rose to his feet. This was not Mrs. Marks, but none the less was it somebody much more at home in the garden than he had any right to be. Therefore, the first words that formed on his lips were words of apology for his presence there.

"Excuse me," he said. "I fear I am a trespasser; but I am waiting to see Mrs. Marks."

Mrs. Annesley bowed graciously, and, instead of retreating, swept a step nearer.

"Mrs. Marks is occupied just now," she said, "and I came out to look at the garden. Don't disturb yourself, I beg. I shall not interrupt you. Mr. Marks told me something about a new perennial," added she, glancing round. "Don't let me trouble you, but pray do you chance to know where it is?"

St. John smiled, and replied in the negative.

"I am a stranger," he said, "and this is the first time I have ever ventured to invade Mrs. Marks's garden. I am sorry that I cannot tell you any thing about the perennial."

"You have no idea where it is?"

"I have not the least idea where it is."

Mrs. Annesley gave a little sigh of resignation.

"Such a pity!" she said, and, as she said it, she ran her eye with apparent carelessness, but with really keen attention, over St. John's person.

The result of her observation was discouraging. Despite all that Mrs. Gordon had told her, and despite her own distrust of the man, she could not believe that it would be expedient or even possible to approach him with any overtures of bribery. Adventurer though he was—sharper though he might be—he at least bore all the outward semblance of a gentleman; and, as he stood before her—perfectly self-possessed, notwithstanding the equivocal position which he occupied, and lightly holding his cigar between two fingers as he returned her scrutiny—she felt as much at a loss how to address him as she had before felt at a loss how to reach him. It was hardly wonderful. This man was so different—in every particular so essentially different—from the man her fancy had created, that the discrepancy in itself startled her.

As she hesitated, St. John, on his side, had time for observation and consideration. The perennial excuse had not deceived him. He had seen at a glance that this fine lady—whoever or whatever she might be—had come into the garden to meet himself. At first he had supposed that her motive might have been one of mere curiosity; but, as she still kept her place in front of him, as he felt her keen black eyes reading his face, and, as he saw the doubt unconsciously stamped upon her own face, an instinct of her real purpose came over him.

"There is something she wants to get out of me," he thought. "Well, let her try. It will be strange if in the end I don't succeed in getting considerably more out of *her* than she thinks of or bargains for!"

"Perhaps there is something else I can do for you," he said, as she remained silent for some time.

Mrs. Annesley started a little, and recovered herself.

"There is nothing, thank you," she said. "I won't disturb you any longer. Good-day."

She bowed slightly, and walked away—three steps. Then she paused, and, turning back, spoke again.

"Perhaps there is something I can do for you," she said. "Am I not right in supposing that it has been my presence which has kept you from seeing Mrs. Marks? Shall I be obliging, and take my departure?"

"I could not presume to ask such a thing," answered he, bowing gravely.

"It would not be very much of a presumption," answered Mrs. Annesley, smiling graciously. "A friend of Mrs. Marks—you are a friend of Mrs. Marks, I suppose?"

"I scarcely think it probable that Mrs. Marks would allow me to claim that honor."

Mrs. Annesley arched her eyebrows and looked around the garden. Plainly she meant to say, "Not a friend of Mrs. Marks, and yet here!"

The coolness of the glance amused St. John, and he answered it more on account of this amusement than because there was any absolute necessity for doing so.

"Under these circumstances, you are surprised to see me here?" he said. "But I think that, when I explain the reason of my presence to Mrs. Marks, she will not regard my intrusion as unpardonable."

"I am sure Mrs. Marks is always glad to receive Miss Tresham's friends," said Mrs. Annesley, using the very words which Mrs. Marks herself had used that morning—the words which had encouraged St. John to return and endeavor to learn from her something more than he had been able to glean from her husband. The coincidence struck him, and, together with the unsuspected sound of Katharine's name, made him look sharply at the speaker.

"Excuse me," he said. "I do not understand."

But, as it happened, Mrs. Annesley had grown tired of this aimless fencing; and, besides, she had not time for it. At any moment Mrs. Marks might come in search of her, and the opportunity she had been so anxious to secure would thus be hopelessly lost. Making a rapid calculation for and against success, she decided to close at once with her slippery opponent.

"Excuse me," she said, with a smile. "I fancied that I was speaking to Mr. St. John."

* ENTERED, according to Act of Congress, in the year 1871, by D. APPLETON & Co., in the Office of the Librarian of Congress at Washington.

The smile told St. John infinitely more than the words. There was a shade of malicious meaning in it, which, under the circumstances, was far from wise, but which Mrs. Annesley would have found it hard to control. It was so pleasant to turn the tables on him in this style—so pleasant to show him, in three words, how well she knew every thing about him! But still, it was a blunder. It put St. John on his guard, and it made him set his teeth and think: "Confound the woman! What devilry has she got in her head?" It galled him, too; but he had a very good armory of his own at command, and from it he immediately selected his favorite weapon of covert mockery.

"I am deeply flattered," he said, with a bow. "I had no idea that my name had been fortunate enough to attain any degree of notoriety. I do not think that I have the pleasure of an acquaintance with yourself, madam."

"You have probably never heard of me," said Mrs. Annesley, quietly. "I am a person of no consequence whatever—out of my own family. It has merely chanced that I have heard of you," she went on. "Mrs. Marks is very much attached to Miss Tresham, and, in speaking of her, she mentioned your name to me. I also am a friend of Miss Tresham's," said the mistress of Annesdale, with a virtuous expression of face, "and as such, I am glad to meet you—glad to be able to say a few words to you, if you will allow me to do so."

"I am at your service."

"Let us sit down, then. Since you are kind enough not to consider me impertinent, I should like to be very frank with you. I am generally frank with everybody. Experience has shown me that it is so much the best way."

They sat down. Just behind the short bench from which St. John had risen, was a wall of running ivy; on each side rose tall shrubs, which, although bare, still made a seclusion of the little nook. Regarded from a short distance, the two figures, who had the nook to themselves, might easily have passed for a pair of lovers. Considered, as they actually were, they much more resembled two adroit chess-players, who sat down equally matched to a game in which skill and care could alone determine the result. Mrs. Annesley made the first move—St. John contenting himself with keen watchfulness and attention.

Said the lady: "I must begin what I have to say, by explaining why I say it. I know Miss Tresham quite well, and"—a gulp—"like her very much. You can imagine my surprise, therefore, when I heard from Mrs. Marks that she has left her late home in a very sudden and mysterious manner, and that it is more than doubtful whether she will be received again when she returns."

St. John started. This was certainly news to him. Mrs. Annesley noted the start, and went on:

"I think it right to tell you, Mr. St. John, that the ground on which Miss Tresham will be dismissed from Mrs. Marks's house when she returns, is that of her connection with yourself. Mr. Marks has finally decided that unless a satisfactory explanation of this connection is given, he cannot retain Miss Tresham as a governess. Now, as a friend of Miss Tresham's, will you allow me to ask if it does not occur to you that it is your duty to remove the cloud from Miss Tresham's name by at once making this explanation?"

"You have set me an admirable example of candor, madam," said St. John. "Do not be offended if I follow it, and, imitating your frankness, ask if it does not occur to you that it is quite impossible for you to judge of the affairs of people who are strangers to you?"

"I thought I had explained that Miss Tresham is *not* a stranger to me."

"Evidently she is a stranger so far as regards her confidence, or else you would not need to make this appeal to me."

"You do not intend to heed the appeal, then?"

"Imitating your frankness again, I must decline to answer that question."

"Because I am not personally concerned in the matter?" asked Mrs. Annesley, resolutely resolved to keep her temper under any provocation.

"Yes—because I am unable to perceive that you have any personal interest in the matter."

"Suppose that I assume—that, if necessary, I am willing to prove to you—that I have an interest in the matter, that I have a personal reason for wishing to clear up the mystery around Miss Tresham, will you still refuse to give me the explanation?"

"I regret to say that I am compelled to do so."

"Do you not take Miss Tresham herself into consideration—her character? Do you not appreciate how badly this reticence looks—for her?"

St. John only smiled. Evidently, if it had been courteous to do so, he would have shrugged his shoulders, and said, "What is that to me?" As it was, his face said it for him, and Mrs. Annesley read his face. That instant she shifted her ground.

"I am anxious to obtain certain items of information about Miss Tresham," she said; "items which can harm neither her nor any one else. Do you know any one who, for a liberal reward, would show me how to obtain these?"

She looked steadily at St. John, and St. John returned her gaze without the quiver of an eyelash.

"I do not know any one whom you could employ for such a purpose," he answered.

"No one at all?"

"No one at all."

Mrs. Annesley rose from her seat, and drew her shawl gracefully around her.

"It is growing chilly," she said, "I must go in. I regret to have disturbed you, Mr. St. John. Pray, don't let me disturb you further—pray, don't get up. I suppose it is quite useless to look for that perennial. Good-day."

A bow on both sides, and they separated. The worsted player retired with all the dignity she could summon to her aid; but, as she swept slowly down the garden-walk, she struck one gloved hand angrily against the other.

"I went to work wrong," she thought. "Some way or other, I went to work wrong! The consequence is, that this wretch has completely baffled me, and that I am not an inch nearer to my end than I was before."

As for St. John, the first thing he did, when he was alone, was to relight his cigar, and the second was to indulge in a laugh of properly-subdued tone.

"Oh, these women! these women!" he said to himself. "How is it that the devil teaches them so much cunning, and yet lets them overreach themselves so completely? Well"—with a long puff—"this has certainly been something that I did not bargain for—a little dash of intrigue that I did not expect in coming to look up my respectable friend who asks me to tea. I fancy Mrs. Gordon is not the only person *now* who has discovered the identity of R. G. After this, I can put my hand on the writer of the advertisement and the letters whenever I choose. I have two things yet to find out, however—first, her name; and, secondly, her motive."

A thought struck him. He rose from his seat, walked to the garden-gate, let himself out, and sauntered down the road to where Mrs. Annesley's carriage stood, with Mrs. Annesley's coachman and footman in attendance. Stopping to admire the horses, he easily fell into conversation with the servants, and in five minutes had learned every thing that he wished to know. No human being was ever so fond of boasting as the family-negro of the old *régime*, and Mrs. Annesley's servants were no exception to the general rule. No sooner was it evident that St. John was a stranger, than their tongues were loosed on the glories of Annesdale and of the Annesley family. Mistiss and mistiss's various splendors, Mass Morton, and Mass Morton's horses and dogs, were the favorite topics—the last especially; and St. John, who never forgot any thing, had no difficulty in identifying this much vaunted "Mass Morton" with the Mr. Annesley whom he had met in the grounds of Annesdale. Every thing was so clear to him that he could have laughed to himself as he stood on the sidewalk smoking his cigar, and listening lazily, as John and Peyton by turns descanted on the absorbing subject. It was quite a shock to Mrs. Annesley when she came out and found him there.

"Mr. St. John!" she said, haughtily, and drew back as he came forward with the manifest intention of assisting her into the carriage.

"I have been admiring your horses, Mrs. Annesley," said St. John, smiling. "They do credit to your taste. Will you allow me?"

On second thoughts, she allowed him to put her into the carriage; and, when she was seated, looked up and spoke.

"If you will take my advice, you will consider what I said to you a short time ago. It might be worth your while. I need not tell you where you will find me if you desire to communicate with me."

He bowed—making no other answer to the covert sneer in her last words—and, as he stepped from the door, the carriage drove off.

When it was out of sight, he turned, and, opening the gate, walked up to the house. Mrs. Marks had accompanied Mrs. Annesley to the front piazza, and was still standing there when he approached. In the first sound of her voice, in the first word which she spoke, he saw that a change had come over her—that she had been placed on guard against him. She answered his questions courteously; but there was none of the hearty cordiality of the morning in her manner, and she did not ask him to enter the house. After finding that her ignorance about Katharine was quite as complete as it had been represented, he had no alternative but to take his leave. Before doing so, however, he received a piece of information which startled him a little. He thought that it might be as well to verify on indisputable evidence the facts which the servants had given him, and so he said, carelessly:

"Will you allow me to inquire if the Mrs. Annesley who has just left is related to the young gentleman of the same name whom I saw here a few hours ago?"

"She is his mother," answered Mrs. Marks—adding, involuntarily, "and the cousin of Mrs. Gordon."

"Indeed!" said St. John, starting quickly.

After this, he asked no more questions, but made his apologies, and took his leave almost immediately. As he walked down the street, the few people who met him and looked curiously at him, saw that he was deeply absorbed in thought. In fact, he was revolving what he had just heard, and considering what it meant.

"Mrs. Gordon's cousin," he repeated to himself. "What the deuce is the meaning of it all! Shall I never get to the end of all the strings and counter-strings which seem to be pulling these people to and fro?"

[TO BE CONTINUED.]

JE HORGE.

IT is not well for a man to forsake his country and its characteristic traits. Moreover, when a man does so conduct himself, it is proper, if not a positive duty, for other people to recall him to a sense of what he is, and whence he came. These remarks are intended as an explanation of our addressing Ah Kong, who, though a stipendiary menial, is yet our guide, philosopher, and friend, by the title of Je Horge. Ah Kong has, singularly enough, a desire to be somewhat Americanized. This desire has, as yet, only manifested itself in his head, on which he wears a common felt hat; in his feet, which are now arrayed in the leather boots of our country, instead of in Chinese sandals; and in his change of name, George having been selected by him as a substitute for Ah Kong. As I have said, he Americanizes his name, and, in return, we Chineseify it, the result being that he is generally addressed as Je Horge.

Je Horge is an estimable Celestial. He is making rapid progress in music, combining the accomplishments of the Chinese school with the popular airs of the day. Cosmopolitan in music, as in dress, with a delicate sense of impartiality, he gives each school a fair show—he whistles American airs, and sings the songs of China. This variety is pleasing. Mornings when I write, and he is engaged in washing the windows of the room below, an occupation which the excessive dust of San Francisco renders frequently necessary, I hear "Kaiser, don't you want to buy a Dog," or "Moet and Chandon," whistled actively; and, just as I am becoming weary of the noise, Je Horge leaves off whistling, and sings some charming love-song of home. With Chinese singing in your ears, how can your writing fail to be inspired? Still, even Chinese singing hardly seems striking or novel here in San Francisco, where every street-peddler chants his wares. The strawberry-sellers have more varieties of airs to which they adapt the single word "Strawberries," than there are varieties of that fruit in the market; while there is an orange-vender with a superb voice, who every morning makes the street ring with his song. He begins in a sweet and melancholy strain, "Oh, oranges, sweet orange-e-es!" and there is a tender softness about the air that makes pleasing visions of sun, and trees, and flowers, from tropical climes, float before your eyes, and then, as the last prolonged notes linger plaintively on the ear, he changes to a conversational, but prosaic tone, thoroughly business-like, and remarks, "Four bits a dozen!" Is it fair, O Orange-seller, to

raise us and your golden fruit to such heights of poetic musing, and then suddenly wrench us out of our dream to the cruel bareness of the hard facts of life?

Je Horge's singing does not trouble me now. I have become accustomed to it, and, besides, my visit to the Chinese Theatre has made me listen to it with a feeling approaching gratitude; it might and would be so much worse if Je Horge were accompanied by an orchestra.

Je Horge's conversation is interesting. His accent is perfect in the few words of English which he knows. But, alas! those words are so few—so very few. It always seems to me that Je Horge is leading me unfairly into conversational depths for which I am unfitted. In this way I have grown to regard Je Horge somewhat as Socrates must have been looked upon by young Greeks whom he had previously worsted in argument. But Je Horge is enticing, and to his fascination I succumb. In an evil hour I let him see that I was curious to learn about Chinese life and habits, and since then he has shown me the Chinese elephant to such an extent that I feel at times like a godless Chinese youth of fast proclivities, and fairly expect to find a cue of long black hair springing from my head, and whacking upon my back as I walk the streets. I have visited gambling-houses and Chinese schools with Je Horge, and have marvelled at that national characteristic perseverance which led him on Monday night solemnly to lose his last week's wages, while on Tuesday, with equal immovability, he went through, with great diligence, the story of "Harry and Frank"; or, "Self-Denial," from the pages of the Fourth Reader. By adopting a guarded and non-committal manner with Je Horge, I flattered myself that he could lead me astray no more. Vain hope! When Je Horge pointed to a building ornamented with lanterns, and said, as I understood, that there was Chinese wrestling there, I walked up a flight of stairs with him, and, to my horror, found myself in a Chinese restaurant. It was the first imperfection in Je Horge's pronunciation that I had found, but I was partially consoled for the disappointment I felt in not seeing Chinese wrestlers, by Je Horge's announcement that the play at the theatre was to be particularly good on Saturday night, and I immediately declared that we would go together, so that I might have the benefit of his interpretation of it.

The Chinese Theatre is like a barn in the interior. Entrance to it is obtained through a long and dismal passage leading out of Jackson Street. This is the Chinese quarter of the city, and here you see this singular people, whose idleness is industrious, and whose frivolity is earnest, engaged in all sorts of commendable and objectionable amusements and occupations. Passing into the auditorium, which is bare and cheerless, a mere den, in fact, I saw the orchestra seated on the back of the stage. They were of all ages, the youngest being not more than six years of age. Any thing so infernal as the noise they made cannot be described by a human pen. It was a combination of clash and shriek, not only deafening, but dangerous; for, in the moments of wildest frenzy, the walls of the rickety old building fairly shook with the din. There was no curtain, and the actors all entered by a door on one side of the orchestra, and made their exits by another door on the other side.

I found Je Horge's services as interpreter invaluable. He regretted that we had entered so late, as thus we had missed witnessing the birth of the baby of Fan Kwi, a sight which, as he assured me, was intensely interesting. I told him that I regretted it quite as much as he.

Fan Kwi now entered. Why Fan Kwi should have painted his upper lip and the end of his nose a very bright white, I could not imagine, nor could Je Horge inform me. At Fan Kwi's entrance, the orchestra broke forth with redoubled fury, and Fan Kwi, in a dolorous strain, as utterly unmelodious as he could contrive to make it, informed the audience that his wife was quite as well as could be expected. This took him a long time, as he was very minute in his explanations. And then his wife appeared, and reiterated the same pleasing information.

Oh, the beauty of the wife of Fan Kwi! Who can sufficiently praise the lustre of her eyes, the vermilion of her lips, the clearly-defined smile which continued immovably on her face even in the most trying crises of dramatic action? And, if she was lovely when she stood still, what was she when she moved? Such an undulating creature I never saw before! She would put one foot forward, turned out as no female foot not Chinese could be, and then, with a curious writhe which undulated through the tips of her long and slender fingers, she would bring the other up to it; and thus she accomplished

a whole step. In one hand she held a shapeless doll-baby, which she managed much like a fan, and which, containing the necessary apparatus for making a noise in its little breast, was enabled at times to add to the general uproar.

After the exit of the wife of Fan Kwi, the father of Fan Kwi appeared. In the usual recitative, he informed the audience that he was a grandfather, and that he gloried in it. Then the wife of Fan Kwi reappeared, and a long, a very long, duet on the subject of the baby ensued. Finally, the white-nosed Fan Kwi reappeared. Yet, why should I murmur at his white nose? At Salt Lake City I saw a Mormon low comedian who had painted one-half of his face scarlet, and the other white, bisecting his countenance by a line of inky blackness, drawn from the roots of the hair to the end of the chin, running down the nose; and I did not complain. In justice, then, I must accept the nose of Fan Kwi.

Now came the dramatic action of the piece. On looking at his innocent child, Fan Kwi discovered a suspicious resemblance to a friend of the family's. On communicating this discovery to his wife, she became nervous, whereupon Fan Kwi killed the child. He gouged out its eyes, and stepped on it two or three times, until it seemed very much exhausted; and then he handed it very politely to his wife. That lovely creature looked at it, and immediately died. Her method of dying was, to say the least, peculiar. She fell rigidly back, taking care not to let her head touch the floor. The stage-manager ran to place a cushion under her head. She undid her hair, and then expired peacefully. Fan Kwi, struck by remorse, died also. The manager placed a cushion under his head, and the orchestra grew more and more energetic.

Now, although this was very evidently only the beginning of the play, and although Je Horge assured me that I really ought to stay and see more of the performance, I took my departure at what might have been an artistic conclusion of the whole matter. Whether Fan Kwi ever came to life again or not, I cannot say; for, on passing into the entry, all thought of his adventures was driven from my mind by a person who rushed in front of us, and began a wild oration in which he seemed to accuse us of being thieves and murderers.

Here beginneth the great Chinese tragedy. The person who so accosted Je Horge and myself was Kum Wang. Kum Wang is a respectable washer and ironer in San Francisco, and to Kum Wang did Je Horge owe the sum of two dollars and a half. Now, nickels have but recently been introduced to the Pacific coast—hitherto, the lowest recognized coin has been a bit, or silver dime—so that nickels were new, consequently bright in their lustre, and calculated to mislead, if not to deceive. To Je Horge I gave a two-cent piece of great refulgence, which he received with an effusive gratitude, quite overpowering to me. I did not know before then how low the human jaw could fall; but, when Je Horge was informed that it took five of these radiant coins to make one bit, I felt that I realized how far a face could be stretched. For some hours Je Horge was downcast, and I heard no melodies from him, either native or foreign. Then he appeared before me with a triumphant air, and said:

"Me payee Kum Wang."

I told him I was delighted to hear it. Alas! I made no allowance for the low wiliness of the nature of Je Horge. He had paid Kum Wang, but it was with the two-cent nickel of radiant brightness, and not with the proper coin. Kum Wang was more than satisfied at the time; but he soon discovered Je Horge's trickery, and here, in the entry of the Chinese theatre—a narrow, dingy, uncomfortable place, at best—he had seized upon him, and demanded satisfaction. It was not pleasant either for Je Horge or for myself. Kum Wang was a small man of more than ordinary Chinese volubility. His head drooped; he clasped his hands; he was pale; he almost wept as he described the value of the two dollars and a half which Je Horge should have paid him. Then followed a monologue on the nature and character of Je Horge. According to Kum Wang, Je Horge was the lineal descendant of animals whose names and natures I shall not particularize. The genealogy was in strict accordance with the theory of Mr. Darwin. After Kum Wang had finished, Je Horge began. If half of what Je Horge asserted were true, there never was such a monster existing before the present day as Kum Wang. For the sake of humanity in general, and San Francisco in particular, I refuse to believe the assertions of Je Horge.

This scene in the vestibule had already attracted many spectators, and seemed to be quite as interesting as the performance in the

theatre itself. A policeman—Hibernian to the core—appeared and added a new element to the scene. He did not disapprove of fighting; he only wished the combatants to move on, and intimated that he knew a quiet and retired spot near by, where the affair could be settled. With an alacrity which rather saddened me, Je Horge exclaimed:

"Me no fightee!"

On hearing these words, Kum Wang brandished aloft a large knife, and, without coming perceptibly nearer, announced his intention of killing Je Horge. No sooner had Je Horge heard these words than he turned and fled. Kum Wang then began another strophe, and I, rather weary of the affair by this time, made the best of my way home.

Still fearful of the vengeance of Kum Wang, Je Horge has not yet stirred forth from the house. Kum Wang has, undoubtedly, justice on his side; and the life of Je Horge, limited as it is at present to our kitchen and back yard, is rapidly becoming a burden. Still there is a sort of heroism in the manner in which Je Horge persists in not paying Kum Wang. I can hardly keep from believing that there is a matter of principle at the bottom of it all, so firmly and unflinchingly does Je Horge bear the burdens which dread of Kum Wang entails on him. Still, I can see the end. Kum Wang will obtain entrance to us in some unguarded moment; he will harangue us and Je Horge; Je Horge will not yield, and we shall be obliged to liquidate his debt. We are resigned to our fate. In the mean time we wait and admire the new traits which are daily developed in Je Horge.

FRED. W. LORING.

HERBERT SPENCER AND HIS PHILOSOPHICAL SYSTEM.

THE position occupied in the world of thought by the subject of the present sketch, is no longer doubtful; he is placed in the foremost rank by the suffrage of the foremost men. Mr. Darwin, in his late work, speaks of Mr. Spencer as "our great philosopher;" Mr. J. S. Mill long since pronounced him "one of the most vigorous as well as boldest thinkers which English speculation has yet produced;" Mr. Lewes says, "He alone, of all British thinkers, has organized a philosophy;" and Dr. McCosh, in his late lectures in this city, recognized him as the master-spirit of the school to which he belongs. The influence of that school is thought by many to be mischievous, but few will deny that it represents the most advanced and powerful intellectual movement of the age. To have attained the leadership of such a movement, and to be the recognized author, in the present advanced state of knowledge, of a new *organon* of philosophy, broadly based in the sciences of Nature, involve such transcendent powers of mind, and such immense force of character, as abundantly to vindicate the remark of an eminent clerical teacher, himself an influential leader of advanced opinion, that "Spencer is king of the thinkers of this age."

Mr. Spencer's life has been quiet and uneventful, furnishing little material for biographic curiosity. Its course may be summed up in a few words: He was born in Derby, in 1820, and was an only surviving child. His father was a teacher, and directed his son's education with much judgment. At twelve years of age he left home to reside with an uncle, the Rev. Thomas Spencer, with whom he studied mathematics and prepared for the profession of a civil engineer. This was his avocation for eight years, when the great railroad revulsion of 1845 threw him out of business, and he took to literature as a profession. He at first wrote extensively for the reviews, and then published the several volumes of miscellaneous works which are well known to the public.

In 1860 he commenced the publication of a "System of Philosophy," broader in its scope than any thing which had been previously undertaken. It was an attempt to organize our latest and highest knowledge of Nature, life, mind, and society, into a unified system. The time had come for bringing these great divisions of knowledge into closer relations. If the order of things around us is capable of being understood, such a system must be possible, for the oneness and grand interdependence of Nature are undeniable.

The great principle from which he started, and which guided the whole course of his inquiry, was that of progress, or the gradual un-

folding of the universe in time. The foundation of his philosophy is the law of Universal Evolution. The history of the solar system and of our own planet has been a history of progressive unfolding on a mighty scale. The career of every living thing is an evolution, and such has also been the career of the earth's historic life. Mind follows the law of life, and undergoes evolution, so that this principle gives us the deepest interpretation of mental philosophy. Humanity, as it consists of progressive elements, is also progressive. Knowledge, art, science, religion, civil institutions, and the whole social scheme, have exemplified the same principle of growth, or unfolding to a higher condition. Mr. Spencer maintains that all these changes have been governed by one great principle; and that, as all matter obeys the simple and universal law of Attraction, so all orders of existence,

in the on-goings of time, are obedient to a universal Law of Evolution. Mr. Spencer has made it the great object of his life to trace out this law in its causes, conditions, limits, and in the varied phases of its manifestation, and this is the comprehensive purpose of his philosophical system. Because all things human are imperfect, that system, no doubt, has its imperfections; but that it brings us nearer than ever before to an understanding of the true order of things around us; and that, however incomplete as yet, it opens the great line of inquiry which the human mind must pursue in the coming centuries, can hardly be doubted by any who have given it the serious attention which so vast a subject demands. The Philosophy of Evolution is no vain or empty speculation. It has been foreshadowed for a century; its witnesses are on every hand; it is becoming more and

more verifiable with every step of advancing knowledge; it is a philosophy which reconciles conflicting systems, which explains to us the past, which illuminates the present, and glorifies the future. If any think that we are here indulging in rhapsody, we appeal to the exposition itself. Four volumes of Spencer's system are now published. "First Principles" lays the foundation of the scheme, and works out the general law of evolution. The "Biology," in two volumes, applies the law to the world of life. In Volume I. of the "Psychology," the phenomena of mind are treated from the same point of view. By the parts thus already accomplished, the system may be fairly judged, and there is no hazard in saying it will rank among the noblest monuments of the intellectual genius of man. Any one who will take the trouble carefully to compare the four volumes of Jowett's "Plato," just published, with the four volumes of Spencer's philos-

ophy, will gain an impressive idea of the mighty advance that has been made in our knowledge of the order of the universe, while for the purpose of such a contrast no other modern work is at all comparable with that of Spencer.

This is no place to go into an exposition of Mr. Spencer's philosophy; but it is a fit opportunity to correct certain gross misrepresentations by which many have been prejudiced against examining it. Mr. Spencer's system has been charged with being atheistic and materialistic. We will here consider the first of these charges, and take up the second at a future time. Let it be observed that Mr. Spencer denies holding atheistic doctrines, and repeatedly condemns atheism as an absurd and an unthinkable view of the universe; but those who assume that they know more of his system than he knows himself,

insist that the obnoxious doctrine is nevertheless *there*. But, if not avowed, it must be inferred: What, then, are the grounds on which it is inferred that this scheme of doctrine is atheistic?

In constructing a system of philosophy, by which Mr. Spencer means an organized body of thought that shall represent the truth of the order of Nature, he was confronted at the outset with the problem of the legitimate bounds of inquiry. His first question was: Is it possible for man to know every thing? Are all the imaginings of the human mind equally valid? Is the realm of past speculation coextensive with the realm of legitimate knowledge? To these questions Mr. Spencer replies that, as man is finite, there is a limit to his power of knowing; that there is a sphere of knowable and verifiable truth, and a sphere beyond it where inquiry leads only to pseudo-knowledge—an ap-

pearance of knowledge without the reality. Obviously, if the human mind can waste its energies over fruitless speculations, and, transcending its due limits, can attain to a semblance of knowledge which may be mistaken for that which is real, it is of the highest possible moment to determine where this limit is to be found. The question was a practical one for Mr. Spencer; yet it had been already substantially settled—settled by a complete historic revolution of ideas.

It is a noteworthy fact, in the history of the advance of thought, that primitive opinions are often not only erroneous, but are the exact opposite of the actual truth; that they not only undergo modification, but total reversal. The earth, at first supposed to be flat, turned out to be round; it was at first believed to be stationary, it is now known to have various and rapid motions; it was believed to be recent in

HERBERT SPENCER.

origin, it is now found to have had a vast antiquity; the early notion was that man was descended from the gods, the latest notion is that he is derived from the humblest creatures. A like contrast exists between the earlier and the later views of what it is possible for man to know. In the infancy of speculation it was held that physical Nature cannot be understood, but that beyond Nature there is an ideal sphere to which reason can penetrate, and from which it can pluck forth the profoundest secrets of being. But, as the speculative faculty became disciplined, it was at length perceived that thought *can* comprehend the order of natural phenomena, and that a science of the phenomenal is therefore possible; while to get beyond phenomena into that transcendent sphere of pure truth, or absolute being, is impossible to the human faculties.

This is the position taken by Mr. Spencer in fixing the scope of his philosophical system. He accordingly prefixed to it an introductory argument of one hundred and twenty-three pages, entitled "The Unknowable," in which he circumscribes the philosophic ground, and indicates where inquiry, having real knowledge for its object, must ever stop. That limit is found to enclose only the phenomenal order of the universe. As man is finite, he can only know the finite; and by the very constitution of his faculties is debarred from penetrating the mysteries that are beyond it. Of matter in its kinds and properties, as masses and particles, elements and compounds; of force in its various affections, as heat, light, gravity; of mind, as manifested in the phenomena of feeling and thought, man can inquire and understand; but of the ultimate nature, essence, or cause of matter, force, or mind, he knows nothing—these things are buried in impenetrable mystery. Mr. Spencer maintains that this result follows from the very constitution of the mind and the quality of intelligence. What is it to know? To know, we have to know *something*; and, of course, we have to know it as this or that, as like something else, or different from something else. We know things by their contrasts and resemblances; that is, we know them in their relations to each other. All analysis of intelligence brings out this as its essential element, and the principle is designated the *relativity* of knowledge. Whatever transcends relations, and cannot be compared or classed; whatever is unrelated, unconditioned, or absolute, is, therefore, beyond our mental reach—is unthinkable and unknowable.

Fully to unfold this doctrine, and the reasons on which it rests, would take more space than can be at present allowed, and we are not here concerned as to whether it be a true or a false doctrine. What does concern us is, that it is the basis on which the charge of atheism is brought against Mr. Spencer's system.

To this it may be replied, first, the doctrine is not Mr. Spencer's—it has been long and extensively held by philosophers and theologians, so that, if it be atheism, half the thinking and religious world will have to be dragged into the abyss with him; and, second, the doctrine, as explicitly held by Spencer, falsifies the charge.

In the first place, then, be the doctrine, in its implications, what it may, it is not Mr. Spencer's, and he nowhere claims it as his own. All he has done is, to give a forcible and impressive exposition of it, and put it to the practical use of defining the sphere of his work. He had, in fact, no choice in the matter, for the principle had been arrived at by the general advance of intelligence, and nothing was left for him but to recognize it. The doctrine that knowledge is limited and relative, and that human thought cannot transcend it—that, "to know more, man must be more"—was recognized ages before Spencer was born, and had grown into a definitely-formulated and widely-accepted philosophical belief before he began to write.

No man has seen more clearly or deplored more eloquently that false pride of the human mind by which it has been led to scorn the field of its proper action, and spend itself in regions of futile and impossible inquiry, than Lord Bacon. He said: "The real cause and root of all the evils in science is this, that, falsely magnifying and exalting the powers of the mind, we seek not its true helps." And, again: "Man, the servant and interpreter of Nature, can only understand and act in proportion as he observes and contemplates the order of Nature; more he can neither know nor do." Locke also perceived the limitation of the human faculties—that there are things beyond it, to which access is forbidden—and to those who regarded this as a derogation from man's dignity he replied: "We shall not have much reason to complain of the narrowness of our minds, if we will but employ them about what may be of use to us, for of that they are very capable; and it will be an unpardonable as well as a childish peevishness if we

undervalue the advantages of our knowledge and neglect to improve it to the ends for which it was given, because there are some things set out of reach of it."

The doctrine thus explicitly enunciated in a general form centuries ago has been proclaimed by recent thinkers as an inevitable result of the analysis of the human mind. Sir William Hamilton maintains it as a fundamental tenet of his philosophy. He says: "To think is to condition, and conditional limitation is the fundamental law of the possibility of thought. . . . The mind can conceive, and consequently can know only the limited. . . . It cannot transcend that sphere of limitation within and through which, exclusively, the possibility of thought is realized. . . . We admit that the consequence of this doctrine is, that philosophy, if viewed as more than the science of the conditioned, is impossible."

Dr. Mansel, Dean of St. Paul's, in his "Limits of Religious Thought," says: "The very conception of consciousness, in whatever mode it may be manifested, necessarily implies *distinction between one object and another*. To be conscious, we must be conscious of something; and that something can only be known as that which it is by being distinguished from that which it is not. But distinction is necessarily limitation; for, if one object is to be distinguished from another, it must possess some form of existence which the other has not, or it must not possess some form which the other has." When we attempt in thought to transcend the finite, the result arrived at, according to Dr. Mansel, is, not truth or knowledge, but constant confusion and contradiction. "The conception of the absolute and infinite, from whatever side we view it, appears encompassed with contradictions. There is a contradiction in supposing such an object to exist, whether alone or in conjunction with others; and there is a contradiction in supposing it not to exist. There is a contradiction in conceiving it as one, and there is a contradiction in conceiving it as many. There is a contradiction in conceiving it as personal, and there is a contradiction in conceiving it as impersonal. It cannot, without contradiction, be represented as active, nor, without equal contradiction, be represented as inactive. It cannot be conceived as the sum of all existence, nor yet can it be conceived as a part only of that sum."

Nor is this doctrine to be regarded as a mere speculation of a few erratic thinkers. Sir William Hamilton, whose acquaintance with the history of philosophic opinion has been excelled by no man in modern times, says: "With the exception of a few late absolutist theorizers in Germany, this is, perhaps, the truth of all others most harmoniously reëchoed by every philosopher of every school." And among these he names Protagoras, Aristotle, St. Augustine, Boethius, Averroes, Albertus Magnus, Gerson, Leo Hebræus, Melancthon, Scaliger, Francis Piccolomini, Giordano Bruno, Campanella, Bacon, Spinoza, Newton, Kant.

It would be sufficient to rest the case here, for Mr. Spencer may be well content with his company; and if it were stated with whom the opprobrium of this obnoxious charge is to be shared, there would be no complaint; but this is by no means the whole case. Even if the doctrine of the relativity of knowledge, as held by Hamilton and Mansel, and taught from their text-books in half the colleges of the country, be an atheistic doctrine, it is not, as thus expounded, the belief of Mr. Spencer. As maintained by him, the principle is rescued from any such possible interpretation. Hamilton and Mansel hold that, beyond the relative, the human mind can find *nothing*. Their logic brings them to absolute negation. Mr. Spencer insists that this is a totally erroneous view—the result of incomplete analysis—and that the deepest implication of the law of relativity necessitates a reverse conclusion; or, that The Unknowable is not a negation, but an absolute reality.

We cannot give his acute and masterly reasoning on this important point, but will state his conclusion: "Every one of the arguments by which the relativity of our knowledge is demonstrated distinctly postulates the positive existence of something beyond the relative. To say that we cannot know the absolute is, by implication, to affirm that there *is* an absolute. In the very denial of our power to learn *what* the absolute is, there lies hidden the assumption *that* it is; and the making of this assumption proves that the absolute has been present to the mind, not as a nothing, but as a something. . . . It is rigorously impossible to conceive that our knowledge is a knowledge of appearances only, without at the same time conceiving of a reality of which they are appearances; for appearance without reality is unthinkable.

able. . . . At the same time that by the laws of thought we are rigorously prevented from forming a *conception* of absolute existence, we are by the laws of thought equally prevented from ridding ourselves of the *consciousness* of absolute existence."

It is true, Mr. Spencer holds that the Infinite Power of which all things are the manifestations, as it transcends the knowable, can never be *known*; but are not Scripture and theology full of the same doctrine? The phrases, "Can man, by searching, find out God?" "A God understood would be no God at all;" "To think that God is, as we think Him to be, is blasphemy," are attestations of the common belief that we cannot know the Infinite Cause. For ages it has been customary to apply to the Supreme Being the terms Incomprehensible, Mysterious, Inscrutable, Unsearchable, until these terms have come to be actually employed as substantive titles of the Divine Being. What does this imply but that the Divine Nature cannot be known? Moreover, this view has prevailed increasingly in the ratio of man's increasing intelligence. In his lowest state, the god he worships may be a visible object; as he grows more intelligent, the conception of divinity becomes more abstract and spiritualized, until at last it passes all understanding. If, therefore, Mr. Spencer, rising to grander conceptions of the knowable universe than perhaps any other man has ever attained, is overwhelmed with the impossibility of forming any conception of its Infinite Cause, and chooses to mark his own sense of limitation and humility by designating the Supreme Power as The Unknowable, who shall assume to construe such a course as a denial of the Divine Being?

It is a profound mistake to suppose that Mr. Spencer's philosophy is a system of negation or denial; on the contrary, it is eminently a constructive and synthetic system. He is no iconoclast bent upon the demolition of men's cherished and sacred convictions; he cordially recognizes the soul of truth in these convictions, and builds upon it. So far from seeking to strike away the Supreme Object of religious faith, or to cast discredit upon the religious principle, he affirms the validity of both in the most unqualified and impressive manner. So far from regarding the religious feeling in man as baseless, transient, or unreal, he holds it to be an essential and indestructible element of human nature.

Mr. Spencer is as catholic in his sympathies as he is wide and clear in his perceptions, and, while his system takes no account of the dogmas of sects, at the very outset it affirms religion for humanity. And here again the world is probably destined to a complete reversal of one of its ancient and cherished beliefs. Hitherto religion has been held to consist in adherence to the ever-changing creeds by which faiths and sects have been separated, while but little value has been assigned to that which is common and essential to all; but with increasing enlightenment dogmatic differences will slowly disappear, and that which was at first unrecognized will at length become supreme. This tendency is already strongly marked among the better-instructed classes of society, and Mr. Spencer but gives it a final and permanent expression. It is the eminent claim of his system that it opens the way to a resolution and adjustment of the old and rankling antagonisms of belief. Searching for the deeper concords of truth, and habitually regarding man in all the elements of his unfolding, more than any other system that has ever appeared it is the philosophy of harmony and reconciliation.

E. L. YOUMANS.

FISHING OFF THE COAST OF NEW JERSEY.

THE rough line of sea-front extending from the entrance of the harbor of New York to the Capes of the Delaware, a distance of one hundred and twenty miles, affords within its comparatively-limited space one of the choicest fishing-grounds in the world. For many generations the inhabitants occupying this somewhat desolate and isolated region of the Atlantic coast have made "fishing" a business; the ancestors of the present active generation found the sterile soil little adapted to agriculture, but the unprecedented abundance of Old Ocean was ever at the command of "easy industry," and thus the people always thrived, and in later days have made a great and most profitable business in supplying the surrounding population with fish.

By some law which governs the migrations of ocean-life, fish

which are more especially esteemed valuable for food in early spring seem to head toward the Jersey coast, and here they remain through the entire summer and late in the fall; in fact, it is not until the fresh airs of coming winter chill the shallow water that they seek the more genial regions of the South, or sink into the depths of the sea, below the influence of borean blasts. Thus it is that in the finest weather the great self-produced crop of fish is gathered.

The appliances of the market-fishermen are, as a rule, simple and inexpensive. The little skiff, the more pretentious but still small sail-boat, make up the list of water-craft, to which must be added the strong nets, many of the simplest contrivance, such as Peter and his companions, over eighteen hundred years ago, used in the Sea of Galilee. But modern American mechanical ingenuity, illustrated by the fishermen of the Jersey coast, has added the "pound." Its principle of action is very similar to the gin used by "pot-hunters" to secure the bright-eyed quail. In a favorable position, and at a right angle from the shore, a "net-fence" is erected, from nine hundred to a thousand feet in length. At the extreme end of this obstruction is placed the pound, another strong net, arranged so that its walls represent a room about twenty feet square. Every thing properly disposed of, the waters far above and below the trap are rudely disturbed, and the fish, all unconscious of danger, leisurely pursue their way until they strike the fence; then, alarmed, they rush toward deep water and are guided into the pound, where their captors leave them until ready to ship them to market. The "catches" on many occasions are thousands and thousands of every variety of fish known to the coast.

The fishermen have their professional peculiarities. Like all disciples of the "rod and line," they are hospitably disposed, and steady-going and quiet in their demeanor; they are, as a class, never in a hurry, and give little heed to the cares and excitements of the outer world. Their game is noiseless and timid, their homes are isolated, and they (the fishermen) insensibly conform their thoughts and manners to their surroundings. Nor is the theory that, as fish contain an unusual amount of phosphorus, therefore the eating of them especially strengthens the brain, rendering the consumers of flounders and horse-mackerel poets and statesmen, sustained by intercourse with the semi-marine population of Squam Beach or Tuckahoe Inlet; on the contrary, they are very practical people, sharp at a bargain, and greatly given to thrift and to putting their surplus dollars in farms and savings-banks.

To give even the popular names of the many varieties of fish caught off the Jersey coast would occupy a large space; some of the favorite varieties alone can be mentioned. Fish most valuable for food and commerce are those which are of delicious taste, and of such hardy constitution that they will retain their excellent qualities for some length of time after being taken from the water. The weak-fish and the blue-fish, two of the gamest, so far as taking the hook and fighting for life are concerned, are unexceptionable if they can be transferred all glistening, as if studded with silver, to the grill of the cook, but they lose their best qualities by other treatment, and are, therefore, less popular than their numbers and intrinsic qualities should command. From June to October they are more or less plentiful, often so beyond conception. Hundreds of each kind have been in a few hours caught by a single line, and their capture by nets often is immense. Both are game to the last degree, and fight with a *vim* very unusual to the finny tribe. We know of one patriotic gentleman who was relieved from the unpleasant duties of "the military draft" because a huge and most voracious blue-fish had demolished his thumb. The largest-sized weak-fish will weigh fifteen pounds; the blue-fish, it is said, will sometimes reach fifty. When thus exaggerated by an abundance of feeding, they are properly designated, on account of their great strength, "horse-mackerel," a most characteristic cognomen, for, if caught by a strong line, in their struggles to escape they will sometimes tow the fisherman's boat against the wind.

The black-fish, the porgy, the sea and striped bass, and perch, are all familiar in our markets among the rich contributions from the Jersey coast.

The mackerel, a few of which only are caught, are justly admired for their delicacy; but our Jersey fishermen have never gone to the expense necessary to capture them "out at sea," where they abound, and hence in our city markets they are known as "Boston mackerel," a concession to the New-Englanders' taste for hunting in deep water.

TROLLING FOR BLUE-FISH.

FISHING FROM THE BEACH FOR BLUE-FISH.

GOING OUT FOR WEAK-FISH.

THE RETURN.

PREPARING THE FISH FOR MARKET.

In this connection we must mention the Spanish mackerel, undoubtedly the most beautiful of all the fish of the sea. In years gone by it was supposed to be confined to southern latitudes, but such is not now the case, for it exists in great numbers "far out" on our coast. Sooner or later the proper craft to take them will be provided, and then they will become a familiar and not an exceptionable dish upon our tables.

The sheep's-head, not only on account of its intrinsic merit, but from the great firmness of its flesh, is a deserved favorite among all epicures, and, although dealing in them is a lucrative business, and they are caught by the thousands, yet it is seldom they are offered at public sale. These fish visit the Jersey coast in the month of June, and remain until fall. Their strong teeth and powerful jaws are admirably suited to crush the hard covering of the mussel and other shell-fish on which they naturally feed. Made desperate by hunger, they will attack the juvenile clams, and graze upon offensive, spongy-looking masses of marine vegetation which line the bottom of the sea. They are a socially-disposed fish, and seemingly very much affected by changes in the atmosphere. Hence it is that old and highly-successful sheep's-head fishermen will watch the weather, and never make a venture until the barometer indicates that it is a favorable time to visit the feeding-grounds.

It would be inexcusable if we should neglect that most useful and locally popular fish known as the moss-bunker. It is very oily, very coarse, and very full of bones. It possesses every unfavorable quality of the shad and the herring. It seems designed by Providence as a sort of *migratory bait* destined to hug along the shore for the purpose of attracting within the reach of man the richer and more excellent treasures of the sea. The quantities which are sometimes caught literally represent a miraculous draught of fishes. They have on some special occasions been so numerous in the small bays as to impede the progress of a skiff, and were bailed out of the open waters by the cart-load, and piled up on the meadow-land in great, towering heaps. The Jersey farmer uses these fish for manure, and most rebellious are unaccustomed nostrils to the effluvia by which the moss-bunker renews its vulgar disposition. Yet no plague has resulted from this singular appropriation, nor have the most acute philosophers in "book-farming" ever been enthusiastic enough to inform themselves of the true value of this most novel fertilizer.

All along, from Sandy Hook to the Capes, hidden away in the broken and cosy nooks of this apparently arid soil, are the single cottages and little villages of the professional fishermen. Their lives are not spent in hardship, nor are their rewards for labor meagre. The consequence is, that you will find them living cosily, and often blessed with much of the world's goods. If the steamer which takes you down the bay turns to the right, just as you reach Sandy Hook, you will run into Shrewsbury River. Here you have the great serpentine bar of the Hook on your left, while, on your right, tower up what are known as the Highlands. On the very top of this great sea-cliff are two light-houses, which are so ingeniously placed that, if the seaman ever loses in his observations the sight of the vista between them, he is out of his reckoning. Just opposite these "eyes of commerce" is the little village of Seabright. Here the people are industrious and prosperous, and present probably the very best example of the routine of the Jersey fisherman's life.

Close as this place is to the metropolis, the fish which crowd upon its neighborhood have no experience of danger. Guided by an unseen and unerring wisdom, they annually come to Seabright and other places—homes of men bent on their destruction—and yield up their lives, as if in humble acknowledgment of the supremacy of man over the land and the sea. Here it is that the tyro from the heated streets of the metropolis sometimes wanders; and, having the universal taste for hunting revived in his soul, he will, with fifty others possibly, seat himself upon the timbers of a neighboring bridge, and patiently fish with line and bait. The general result is that innumerable valuable specimens, denominated the pilot, the Lafayette, the little blue-fish, weak-fish, striped bass, and the aristocratic sheep's-head, seem to rejoice to leave the free waters of the clear blue sea to swallow the bait offered by these 'prentices of the rod and line; and oftentimes a few hours' united work of such inexperienced hands has resulted in the accumulation of three thousand pounds of the best specimens of the finny tribe. Surely, such abundant reward is not to be met with elsewhere in the world.

In addition to fishing in the bays, the men employed in their small

sail-boats go some distance from the main-land, where, in deep water, they secure the finer specimens, which are so attractive to old gentlemen with large purses, large girth, large appetites, and large families, and to ambitious keepers of popular hotels. Trolling for fish is one of the most exciting sports, and, as success is not the result of experience, it is sometimes a matter of grave speculation to decide whether the tyro in the boat, or the blue-fish at the end of his line, is most astonished.

Fifty years ago, our pleasant fishing-coast of New Jersey, now the seat of happiness and prosperity, was one of the horrors of the hardy children of the sea. The stern, repulsive headlands, from Sandy Hook southward to Cape May, were associated with marine disaster. Human hearts, however brave, and human hands, however strong, too often failed in the hour of peril off this dreaded coast. But, when the untiring arm of steam came, as an obedient assistant to the overwrought sailor, and the dreaded rocks and precipices had their towers by day and their warning lights by night, the Jersey coast became less traditional of danger; and, when the denizens of our crowded city, suffering from the labors of a long winter, and sweltering under summer heats, fled to these rocky, sandy coasts, and made them the centres of health and refinement, these once rude places became famous for their happy homes as well as for their teeming depositories of food. So do the ameliorations of the times change unpleasant traditions, and the waste places of the imaginary and the real world alike grow bright and hopeful.

But even now, in the far-off seas, there still gather in the fore-castle, at the idle hours of the night-watch, old "sea-dogs" who have never known a pleasurable excitement, except it were a triumph over danger—"ancient mariners," who tell of tales of suffering off the "Barbary shore," and of the ever-unappeased rage of the great, hungry "rollers" that come surging in upon the rock-bound coast of Norway. These hard-visaged sons of Neptune, whose faces are tanned by "nor'westers" until the muscles seem of pliant bronze, still speak of the times when, nearing that Jersey coast, they saw peering over the waves of the deep-blue sea the very crown of the Neversink; and how it contrasted with the surroundings like a bit of gold on the horizon; and how they saw, away to the north, that mysterious light which always overhangs a great city; and how the idle men hung listless over the taffrail. Then of a sudden there came through the heated air a cold breath, as if from the cave of Death, and the waters suddenly grew black as ink, and the great waves sunk down angrily under some unseen power. Then the horizon all round rolled up its dark clouds, as if the curtains were being removed, that they might look into the blackness of the coming storm. A moment more, and the headlands disappeared as if drowned in the angry water; and the old, weather-beaten ship, that had safely chased the great whales in the Arctic Seas, and had been carried even in safety on the thick floes of moving ice, staggered back, and labored as if paralyzed, shrinking from the coming contest with the enraged elements.

Fierce and terrible was that storm on the Jersey coast, and the men strained their hardened thews, and toiled, and worked, to wear off the ship, that they and it might meet the accumulating dangers in the open sea. But all was in vain. The demon of the storm triumphed; the hurricane sent the struggling craft back upon the rocks, where the surging waves broke into the mid-air, and the great surf seemed to travel heavenward; and the last evidence of human sympathy that many of these mariners had of this world was the steady, unflinching light that, in spite of the conflicting elements and surrounding death, gave caution and hope from Barnegat.

T. B. THORPE.

AMONG THE INEBRIATES.

DOWN a shabby, neglected-looking street; past frowzy tenement-houses, with ash-heaps and garbage-boxes in front, and more garbage in the gutters than in the boxes; past a dark, dull wall, enclosing a dark, dull building of enormous size, and struggling, disjointed architecture; past a gateway in the wall, through which thousands have been taken to die, and ambulances, stretchers, backs, and carts, are passing day and night with sick, stabbed, shot, and mangled humanity; past another and newer large building, where doctors, professors, and hare-brained students deliberate, dissect, and

make mischief; past a third building, low, and dark, and sombre, with loungers looking curiously through the glass doors, and sad-faced men and women going and coming through an iron gate-way, with "MORQUE" in hard iron letters a few inches above their heads; past burying wagons and bustling men, through a broad, high archway, with a neat office on one side, and a wide-awake man at the door collecting fare from all who approach—past all these and much that is not noted, and we are on the dock, whence a small, bright, tidy steamer is ready to start on her daily trip up the river.

The gangway plank comes in with a sweep, hauled by a dozen strong hands; a rush is made from the dock entrance by people who are always late, but who manage to get aboard without first tumbling into the water; the lines are cast off, and our bright, pleasant little boat heads toward the Sound. We run up close to the west shore, and see many odd sights and queer places, which keep us thinking and wondering till the boat suddenly turns eastward, and, in half an hour from the starting-time, she is fast to the landing at Blackwell's Island. Part of the freight is discharged, and some of the passengers go ashore, and presently a gang of miserable-looking men, almost in rags, with shivering forms (for the morning is sharp) and slouching, unsteady gait, and some more miserable-looking women, with unclean tatters for clothing, and discolored eyes, and half-healed gashes on their bloated faces, are driven aboard like cattle, and huddled into a corner, where they shiver and chatter till we lose sight of them half an hour later by landing at Ward's Island. The boat soon starts forward again, and we make our way toward a broad, high brick building, which is pointed out as the Soldiers' Retreat.

It is located on the highest part of the island, and we reach it by ascending many successions of short stairways. Entering at the main door, we find several soldiers lounging about, all apparently past their fighting days. The building is nominally a home for disabled defenders of the Union, but only part of it is occupied by them. The soldiers appear in clean, bright uniforms, and seem to be satisfied with the place and their lot. This building, ostensibly the Soldiers' Retreat, is also a public asylum for inebriates who can pay, or whose friends are willing to pay, for their keeping. It is under the control of the Commissioners of Charities and Correction, but as all the inmates, except the soldiers, have to pay or be paid for, it cannot be truly called a charity institution.

The first peculiarities which strike us are the comfort and perfect freedom of the place. Well-dressed men are walking up and down the long corridors. The door is open and unguarded, and if they choose to go out and stroll around the grounds no one observes or objects. Some are smoking, some chatting, and all appear to be unconscious of restraint. Knowing beforehand that the place is an inebriate asylum, and entering with the expectation of finding a system of discipline, one is surprised at the absence of restrictions. The men walking about possibly feel that they are not free to do as they please, but there is no indication of the feeling in their manner.

Do they appear like drunkards? Not at all. Are they confirmed, habitual inebriates? Yes, the majority are, but not all. Some are sent here to prevent their becoming drunkards; some come of their own accord, to be away from temptation; many are confirmed by relatives or friends, either to save them from self-destruction or with the hope that they will come out cured of their terrible passion for liquor. But realizations of the hope are rare. In the great majority of cases the passion has become too strong before its victim is confined, to be permanently conquered or eradicated. A few inebriates form good resolutions and keep them for a few months, perhaps, after their release; but the old appetite returns, and these unfortunate men are sent back to their old quarters. And it frequently happens that not more than a week elapses between the discharge of an inebriate and his reappearance.

But there are none of the class called common drunkards here. A man found intoxicated in the street and committed for drunkenness, is sent to Blackwell's Island and compelled to work. None go to the inebriate asylum but those who can pay or be paid for, as has already been said. Those who become a public charge are placed on the same level with convicts, and required to labor as they do. And if an inmate of the asylum runs out of funds before his term expires, and no one comes forward to pay his weekly board, it is the rule that he, too, shall be sent down to Blackwell's Island, put on prison fare, and obliged to make return for it in work. The enforcement of this rule is frequent, but not invariable.

Of what social order are the inebriates? Well, there are here some men who stood well in society, men of culture, high intelligence, refined manners; professional men, tradesmen, men who have been merchants; in brief, representatives of almost every class are or have been inmates of the institution. We ask if we may pass through it and see how they live. No, the rules forbid that. Each man pays his way as he would at an hotel or boarding-house, and is entitled to privacy if he desires it. No visitor is allowed to pass beyond the reception-room—at least, he cannot enter any other apartment, though he may view several others at a distance sufficient to prevent possible recognition of some person whom he may know, and who may prefer to be unseen. We drop into conversation and learn much that interests and surprises. The substance of it is noted in memory.

"A pretty comfortable place, isn't it?"

"Yes; capital. We have every thing we want. It would have been well for most of us if we had come here long ago. Nothing to do but amuse ourselves and pass the time as pleasantly as we can."

"How do you manage that?"

"There are various ways. Down there, you see" (nodding toward the end of a long corridor, leading to a spacious, well-lighted room), "is the library. After breakfast we go there to read the papers. All the city papers are on file, and we know what is going on everywhere better, perhaps, than you do; for you have little time to read, while we have plenty. The library is well supplied with books, besides, and we have free access to them all day. We could not be better supplied with reading matter by the Mercantile Library than we are here."

"You have recreations, too, I suppose?"

"Certainly. There is the billiard-room. Those who wish to play may do so any time they please. You can hear the balls now. They are hardly ever still. When we tire of billiards, we have dominoes, checkers, and chess—almost every game, in fact. It is easy to fill up the day in the library, playing billiards and checkers, or strolling around outside."

"But you cannot leave the island."

"No, unless the doctor gives a pass, and at any rate we are better off here. Those who do go to the city occasionally, gain nothing by it. The temptation to return to old habits is often too strong, and the good that has been done is undone. If a man really wants to reform, he had better stay here till he can make pretty sure of controlling himself. If he goes out too soon, he gives way and becomes as bad as ever."

"Is there any system of cure practised?"

"No; not even temperance. You'd think it rather strange, I suppose, if asked to take a drink in this place. Well, I have been offered liquor several times since I came here, but I always refuse. I don't care a fig for it any more. But others do indulge, though. There are some men here who take more or less every day. I don't pretend to know how they get it, but they do get it somehow."

"Do you fare well in regard to board?"

"First-rate. There is nothing to complain of. I live just as well here as I did at an hotel. The food is good and well cooked, and we have plenty of it. No regular bill of fare, of course, but what is provided is just as good as we want. It is cheap, too. The cost is five dollars a week, and we live better for that than we could for twice as much in a boarding-house in the city."

"Do all pay the same amount?"

"Oh, no. Those who pay five dollars a week sleep in a ward—about a dozen in one room. Some have rooms to themselves, and pay ten dollars. The rooms are well furnished and as comfortable as hotel parlors. A few have rooms *en suite*, and their meals are taken to them. These pay twenty or twenty-five dollars. They would not be better off in a fashionable house in Fifth Avenue."

"They must have means to pay so much."

"Means! Why, some of the men in this place are rich. But they can't control their money. Before any man comes here, some one must make an affidavit that he is incapable of managing his affairs, and the person must be one who has a direct interest in him. While he remains here, his property is under the control of those who have him committed. They pay for him, unless he has money in hand to pay for himself. And if his property warrants it and they are generous, he gets the best accommodations, and fares a great deal better, perhaps, than before he came."

"A man can commit himself, I suppose, if he chooses to do so. Is that ever done?"

"Yes; quite often, I understand. I am not sure that it is so, but they tell me that it is not unusual for a man who has been drinking a little and wants to have an easy time for the winter, to go to the office of the commissioners, accuse himself of being a drunkard, and say he wants to be sent to the inebriate asylum. He pays down twenty or forty dollars for one or two months' board, comes over here and lives till the cold weather is past, and then goes back to the city. But unless he looks like an inebriate they won't take him, so he manages that by pretending to be intoxicated while he is really playing a sharp game. A man of this kind often turns up in the asylum several winters in succession."

"What is the general effect of confinement here? Does it reform men or make them worse?"

"Well, so far as I know, very few are made temperate by it. Most of those sent here come against their will, and feel humiliated and resentful. It sometimes breaks a man's spirits completely to be served in such a way, and when he gets out he takes to drink worse than ever. Others make up their minds to "pay off" those who cause their committal, and show them that they won't be forced into abstinence, and when these are released they go back to the old habits. But some do really reform, though no systematic effort is made to wean them from the taste for liquor."

Three or four well-dressed, intelligent-looking men having passed while we are talking, it is remarked that their appearance would not indicate what they are.

"If I told you their names you would be surprised. You have often heard of those men, and no doubt considered them solid and respectable. Why, some of the cleverest men in New York have been here—men of first-class intellect and accomplishments—literary men, lawyers, merchants, men who were esteemed and even courted in society. You see that large building" (indicating one of the most graceful public edifices to be found within a thousand miles of New York)—"well, the plan of that was drawn in a room up-stairs. The architect designed it while confined here as an inebriate. Others get credit for it, but the plan was drawn by him and adopted by a firm in the city. Yes, there are some clever men here, and, if it were not against the rules to go through the building, you might see some you would not expect to find here."

"Are no visitors allowed to go through?"

"No, it is strictly forbidden."

"What is the object of that?"

"It is plain enough. These men don't want to be seen. If persons coming in every day were allowed to go here and there as they pleased, there would be no seclusion. When a man is put into a place like this he feels that he is disgraced, and of course he does not like to run the risk of facing persons who may know him, but who do not know that he is here."

Saying some ladies in the reception-room, a remark is made about their presence.

"They are bound to see all they can, and, if they get any chance at all, you can't prevent them. A few weeks ago one of the commissioners brought some lady friends over, and of course they wanted to go everywhere. He pointed out rooms which they must not approach, saying the occupants would rather not be seen except by their friends. While he was engaged talking, one of the ladies slipped away, and, when Mr. — turned, he saw her peeping into one of the forbidden rooms. He was very angry, called her back, told her she had violated a rule that no one was allowed to transgress, cautioned her against doing the like again; and what did she do but laugh heartily in his face, and say *she* wasn't going to shut her eyes when there was a chance to see any thing!

"But," said he, "those men don't want to be seen."

"Then, they have no business coming here. You won't catch me shutting myself up where no one can see me."

"That is their way generally. If you reason or expostulate with them, they'll laugh at you; so the only plan is to shut them out altogether."

We have learned enough to satisfy us that, for a man so addicted to liquor that he has become its slave, it would be difficult to find a better place than this public inebriate asylum. Outside of it there is a general impression that the institution is a sort of almshouse or penitentiary. This supposition causes many unfortunate men to

shrink from the thought of being sent thither, and their friends to hesitate long before taking measures for confining them. But it is an error. The asylum can hardly be regarded as in any respect eleemosynary. Certainly it is no more so than a private hospital, where patients are received and treated at certain fixed rates. The rule here is the same. But the asylum is under the charge of public officials, and this goes far to create the impression that it is a charity institution, or a place of punishment.

The inmates are more comfortable and better cared for than persons of their class could be outside of an asylum. They are provided with all that is necessary to their well-being—good food, clean and well-ventilated sleeping-apartment, means to improve the mind and keep themselves informed on all current topics, and ample facilities for recreation. If free to follow perverted inclinations, undoubtedly they would not fare so well. And the expense of living here is trifling in comparison with that attending every-day life in towns and cities. But the chief point to be considered is the certain prevention of harmful indulgence in liquor while the victim of intemperance is confined in the asylum. He may not be wholly deprived of that which his depraved appetite craves, but what he obtains of it is not sufficient to do him injury.

It is much even for one man to be saved from a drunkard's grave. The number of persons converted to temperance by residence in the asylum may be small in proportion to the number not reformed, but, if even a few are thus rescued, a great good is accomplished. Those whom we saw during our visit bore in their appearance testimony to the value of the institution. Take them to Broadway and let them mingle with the throng, and no one would suppose them to be inebriates. In dress and physical looks, they would compare well with the ordinary well-to-do citizen, though probably before their confinement many of them were in a state of constant intoxication, and rapidly descending the road that leads to disgrace and utter ruin.

DANIEL CONNOLLY.

ALONE.

AH!—it seemed when the Master called him
That my faith and hope were fled,
But my darlings are ever with me—
They are back from the days long dead—
As I sit through the winter evenings
When the firelight flickers low,
Till each childish face grows fainter
And fades with the fading glow.

As I dream in the deepening darkness,
They linger around my chair—
The youngest a bright-eyed cherub,
And the eldest tall and fair;
So my worn old heart grows younger,
My hair seems no longer gray,
And the long, long nights of winter
Bloom sweet as a summer's day.

But the fairest maid—my youngest—
She lingers the last with me,
To prattle her childish prayers
With her head upon my knee;
While the others mount the stairway
She kneels in the ruddy light,
And then—with her soft arms round me—
A kiss, and a fond good-night.

Do I think of my first-born fading
On that dark November morn,
All her fair face white with anguish,
When she died with her babe unborn?—
Nay! for me they are *ever* children—
No change with the changing year,
As I sit and call my darlings
By the names they loved to hear.

And I wonder if up in heaven,
 'Mid the pause of saintly psalms,
 They think of the old dame dreaming
 Through these weary wintry calms,
 If a tremor of earthward yearning
 May flit, in that pause of fest,
 O'er the lips of the little angels
 That once were at my breast.

Oft I lie by the window watching,
 When the world is hushed to sleep,
 How the wondrous eyes of heaven
 Peer soft from their mystic deep,
 Till it seems that my darlings call me,
 And I name me a star for each,
 With one lonely planet pining
 For the home it failed to reach.

So my gaze is ever upward
 As my eyes grow moist and dim,
 Seeking through earthly sorrows
 For the paths that lead to Him;
 While I sit in the solemn stillness
 And wait for my promised crown,
 Still blessing the mighty Master
 Who sends these angels down.

Slow the embers are fading, fading,
 Till their light has ceased to glow,
 While I hear through the dusk the music
 Of a voice that I used to know;
 I feel on my feet break coldly
 The waves of the shoreless sea,
 While the darkness around me deepens,
 Ah—hush!—They are calling me!

EDWARD RENAUD.

THE FREE-LABOR AND INTELLIGENCE BUREAU.

ABOUT two years since, the Commissioners of Public Charities and Correction in the city of New York, in view of the fact that the ranks of pauperism and vice received large and constantly-increasing accession from the unemployed female-labor market, and that the organizations then in existence for procuring employment were notoriously inefficient and inoperative, determined to establish an official bureau which, from its systematic nature and the comprehensiveness of its operations, should secure the confidence of employers generally, and the comfort and convenience of employes, protecting the latter from the delays, disappointments, and temptations, inseparable from private institutions of an eleemosynary and irresponsible character.

This they did in Plimpton's Building, at the corner of Stuyvesant and Ninth Streets, under the superintendence of Commissioners Bell, Bowen, O. W. Brennan, and Nicholson, the Hon. Alexander Frear having since been added to the number. Some two or three months' experience, however, proved that the work before them was of such vast magnitude and importance, and the task so onerous, as evidenced by the avidity of both employers and servants to avail themselves of the advantages of this cheap and effective medium, that they resolved to remove to their present commodious office in Clinton Place, corner of Mercer Street, and, with an enlarged and efficient staff of officials, to develop the enterprise to its fullest limit. Accordingly, in the month of May, 1870, the present able and energetic superintendent, Mr. James Donahue, assumed the entire control of the bureau; and, through his courteous and business-like administration, and the hearty coöperation of his coöfficials, it furnished, during the year 1870, thirty-four thousand eight hundred and four individuals with situations, out of forty thousand two hundred and five applications, or about seven-eighths of the entire number on the books—thus providing more than three thousand five hundred respectable male and female

servants each month with means of livelihood, who would otherwise have swelled the lists of the "pauper-roll," or augmented the ranks of vice and dissipation. During the four months of the present year, the monthly returns have exhibited an increase of fully thirty per cent. on those of last year, the books of the bureau showing an average of four thousand one hundred and fifty-seven applications per month, of which three thousand five hundred and fifteen found employment.

The *modus operandi* is extremely simple and complete. There are three entrances to the building—one for the male and one for the female applicants for employment, the front entrance being devoted to the use of employers. A lady desiring a servant is ushered into the offices on the ground floor, where a clerk inscribes in a book prepared for the purpose the name and address of the employer, and the kind of servant required, to which entry a number is attached for facility of future reference. This accomplished, the applicant is furnished with a ticket (blue or red, according to the locality of her residence in town or country), bearing the initials G. H. W., C., etc., as signifying a servant for general house-work, cooking, etc. She then proceeds to the sitting-room, and awaits the advent of the servant, who has been summoned by a clerk from the upper rooms, where she and a number of her fellow-servants are in waiting. A preliminary conversation ensues, and, if the negotiations are satisfactory, the engagement is at once made, the two parties proceeding to a table in the vicinity, where the wages to be paid, and all other particulars, are duly entered by a clerk. Should the servant first sent prove unsuitable, the employer is allowed to "interview" any number of the applicants, until she finds one equal to her requirements.

Meanwhile, the scene at the servants' entrances is of a different character. The persons seeking employment tender their names to the clerk at the desk, furnishing him with all particulars as to situation sought, past career, etc.; they are then given tickets similar to those furnished to employers, and take their places in the room appropriated to their respective classes. Subsequently, a summons arrives through the speaking-pipe, "Servant for general work, city, wanted." The first applicant in that capacity is then introduced by the guide to her prospective employer, and so on in succession until all are suited with servants and situations. Such is the hourly and daily routine of this invaluable and praiseworthy institution. But there are other features to observe in the system, which reflect the highest credit on the commissioners and superintendent, and which deserve the especial attention of the public generally. Applicants, when entering their names on the books of the bureau, are required to furnish truthful and connected accounts of their career prior to application, and to present credentials from previous employers; and, on leaving any situation to which they have been introduced by the bureau, the cause of their leaving or dismissal is duly ascertained and recorded, so that the remarks opposite each number in the "engagement-book" furnish a complete and reliable history of the applicant's career, and frequently guide the superintendent and his staff in the selection of suitable servants for the situations vacant. By any serious offence against honesty or morality, the applicants are at once and forever excluded from all the benefits of the institution.

The good effects arising from an institution so admirably and efficiently conducted can be better imagined than described. By its operation, employers can always be supplied with servants, and servants with employers, exactly suited to them in disposition, proficiency, habits, and Christian profession, etc.; and the results achieved by it, during the twelve or thirteen months which have elapsed since its improved organization, signally prove that it has worked and is destined to effect a still greater social reformation, and to effectually and satisfactorily solve the important and much-vexed question of how to obtain good servants and good employers.

It is a matter of great congratulation to the citizens of New York and its neighborhood that they have so valuable and effective an organization, and that the officers controlling it should have given so practical a recognition of the truth of the axiom that "prevention is better than cure." The area of its operation is limited only by the confines of the continent itself; its influence is boundless; and its results will surely be found in the state records of future generations, which, from the decrease in pauperism and crime, will most effectually and truthfully proclaim its praises.

FREDERICK J. GARBIT.

TABLE-TALK.

M. THIERS seems to have only narrowly escaped, in one respect, the fate of the fabled Frankenstein. It is he, more than any Frenchman of the age, who has fed the greed of national vanity and love of glory, until this monster has threatened to destroy him who nourished it. Thiers would not feel flattered to be classed in the same category with the visionary and raging *sans-culottes* who were so long able to shut him out from the capital; yet the wildest of them have not exhibited a blinder devotion to *toutes les gloires de France* than this statesman and scholar, who aims to found a new political system. For more than half a century he has persistently urged an ultra "French" policy. He began, at twenty-three, by writing a history of the first revolution, which glowed with the military triumphs of the republic, and wherein his pen seemed always eager to hasten from the dry details of legislation and finance, to the stirring scenes of the frontiers. Still more pernicious was his "Consulate and Empire" in its influence on the popular mind. It was a fulsome panegyric, in twenty volumes, of Napoleon I., and its lesson was, that aggression, rapine, pillage, and all the ills of war visited upon weaker countries, were as nothing in the balance with French glory and aggrandizement. In his long career as a statesman, he seemed never to look beyond the interests of France and of his own power. Nothing, in his eyes, was unjust which could wreath new laurels—though they were bloody and vain—about the brow of *la patrie*. In 1866 he berated Napoleon III., in his crispest and snappiest style, for not interfering in a quarrel with which France had nothing to do, and for not preventing the unity of the German people in spite of themselves. In 1870, the only objection he could urge to the late war was—not that the provocation was frivolous, or that the imperial course was wrongful—but that France was not ready. It is not encouraging for France that she should have at the head of her administration, at the time when, of all others, she needs the highest qualities of statesmanship, a man who has grown old thinking that military glory is the noblest achievement of a nation, and that to be an arbiter in Europe is the only claim which France can put forth to the respect of the world. Even the best French statesmen—such men as Jules Favre, Simon, and Pagés—seem to be tainted with this worship of *la gloire*, and are not yet sufficiently advanced to proclaim the gospel of peace and thrift, and to announce, as the future programme of the country, an abandonment of effete balance-of-power vanities, and the development of the mental and material resources of the people. France needs a wise statesman, as a few months ago she needed a great general. She has had a cruel awakening; but Thiers, it is to be feared, is not the man to point out for her the moral of her recent tragedy.

— A lady writes to a Boston newspaper, giving reasons apart from those connected with what is due to ladies on the score of politeness or chivalry, why women when riding in street-cars ought not to be required to stand.

She says: "It was the beautiful custom of the fathers of this generation to see no woman standing if they could give her a seat. Why? Because, without thinking any thing more about it, their very manliness pleaded to them for her that she was the 'weaker,' and therefore less able to stand than they. But the theory of their self-indulgent and irreverent sons is that 'women can stand as well as men,' and therefore they allow her to do so. Is this true? Many a woman is as tall as her husband, but compare his long and broad foot in its thick boot with her little one in a delicate shoe, arched and slender, and about two-thirds of the size of his. Compare the body that she has to support on that foot—its small bones, soft muscles, swelling and heavy contours—with the large bones, firm muscles, small hips, and spare limbs of his strong frame; reflect, moreover, upon the internal structure of her organism, the frightful danger to which strain or over-fatigue may expose it—including the possible murder of the unborn—and then insist, if you can, that women can stand as well as men. It is not true; they cannot." These reasons are conclusive, we think, but they have a wider significance than the writer appears to imagine. They touch the very key-note of this whole woman-question, and indicate the proper solution to it. When the rights of women are studied in the light of physiology, it will be discovered that the old-fashioned notion as to woman's place in the social scheme was, in the main, a just and accurate instinct. Women are often unfortunately under the necessity of laboring for their support, and, so long as this is the case, more avenues of labor ought to be opened to them. But in a rightly-constituted society women would not be permitted to labor, excepting, perhaps, in the lighter employments that make no strain upon their physical powers. "Reflect," says the extract above, "upon the internal structure of her organism, the frightful danger to which strain or over-fatigue may expose it—including the possible murder of the unborn." Herein lies the reason why women should abandon all thought of a competitive struggle with man, and why men, mindful of the welfare of the generations to come, should insist that the mothers of their children should be protected with all solicitude and care in the performance of their great function. Our women have accomplished fully their share in the labor and duties of the world in becoming mothers, and it is quite impossible for them to share with men the fatigues and exaction of handicrafts and professional labors, without weakening them in a way that will tell severely upon their offspring. Nature asserts the law which gives the real attitude of the female sex, and the strong-minded cannot disregard the dictum without injurious consequences. What women ought to insist upon is their right of exemption from all kinds of prolonged or exacting labor; in this plea Nature and science would support them, and all right-minded men would become their advocates and defenders.

— It would be amusing if, after all, the gentler sex should have the glory—and the responsibility—of tearing away the veil which

has so long shrouded the mystery of "Junius." Even great men, it seems, are not exempt from the danger of betraying themselves by their love-letters. And then, what a fearful confirmation such a *dénouement* would be to the complaint of crusty old bachelors, that women cannot keep secrets! For, according to the latest *soi-disant* discoverer of the real Junius, one of his bright-eyed sweethearts, more than half a century after her death, gives the clew to his discovery. Falling in love with a young lady at a ball, Sir Philip—of course, it is Macaulay's and Carlyle's Sir Philip Francis—sends her soon after some exquisite verses, politely (as the custom then was) expressing his rhapsodies in the most careful and neatly-termed metre and expression; but—as if half-consciously fearful to confide to feminine hands the tell-tale evidence of chirography—very studiously disguising his hand. He requests a friend to enclose the verses to the fair maid, and soon forgets all about it. The fair maid religiously treasures up the effusion of so courtly a gentleman and so gifted a suitor; and so it lies, yellowing and paling gradually, among other keepsakes of youth, to be read in after-years with heart-flutterings and gentle sighs, and to be left behind at last for the curious and colder eyes of posterity. The waif passes on through we know not—or care not—how many hands, and is abruptly, in the good year 1871, dragged from its mouldering obscurity, and put upon the witness-stand against its author. Experts cross-examine it, with their lenses and logic, and declare its family resemblance to the letters of Junius to be quite unmistakable, and proof positive of the identity of parentage. There is a group of confirmatory evidence gathered about this central point, and we have another and perhaps final argument that Francis and Junius were one. So that the "shade of a name," which, according to the mysterious writer's boast, was to "remain," vanishes in presence of a delicate *billet-doux*, and the solid, substantial British name, with its knightly prefix, and its positive history, usurps its ghostly place. Books, equal in amount of matter to Junius's letters four times repeated, have been written to identify that greatest of English satirists and masters of invective. Why Junius should wish his name to be forever a secret will never be known. We can see reasons why it should be so kept during his lifetime, for he had dared to attack the person of the sovereign, and carry his warfare to the throne itself. But Junius must have known his letters to be masterpieces, and so enduring; and, in this age of brass, it is difficult to imagine a man so constituted as to disdain the immortality which great achievements in art and letters yield.

— The journals inform us that, at a Presbyterian meeting in Chicago, Dr. Hall made an address denouncing the "flood of fashion and folly that is rushing over the land." He instanced the fate of Rome, Florence, and other republics, which grew to rottenness before they were ripe, all through extravagance in dress and living, "and hoped that the women of America would soon return to that simplicity of dress and Christianity of character which laid the republic." Has Dr. Hall consulted recently the portraits of those

eminently-respectable people, his great grandparents? If not, will he be so good as to examine the gallery of portraits in Mr. Griswold's "Republican Court," and tell us frankly what he thinks of the simplicity of dress there exhibited? If Dr. Hall will carefully examine this matter, he will discover that simplicity of dress has almost steadily increased for many centuries, and that in this particular we are far in advance of our ancestors. Let him compare the powdered wig, the ruffles, the lace, the elaborate costume of gentlemen a hundred years ago with his own. The essential difference between now and then is that, while formerly only those persons of acknowledged social position indulged in elaborate dress or extravagant living, now there is a large number of people who imitate the manners and extravagances of their betters, to the public scandal and their own injury. But, after all, how small a proportion of the population are extravagant in dress or method of living! The rural population form the great majority of the people, and with them simplicity and frugality are the rule. And so, also, are they with our work-people in the cities, with artisans, handicraftsmen, mechanics. Even a majority of merchants and tradesmen are plain folk, and live quietly and simply. The idle and the extravagant have some accessions to their rank, no doubt, but the great mass of the people have not the power to be otherwise than frugal even if they would. We recollect that when, during the panic of 1857, a great outcry rang against the extravagance of women, which some people imagined brought on the financial troubles, a statistician computed that there was an average of but one silk dress to every four women in the country. Dr. Hall need not despair.

—We copied in a recent number of the *JOURNAL* an account given by the poet Bryant of the mode of life which he had pursued for many years, and to which may fairly be attributed his remarkable health of mind and body at a very advanced age. A Georgian, who professes to be ninety-six years of age and a carpenter by trade, has been moved by Mr. Bryant's letter to give his own method of preserving health, which is somewhat different from that of the poet. He says: "I get up about five in the morning; drink about six or eight drinks of good, solid corn-whiskey by about eight o'clock. By that time I have jacked off and dressed about five hundred feet of plank, more or less; then take breakfast. My breakfast is generally a smothered chicken and a stewed catfish or two or three trout; sometimes two or three shad, with beefsteak and ham and fried eggs, with two or three dozen boiled eggs, fifteen or twenty batter-cakes, with a little coffee or tea—say about six or eight cups—just as I feel about the number of cups. I then joint, tongue, and groove the plank. By about one o'clock I am ready for putting up or down, at which time I dine. My dinner is not always the same; but generally I take about three or four quarts of turtle or pea soup, a small baked pig or a roasted goose, sometimes a quarter of a lamb or kid, greens, beans, peas, onions, eschalots, potatoes, cabbage, and other like vegetables, by which time I have drunk about fifteen or twenty drinks of old, solid

corn-whiskey. After dinner I put up or down my plank, as the case may be; take a few drinks during the time, say about twelve or fourteen. I then take the last meal, which is generally called tea; don't use any meat; drink about six quarts of good buttermilk, with about one and a half or two pounds of light bread; take about four drinks to hold it steady, lay down about eight, and rest better than if I had crowded my stomach. I then rest well, dream pleasant dreams, and rise early again. This has been my mode of living through life. I am stout and active; weigh from two hundred and sixty to two hundred and seventy-five pounds; health fine. My head is as black as a gander's back. I am not very extravagant in using tobacco; only use about two or three plugs a day, say one and a half pounds; smoke some and chew the balance—not that I like the weed; use it only to keep my flesh down."

Scientific Notes.

DR. VÖLCKER has delivered a lecture before the Chemical Society, London, "On the Productive Powers of Soils in Relation to the Loss of Plant-food by Drainage." The lecturer began by showing the futility of the belief that a soil-analysis could reveal whether a land was productive or not. To those who only imperfectly know the teachings of modern agricultural science, it appears very simple to remedy a deficient soil by finding out, through analysis, the wanting constituents, and then to supply them. But this is not so. Not only is it difficult exactly to analyze a soil, but many other conditions besides the composition of a land have to be observed. The state of combination in which the mineral constituents of a land are found, the physical condition of the soil, the presence or absence of some matter injurious to the growth of plants; all these are so many important points upon which soil-analysis throws no light whatever. The lecturer equally opposed the views of those who advocate that in a system of rational farming there should be kept up a debtor and creditor account, as regards the constituents which are removed from the soil in the crop grown upon it, and the quantity of fertilizing matter restored to it in the shape of manure. The fertility of the soil cannot be maintained, much less increased, if only as much fertilizing constituents would be applied to the land as one removes from it in the crops. Dr. Völcker then discussed the relative values of various mineral salts as manures, quoting, in support of his views, the results of the classical field experiments of Lawes and Gilbert; and this then led the lecturer to speak of the examination of land drainage-waters. Lawes and Gilbert, throughout a long series of experiments on the growth of wheat, have experienced a great loss of nitrogen. The amount of nitrogen supplied in the manure was greater than that recovered in the increased produce. It appeared to Dr. Völcker that the nitrogen lost might have passed into the drains. Careful collection of such drainage-waters and their analysis proved Dr. Völcker's supposition to be correct. It became clear that in whatever form the nitrogen is applied to the soil, a large proportion of it is carried off, chiefly in the form of nitrates. At all times of the year, but especially during the active period of growth of the crops, nitrates are found in the watery liquid which circulates in the land, whereas ammonia

salts are never met with in any appreciably large quantities. It may therefore be assumed that it is chiefly, if not solely, from the nitrates that the crops build up their nitrogenous organic constituents. Dr. Völcker's analyses of drainage-waters further showed that potash and phosphoric acid, which certainly are the most important mineral constituents for the plant, are almost entirely retained in the soil; while the less important, as lime, or magnesia or sulphuric acid, pass with greater readiness out of the land.

Professor Maxwell, in a recent lecture before the Royal Institution, gave some interesting facts concerning color-blindness. Color-blindness is a not infrequent defect, and many people are unable to distinguish between certain colors which, to ordinary people, appear in glaring contrast. The reason for this is thus given: There are three systems of nerves in the retina of the eye, each of which has for its function, when acted on by light or any other disturbing agent, to excite in us one of these three sensations. No anatomist has hitherto been able to distinguish these three systems of nerves by microscopic observation. But it is admitted in physiology, that the only way in which the sensation excited by a particular nerve can vary is by degrees of intensity. The intensity of the sensation may vary from the faintest impression up to an insupportable pain; but, whatever may be the exciting cause, the sensation will be the same when it reaches the same intensity. If this doctrine of the function of a nerve be admitted, it is legitimate to reason from the fact that color may vary in three different ways, to the inference that these three modes of variation arise from the independent action of three different nerves, or sets of nerves. The defect, then, of color-blindness consists in the absence of one of the three primary sensations of color. Color-blind vision depends on the variable intensities of two sensations instead of three. In all cases which have been examined with sufficient care, the absent sensation seems to resemble that which we call red. People who are color-blind, as a rule, deny also that green is one of their sensations; but they are always making mistakes about green objects, and confounding them with red. The colors they have no doubts about are certainly blue and yellow; and they persist in saying that yellow, and not green, is the color which they are able to see. To explain this discrepancy, we must remember that color-blind persons learn the names of colors by the same method as ourselves. They are told that the sky is blue, that grass is green, that gold is yellow, and that soldiers' coats are red. They observe a difference in the colors of these objects; and they often suppose that they see the same colors as we do, only not so well.

One of the most curious facts in connection with chemical research, is the remarkable vitality of the lower organisms in Nature. In vegetable subjects, for instance, vitality may lie dormant for a period which is almost inconceivable. Stramonium-seeds, according to Duhamel, can develop after remaining twenty-five years under ground. Friewald observed the generation of melon-seeds after they had been kept more than forty years. Pliny goes so far as to say that corn grew after it had been kept a hundred years. And there seems no reason to doubt the fact; for Desmoulins obtained plants from seeds found in a Roman tomb of the third or fourth century. Moreover, it is well known that corn found in some of the tombs of ancient Egypt has germinated and grown to perfection; and the result of the ex-

periment of sowing some of this mummied corn has been the production of new ears, larger and far more prolific than those of our modern wheat. A squill-bulb, too, found in the hands of a mummy, has, when planted at the present day and in England, grown and blossomed as readily as the last year's hyacinth-bulb from Holland, which flowers in our windows every spring.

Some of the investigations made by M. Sintrae, one of the most scientific silk-culturists in Europe, appear to possess a value which may be available in America as well. His experiments prove that silk-worms succeed much better when raised in the open air than when confined in close rooms; and, instead of the worms requiring to be kept at a high temperature and carefully preserved from all sudden changes, M. Sintrae finds that they bear very well a temperature as low as forty-seven degrees and as high as one hundred and four, and that they are not injured by the direct rays of the sun nor by sudden alternations of temperature. They are even unharmed by rains and thunder-storms. The disease that has been so prevalent among silk-worms in Europe, and which called for so large an importation of foreign eggs, is attributed by M. Sintrae to the worms being confined in too close rooms. The only shelter he gives them is an open shed, with roof sufficient to protect them from wetness. The good result of this system of management is shown by the fact that thirty-eight ounces of eggs furnished three hundred and seventy-two pounds of cocoons, besides a large yield of eggs.

An Edinburgh physician, in a communication to the *Philosophical Journal*, repudiates the opinion generally entertained by chemists in regard to the action of water on lead pipes. He asserts that observation and experiment have led him to conclude that certain pure soft waters do not act upon lead, while certain hard waters, which are regarded as most protective, do act chemically upon it, and, therefore, such pipe is dangerous to use in conveying that kind of water for domestic purposes. It has generally been taught and believed that hard water, which contains neutral salts in solution, does not become impregnated with lead in passing through the pipes; pure water, on the contrary, being readily affected with the lead properties; that the neutral salts in water prevent it acting upon the lead, while the oxygen of water not containing such salts has such an affinity for the metal that it leaves the hydrogen and acts chemically upon the metallic surface.

Experiments have recently been made, with considerable care, with the view to the employment of coal-dust as fuel in locomotives, instead of the usual lumps of coal or coke distributed over a grate, and the plan is said to realize some important advantages of convenience and economy. In the ordinary system of burning coal of the common size much uncombined oxygen passes through the furnace, since only that portion enters into combination which comes into immediate contact with the burning fuel, the incandescent surface of which is of moderate extent. By minutely dividing the fuel, however, and mingling it as dust with the air, the extent of the combining surface is, it is asserted, greatly extended, and a much more complete combustion is the result.

A method of rendering wood measurably incombustible, and for preserving it when underground, is proposed by Dr. Reinsch. The

wood, which must not be planed, is placed for twenty-four hours in a liquid composed of one part of concentrated silicate of potassa and three parts of pure water. After having been removed from this liquid and dried for several days, the wood is again soaked in this liquid, and, after having been again dried, is painted over with a mixture of one part cement and four parts of the liquid above described. After the first coat of this paint is dry, the painting is repeated twice. Of the paint-mixture alluded to, too large quantities are not to be made up at once, because it rapidly becomes very dry and hard. No tests or experiments are reported of the value of this method over other processes for the same purpose, but the *Chemical News* states that wood thus treated is rendered unflammable, and does not decay underground.

Attempts are making abroad to introduce the artificial growth of the finer and more valuable sponges. When the sponge is first gathered at the bottom of the sea it is covered with a black gelatinous substance, resembling vegetable granulations, among which microscopic white and oviform bodies may be distinguished. These are the larvæ destined to perpetuate the species. When arrived at maturity they are washed out by the sea-water which incessantly flows through the sponge; they then swim along by the aid of their vibrating hairs until they reach a suitable rock, to which they attach themselves, and there commence a new life. This emigration of the larvæ from the parent-sponge occurs about the end of June and the beginning of July. The sponges preferred for this purpose are those found on the coasts of Syria, where they are collected before the perfection of the larvæ, transported to the localities desired, and arranged in stone troughs and sunk.

One of the most costly and magnificent—and probably much the largest—photographic portrait-lens ever made is one produced for Mr. Mayatt, the celebrated English photographer. It is an achromatic lens, ten and a half inches in diameter, and will take portraits of any size, from the smallest miniature up to very nearly the full life-stature. It is made of glass of the whitest and purest description, and its size admits so large a volume of light that photographs covering a space of ten by twelve inches may be done in eight seconds. In the open air groups of fifteen to twenty persons—each face about the size of an English sovereign, and the whole picture two feet long and two feet wide—can be taken with an exposure of ten seconds. The cost of manufacturing this lens was upward of one thousand dollars.

Miscellany.

Gesture-language in Italy.

IN Southern Italy there is current a venerable story, which is here given with all reserve, as the diplomats say; in other words, it is totally unworthy of belief. The story is this: A stranger present at a cabinet-council in Naples, after some silent pantomime had taken place, asked when business was going to begin, and was told that it was over.

"But," objected the astonished stranger, "nobody has said a word."

"True," was the answer; "but surely you observed what was going on?"

"I saw nothing going on," said the stranger, "except a few shrugs and grimaces, and the king signing his name. You don't mean to say you call that business?"

"Of course," was the answer. "What's the use of a long talk, when we can express our meaning as well, and more quickly, by signs."

The story, though an exaggeration, is, nevertheless, not so utterly absurd as it seems to the English reader. Southern Italians use a great deal of gesture while speaking; not because they are deaf or dumb, for they are quick of hearing, everlasting talkers, and remarkably intelligent, but because they have picturesque instincts, and are not satisfied with expressing their ideas by feeble words; while they satisfy their natural impatience by using gestures in lieu of whole sentences, and can, and do, occasionally carry on conversations without any speech at all. For example: I have seen a man in a balcony near the top of a house narrate entirely by gestures his day's adventures to a friend on the ground-floor of a house on the opposite side of a street.

The gesture-language is believed to be, in the main, the same all the world over; still, in places widely apart, in which the habits of life are very different, it is natural to expect a corresponding difference in a language which is plainly imitative, and nothing else. In Mr. Tylor's work upon the "Early History of Mankind," which contains a very interesting account of this language, it is stated that, according to the general practice of mankind, shaking the head is the sign for the negative "No." In Southern Italy, however, shaking the head never means "No," but always, "I don't understand you; what do you mean?" while "No" is expressed by elevating the chin and protruding the under-lip a little; and a still stronger negative by the same movements, to which is added scraping the under-side of the chin with the tips of the right-hand fingers, holding the knuckles outward, and the fingers slightly bent. In the curious affidavit in support of the will of a deaf-and-dumb man, unable to read and write, quoted by Mr. Tylor, which explains the signs used by the testator to express his testamentary wishes, it is to be observed that the testator expressed his death by laying the side of his head in the palm of his right hand, and then lowering the right hand, palm upward, to the ground. In Southern Italy, a Catholic country, death is expressed by making the sign of the cross with the first two fingers of the right hand held together, upright, before the face, that being the final action of the priest when administering the sacrament to a dying person. The gesture by which the English deaf-and-dumb man expressed his death would, omitting the lowering of the hand, mean, in Southern Italy, sleep. In this country we beckon a person toward us by holding a hand or finger with the tips upward. In Southern Italy, however, the tips are held downward, and the English manner of beckoning is used for salutation. The verb "go" is expressed in Southern Italy by holding the open hand, the palm perpendicular, to the ground, and pointed in the intended direction, and shaking the hand up and down from the wrist; while in this country we simply point with the index-finger. In Southern Italy hunger is expressed by extending the thumb and first finger, keeping the others closed, over the mouth, and giving a rotary motion from the wrist. The reader is at liberty to try this upon any organ-grinder he meets, and mark the result. "To-day" is expressed by closing all the fingers of the right hand except the index, then pointing downward, making a rapid slight movement of the hand up and down; "to-morrow" is the same, except that the movement is greater, and from the elbow. Numbers, of-course, are shown by holding up the fingers.

The History of Diamond-cutting.

Argument would be unnecessary to prove that this wonderful art originated in India, where the diamond was first discovered. The Romans, who undoubtedly derived their diamonds from this source, were ignorant of the methods of cutting and shaping these gems, and, as the Hindoos especially prized natural stones having a certain original lustre, the Romans wore them in this condition. A perfect example of this is found in the clasp of Charlemagne's mantle, composed of four large uncut diamonds, very probably a legacy of his imperial predecessors. A few rings of the period of the Lower Empire have come down to us, convincing proofs that the Romans wore them in their natural condition. The Hindoos, though perfectly aware of how to cut the diamond mechanically, were as ignorant a thousand years ago as they are to-day of producing all the brilliant effects of this king of gems. Desirous only of keeping the stone as near as possible to its original weight, they blindly followed every eccentricity of shape, making irregular planes, and covering defects or flaws with innumerable facets. In this condition the Koh-i-noor came to England. In Europe this method was continued until Louis de Berghem, of Bruges, in 1475 first boldly gave to the diamond precision of form. The important art of cleavage was discovered a century later, but, strange to say, was lost, to be found again only at the middle of the last century. In France, however, notably under the auspices of Cardinal Mazarin, great progress was made; but it is to Vicenzio Peruzzi, of Venice, who had hit on the precise form of the brilliant, that the art of diamond-cutting is mostly indebted for its excellence. He was the first to determine the absolute shape which gave to the diamond the greatest amount of brilliancy. One hundred years ago England cut almost all the diamonds of the world, but, strange to say, early in this century the entire business was transported to Holland, and now Amsterdam monopolizes this trade nearly altogether. Such is the skill of the Dutchmen that craftsmen have frequently gone from Holland to England for the purpose of recutting jewels of exceptional value. An opportunity of comparing the cut with the uncut diamonds may be had by visiting the jewelry establishment of Starr & Marcus, No. 22 John Street, where the curious will find a notable display of brilliant gems.

Balloonng.

For a long time the most famous ascent in aerostatic annals, was that of Gay Lussac, who, in September, 1804, started from Paris and reached the height of twenty-three thousand feet. To lighten the balloon he threw overboard every article he could possibly dispense with; a common deal chair went with the rest, and fell into a hedge close to a girl who was tending some sheep. As the sky at the time was clear, and the balloon invisible, some of the country-folk held that it must have come straight from Paradise, and cried "A miracle!" others refused to think that "the workmen up above there could be such muffs," for the chair was roughly made; but the miracle-mongers would, no doubt, have carried the question had not a timely account of Lussac's voyage appeared in the papers. Several years later, Andreoli and Brioschi ascended, it is said, but it has never been fully believed, to an elevation of thirty thousand feet, when the balloon burst with a loud report, and came to the ground with great speed, but safety, near Petrarch's tomb. The torn balloon must have acted as a parachute. Mr. Glaisher has himself fallen, in his balloon, two miles in four

minutes, and has landed without being greatly hurt. He and Mr. Coxwell became the champion aeronauts after their memorable ascent from Wolverhampton on the 5th of September, 1862. They rose to the enormous height of thirty-seven thousand feet, a mile higher than the highest peak of the Himalayas; at twenty-nine thousand feet Mr. Glaisher became insensible; the valve-line was entangled, and Mr. Coxwell had to climb from the car into the ring to readjust it; the cold was so intense that he lost the use of his hands and had to pull it with his teeth. Green, whose death we lately announced, was in his time the very prince of aeronauts, and made some fourteen hundred excursions into the air; but he was not much of a scientific observer, having (as he told M. de Fonvielle, who visited the old man in his latter days at Aërial Cottage, Holloway) "to make his bread by it," i. e., by mounting into the clouds for the delectation of those who resort to tea-gardens.

A balloon is poised in the air with exquisite delicacy. Tissandier relates that throwing out a chicken-bone caused the Neptune to rise suddenly from twenty to thirty yards, and Lunardi's barometer fell three degrees on his casting away his hat. On sand being thrown out from a balloon rapidly descending, it (apparently) rises into the air, and, as the balloon slackens speed, falls again in a fine shower. The sea is the great bugbear of the aeronaut; to save the land he will almost drop upon it like a stone. Mr. Glaisher, who chose Wolverhampton for his favorite place of ascent, tells us that an aeronaut cannot get far enough from the sea in England, and requires all the land-room of a continent to make his voyage with freedom and comfort. Balloons have a great reputation for danger, but the three thousand five hundred ascents which have been made have only caused fifteen deaths. The most critical moment of an air-voyage is its last; to be able to take the ground well and skilfully requires the greatest presence of mind as well as thorough experience, and even then there is generally more or less of a crash.

Wolf-Rock Light-house.

The English Government has built a light-house upon the Wolf Rock, which is situated about nine miles southwest of the Land's End. The surface of this rock is very rugged; consequently, to land upon it is at all times a very difficult matter. As it is, moreover, in deep water (about twenty fathoms on all sides), and exposed to the full force of the Atlantic Ocean, a terrific sea falls upon it, as may readily be supposed. From this cause the building of the new light-house has been no child's-play. The light was first exhibited on the 1st of January, 1870, and has since burned regularly every night, from sunset to sunrise. But the structure has taken nearly eight years to erect. On the 17th of March, 1862, the workmen first got upon the rock, to cut out the foundation; but owing to the insecurity of the foothold, and the constant breaking of the surf over the rock, stanchions were obliged to be fixed in the rock where the workmen were digging, and each man worked with a safety-rope lying near him, one end of which was attached to the nearest stanchion. An experienced man was always stationed on the summit as "crow," to look out for the sea, and give warning when a wave was likely to sweep over the rock; when the men would hold on, head to the sea, while it washed over them. Then, when the wave had passed over, and there was a temporary lull, picks, hammers, and jumpers, some over twenty pounds in weight, were frequently found to have been washed away. An additional dan-

ger to the men was in the necessary blasting of the rock with gunpowder—their only protection from the showers of shattered fragments of rock being a temporary pent-house, formed each time they landed. In building light-houses, the progress of the work must always depend upon the humor of the weather. Very often it is impossible to land on the rock at all; and, when you do, you may often find a large portion of the last day's work washed away; and this has to be done all over again. In the eight working seasons occupied over the Wolf-Rock light-house, there were two hundred and sixty-six landings; and of time spent in labor, eight hundred and nine and a half hours—being only one hundred and one working-days, of ten hours each, for the erection of the tower. In this light-house, a fog-bell, weighing five hundred-weight, is fixed on the lantern-gallery. It is struck by two hammers worked by machinery. For the purpose of giving the signal a distinctive character for the station, the machinery is arranged for striking the bell three blows in quick succession, at intervals of fifteen seconds. The cost of building this light-house, considering the exceptional difficulties, may be reckoned moderate—being about sixty-two thousand seven hundred and twenty-six pounds.

Worth, the Man-milliner of Paris.

Ambassadors' wives and court-ladies used to go to take tea with the fellow, and dispute the honor of filling his cup or putting sugar into it. I once went into his shop—a sort of drawing-room hung round with dresses; I found him lolling on a chair, his legs crossed before the fire. Around him were a bevy of women, some pretty, some ugly, listening to his observations with the rapt attention of the disciples of a sage. He called them up before him like school-girls, and, after inspecting them, praised or blamed their dresses. One, a pretty young girl, found favor in his eyes, and he told her that he must dream and meditate several days over her, in order to find the inspiration to make a gown worthy of her. "Why do you wear these ugly gloves?" he said to another; "never let me see you in gloves of that color again." She was a very grand lady, but she slipped off her gloves, and put them in her pocket with a guilty look. When there was going to be a ball at court, ladies used to go down on their knees to him to make them beautiful. For some time he declined to dress any longer the wife of a great imperial dignitary who had not been sufficiently humble toward him; she came to him in tears, but he was obdurate, and he only consented at last to make a gown for her on condition that she would put it on for the first time in his shop. The empress, who dealt with him, sent to tell him that if he did not abate his prices she would leave him. "You cannot," he replied, and, in fact, she could not, for she stood by him to the last. A morning dress by this artist, worth in reality about four pounds, cost thirty pounds; an evening dress, tawdry with flounces, ribbons, and bad lace, could not be had under seventy pounds. There are about thirty shops in Paris where, as at this man-milliner's, the goods are not better than elsewhere, but where they cost about ten times their value. They are patronized by fools with more money than wits, and chiefly by foreign fools. The proprietor of one of these establishments was complaining to me the other day of what he was losing by the siege; I told him that I sympathized with him about as much as I should with a Greek brigand bemoaning a falling off of wealthy strangers in the district where he was in the habit

of carrying on his commercial operations.—*Labouchere's Diary of a Besieged Resident in Paris.*

Coloring Pipes.

Consider, in the first place, a meerschaum pipe in its native purity of hue. It is a symbol of one of the most universal, and, we might almost add, one of the most intellectual pleasures known to humanity. From a moral point of view, it is suggestive of peace, of the calming of over-irritated nerves, and of general good-will toward mankind. Tobacco supplies one of the few comforts by which men who live by their hands solace themselves under incessant hardships, while it equally gives relief to the excited brain of those who depend upon intellectual labor. In all the wide scale of human beings which intervenes between the red Indian and the German philosopher, there is no rank for which tobacco does not soften the harsh edges of daily life. Next to the man who invented sleep, we should pay gratitude to the benefactor who discovered this method of entering the confines of sleep during our waking hours. So great and universal a pleasure should surely have its outward signs to recall the memory of past happiness. Some of the highest artistic faculties have been called out in the effort to render more attractive the instruments which minister to the more sensual and dangerous passion for intoxicating drinks. If it is worth a man's while to ornament a drinking-cup with the labor of months or years, why should not an equal attention be bestowed upon pipes? The meerschaum is to the ordinary clay what the diamond is to agate, or gold to copper; but it must be admitted, if we judge from the specimens exhibited in tobaccoists' shops, that it has hitherto employed only a very inferior order of talent. Yet the meerschaum has the special glory that, if skilfully handled, it is ornamented in the very process of enjoyment. It would require no ordinary power of language to point out the lovely gradation of colors through which the virgin white of the primitive material gradually deepens through a delicate amber down to the richest chestnut, and finally to the blackness of midnight. The great qualifications for success, in this as in every other art, are thoughtfulness, attention, and a deep sense of responsibility. No man should choose a pipe recklessly, or smoke it with a regard only to the immediate pleasure; his great end should be always more or less distinctly before him; once fairly launched on the path of success, he should not allow himself to be hurried or deviated from his aim; and, when at length his labors have produced the desired result, when the pipe is arrayed in all its glories of color, and every danger has been evaded by unremitting care, he should place it before him on some safe pedestal, as a record of former successes, and a stimulus to new efforts.

The Great Indian Famine.

The *Gazette of India* has just published a painful but deeply-interesting report of the *tir kul*, or threefold famine of grass, grain, and rain, which fell in 1868-'69 with frightful severity on one hundred thousand square miles of Rajpootana, surpassing in intensity any which has occurred since 1812, and almost equalling that of 1661, of which the record is preserved that three-quarters of the cattle died, and that man ate man. The visitation having been chiefly in native states, accurate statistics are not forthcoming; it is impossible, therefore, to come to any quite accurate conclusions as to the mortality which the famine caused directly or indirectly. The scanty crops which in spite of drought struggled up were swept off the face

of the earth by a plague of locusts; cholera fastened on the starved people, and a terrible fever followed, striking down the entire population. The deaths from this latter cause alone are put down at twenty per cent. of the inhabitants, while in some of the Marwaree districts they rose as high as one-third. Taking the most moderate of the statistics furnished, the local authorities calculate that in Marwar, and Ajmere, and the other districts, no less than one and a quarter million of human beings died of disease and starvation. What could be done to alleviate suffering was done; but it was very little, for the stricken districts were cut off from the possibility of adequate aid. How this happened is explained in the report, which says that the Rajpootana famine bore a strong resemblance to the Orissa famine in one particular; that for some months, though from a different cause, Rajpootana, like Orissa, was shut off from the receipt of supplies at the most critical period of the year. In Orissa this arose from the impossibility of ships approaching the coast to unload during the monsoon months. In Rajpootana the same result was produced by the utter failure of forage, the price of which was in many places actually dearer than grain, so that no carts could travel, nor could the pack-bullocks of the Bunjars, of which there are hundreds of thousands in Rajpootana and Central India, traverse the country. The result was the same. The sea in one case, and the want of grass in the other, isolated the famine tract from the rest of India. It must be admitted that great efforts were made to relieve the sufferers. The chiefs of Oodeypore and Jeypore set a noble example, which was followed by almost every other chief whose states were stricken, and by many who were beyond the famine limit. Famine-relief works were started and maintained at comparatively enormous expense during the whole of the visitation; the United Presbyterian Mission, which has made Rajpootana its field for missionary enterprise, labored both in purse and person; the Marwarees in Bombay, acting with the Bombay Government and the Chamber of Commerce, sent liberal contributions; and the Government of India expended in relief works, for the four hundred and twenty-six thousand inhabitants of its own province of Ajmere, fifteen and a quarter lakhs of rupees, or nearly three years' gross revenue of the country.

Burning of Widows.

Europeans have always been led to suppose that, by the act of *suttee*, Hindoo wives declared their undying attachment to their husbands, but Dr. Chever, in his recent work on Indian medical jurisprudence, traces the custom to a very different origin. He brings forward authorities to show that the Bramins themselves invented the law as a means of self-protection against their wives. Before its introduction the wives were in the habit of avenging themselves on their husbands for neglect and cruelty by mixing poison with their food, and at last things came to such a height that the least matrimonial quarrel resulted in the husband's death. An easier remedy for the evil might have been found in permitting the wife to eat out of the same dish as the husband, but this would have involved too wide a departure from the customs of society; and it must be admitted that there is a peculiar refinement of cruelty in the expedient adopted which would commend itself to the Asiatic mind. Of late years the law of *suttee* has been occasionally set at defiance, but the widow cannot altogether escape the consequences of her husband's death. His family degrade her, and put her to the most menial duties in the house.

Foreign Items.

THE eccentric old Duke Charles of Brunswick, whose fondness for curious diamonds has made him so well known, intends to remove from Geneva, where he resides at the present time, to Vienna; he has determined not to make the journey by rail, but to travel in a sort of strong box on wheels, containing the safe with his diamonds, and escorted by four armed horsemen.

Emile de Girardin, although now a septuagenarian, has resolved to establish a new daily paper in Paris as soon as the revolutionary troubles are over, and to write two columns of editorial matter for its morning and evening editions. He spoke to Louis Blanc about furnishing articles for the new paper; but the latter is to contribute exclusively to George Sand's new daily paper. So says the Versailles correspondent of the *Gazette de Bruxelles*. The *Liberté*, Girardin's old paper, has been sold to Francisque de Sarcay.

Henry von Sybel, the historian of Bonn, contributes regularly to two German, one French, one Russian, and one English magazine. But Karl Blind surpasses him in this respect. He corresponds for papers published in six languages, and is, besides, a frequent contributor to the magazines and reviews of England, Germany, and France. The "Correspondent's Manual," a small pamphlet, published recently at Amsterdam, in Holland, gives these details.

The royal family of Belgium is singularly unfortunate. The king is partially blind, and suffering at times dreadfully from photophobia. The queen is afflicted with dropsy of the heart. The king's brother, the Count of Flanders, is stone-deaf. His wife, the beautiful Princess of Hohenzollern, is consumptive; and Charlotte, the king's sister, is insane.

Felix Pyat's grandfather was hanged in France by order of the Count d'Artois, afterward Charles X., and the grandson says that the memory of that dark deed, ever since he was able to think, made him a decided advocate of tyrannicide.

In a prize contest among the photographic artists of the principal cities of Germany and Austria, the first premium was awarded by the prize jury, sitting at Stuttgart, to a Munich firm, and the second to a photographer from Frankfort-on-the-Main.

Pope Pius IX. speaks four languages fluently, though all of them with a strong accent. He is, besides, a good Greek and Hebrew scholar. He was, at one time of his life, engaged in writing a Greek-and-Latin dictionary, but never finished it.

Madame Dejazet, the great French actress, is dead. Up to her seventieth year she appeared in youthful rôles. Alexandre Dumas offered her, at one time, his hand, but was rejected. Scribe wrote for her ten or twelve of his most successful and popular plays.

It is proposed to convert the Walhalla, built near Ratisbon by King Louis I., of Bavaria, into a mausoleum for the Emperors of Germany. The idea is believed to have originated with the young King of Bavaria. Some German papers express strong opposition to the idea.

Perlsén, the Swedish author, who has acquired sudden celebrity by the only book he has written, a small volume of fables, has received a decoration from the King of Sweden.

and been chosen member of the Academy of Upsal.

A posthumous letter of Henry Heine, the great German poet, relates how that charming ballad of his, "*Ich weiss nicht, was soll es bedeuten*," originated. It took him but fifteen minutes to write it. It is now sung wherever Germans live.

Three Americans intend to open a large hotel at Cronstadt, near St. Petersburg, a place which, it is generally believed in the commercial circles of Europe, will soon assume great importance and rapidly increase in population.

A curious fact about book-publishing in the kingdom of Greece is, that, of every book issued at Athens, nearly three times as many copies are sold out of the country as in Greece itself.

It is said in literary circles, in Berlin, that less than eleven hundred copies of Theodor Mommsen's celebrated "History of Rome" were sold by the German publishers. Abroad, the sales were much larger.

The King of Greece has recently been in feeble health, the climate of the country not agreeing with him; and it is said that he seriously intends following the example of King Otho, and abdicating his crown.

The late *Ostermesse* of the German book-trade, at Leipzig, was very unsatisfactory to the publishers. The prospects of the book-trade, in that country, are looked upon as rather gloomy.

The critic of the *Neue Wiener Freie Presse*, one of the leading literary authorities in Germany, speaks very highly of the opening chapters of Louisa Mühlbach's new novel, "Mehemet Ali."

The publisher of the *Revue des Deux Mondes*, which was suppressed by the Communists, offers that celebrated review for sale. It has been exceedingly profitable from the first day of its publication.

Jules Levin's curious novel, "Twenty Thousand Miles under the Ocean," is meeting with great success, despite the unfavorable aspect of the times.

A water-color portrait of the Emperor of Russia, painted by the empress, was recently sold for six thousand rubles at a patriotic fair, in the city of Kiev.

Mendelssohn-Bartholdy's son is a university professor in Heidelberg, and one of the most prolific writers for the magazines of his country.

The two Cassagnacs have returned to France. They live in retirement at Nîmes, but propose to return to Paris at an early day.

Offenbach received a larger copyright for "Barbe Bleue" than for any of his other operettas.

Senator Schurz, of Missouri, has been elected honorary member of the Historical Society of Austria.

The Schiller-literature of Germany embraces over four thousand works.

The widow of Scribe, the French dramatist, is dead. She left a very large fortune.

A weekly paper, named *The North*, is about to be issued in Iceland.

Varieties.

THE new express train from Plymouth to London will probably be the fastest train in the world in the part of its journey which lies over the Bristol and Exeter and Great Western Railways. Leaving Exeter at 10.30, it is timed to reach Paddington at 2.45; including a stoppage of five minutes at Bristol, and the inevitable and vexatious ten minutes at Swindon, the journey of one hundred and ninety-four miles will occupy four hours and a quarter. The Irish limited mail, hitherto considered the fastest train, occupies six hours and thirty-five minutes between London and Holyhead, being at the pace of only one hundred and seventy miles in four hours and a quarter. The fastest train on the Great Northern Line is between London and Peterborough, seventy-six miles, which is done in one hour and thirty-seven minutes; but the Great Western's accelerated express will run from Swindon to London, seventy-seven miles, in one hour and twenty-seven minutes.

When you see Whittier, you see instantly it is the Whittier of the pictures, only more thin and gray. The pictures give you a larger head, yet not so fine in the lines that mean most in a man of genius; and no picture can give you the eyes, smaller than those we see in the portraits of Burns, but dark, intense, and tender—and when he speaks of what touches him intensely, all aglow with the light of his soul—such eyes, indeed, as you only see now in a picture by one of the great old masters.

A San Francisco journalist, desiring to give his readers a faint idea of the performance of a band of Chinese musicians, asks them to imagine themselves "in a boiler-manufactory where five hundred men are putting in rivets, a mammoth tin-shop next door on one side, and a forty-stamp quartz-mill upon the other, with a drunken *charivari* party with six hundred instruments in front, and four thousand enraged cats on the roof."

When Professor Felton, reading "A Midsummer Night's Dream" to the captain of the ship of which he was a passenger, came to the description of Oberon sitting on a promontory listening to a mermaid on a dolphin's back, the seaman was disgusted. "The dolphin's back," said he, "is as sharp as a razor, and no mermaid could possibly ride the beast unless she first saddled him!"

A clergyman at Cairo, Illinois, expressed lately his contempt of nickels in his Sunday collection, and positively forbade any of his congregation from contributing anything under the denomination of five cents. "Save your cents," said the good man, "until you have five before you put your hands in this box. The widow's-mite business is played out here."

It is not likely that the suit brought in the United States Circuit Court, at Washington, to test the right of women to vote under the fourteenth amendment, will be reached for argument before next November. Then it would go to the Supreme Court and remain there, probably, for some years before a decision could be had.

A local report of the period: "Mr. Collins, of Hartford, bought a ferocious watch-dog. Mr. Collins came home late that night. His wife says that his trousers can't be mended. The dog's skin is for sale cheap. Mr. Collins hopes to be able to sit down in a few weeks."

A clergyman was lately depicting before a deeply-interested audience the alarming increase of intemperance, when he astonished his hearers by exclaiming, "A young man in my neighborhood died very suddenly last Sunday while I was preaching the gospel in a beastly state of intoxication!"

A Western editor, who doesn't know much about farming, anyway, suggests that, for garden-making, a cast-iron back, with a hinge in it, would be an improvement on the spinal column now in use.

Why is a baby like a sheaf of wheat? Because it is first cradled, and then thrashed, and finally becomes the flower of the family.

A school-girl was recently asked at an examination by the clergyman, to tell him what Adam lost by his fall, and, when pressed, she replied, "I suppose it was his hat!"

A young lady of Logan County, Kentucky, has advertised "for sealed proposals for her hand and heart." It is not stated whether she will take the lowest "tender."

The Providence *Journal* says, "Poverty is in most cases a blessing." And so it may be; but those who have enjoyed it for a great many years like to see it brighten by taking its flight.

In London, workmen are carried on the railroads ten miles, once a day each for a week, for twenty-five cents.

Never owe any man more than you are able to pay, and allow no man to owe you more than you are able to lose.

Why will folks pay so much for rent when they can get a house maid for three or four dollars?

The woman that maketh a good pudding in silence, is better than one that maketh a tart reply.

The chief agent in producing the crevasses in the levees on the Lower Mississippi is the crawfish.

Othello was not a lawyer, although he was a tawny general of Venice.

An oyster leads a placid life until it gets into a stew.

The artist's adieu to his picture—You be hanged!

Why is your chambermaid immortal? She returns to dust every day without dying.

Forty-seven women are editorially connected with the New-York press.

"Long and successful reign"—The deluge.

When the beer runs out does it hop?

The board of health—A plain diet.

A constant gleaner—The tax-gatherer.

Parental acres—The old man's corns.

The Museum.

THE Waraus are one of the numerous savage tribes inhabiting Guiana, South America. The climate of this district is so warm that houses are little needed, all that is required being a simple roof above the head. The ordinary kind of hut is nothing more than a mere shell, a sort of barn without the walls, supported on posts, and thatched with leaves. From the posts and rafters are hung the personal goods of the natives, such as fans, paddles, clubs, blow-guns, bows and arrows, and similar articles. Between the upright posts, and sometimes from the transverse beams, are suspended the hammocks, some of which are almost invariably occupied, as the native has a natural genius for lying in his hammock. The site selected for a house must combine several requirements. In the first place, it must be near a stream, so that the women may not have more trouble than needful in fetching water for the use of the household, and that the canoe may be within easy reach of the house when the owner wishes to set out upon one of the frequent migrations which take place among these tribes. It must be a spot which is rather out of the way. The native Guianan likes peace and quietness, and has a strong objection to being disturbed, the apathy of his nature being supplemented by an inveterate shyness, which makes him keep aloof from strangers. It must also be a spot where the ground is light and sandy, and where the very slight cultivation needed in this land can be easily carried on. The house being built, the next business is to prepare a field for the cultivation of yams and cassava, and this is

the only hard work the men will condescend to do. The ground is already occupied by trees, but this is of no consequence to the native agriculturist. Having selected a convenient spot, he cuts down the trees, ingeniously contriving that the fall of one shall bring down several others. This is done at the beginning of the hot season, i. e., somewhere in August. The tropical sun soon dries the fallen trees, and, when they are sufficiently parched for

Architecture of the Warau, Guleana.

the purpose the Indian sets them on fire, a process which rapidly consumes all but the trunks and the largest branches. He has now done his share of the work, and leaves the rest to the women, who have to clear away the debris as far as they can, and to do all the digging, planting, and weeding that is needed. The house itself is built by the women, who do nearly all the labor, heavy work being beneath the character of a man to undertake.

THE PATENT FIELD AND LAWN TENT,

COMPOSITE IRON WORKS CO.,

MANUFACTURERS OF

Railings, Gates, Wire Farm Fence, Garden and Lawn Ornaments, Vases, Fountains, Statuary, etc.,
109 MERCER STREET, NEW YORK.

FOR CROQUET AND BASE-BALL.

Volume for 1870 Just Published.

THE AMERICAN ANNUAL CYCLOPÆDIA,

AND REGISTER OF IMPORTANT EVENTS FOR THE YEAR;

Embracing Political, Civil, Military, and Social Affairs; Public Documents; Biography; Statistics; Commerce; Finance; Literature; Science; Agriculture, and Mechanical Industry.

This work was commenced in the year 1861, and is published one volume annually, in the same style as the "New American Cyclopædia." Each volume is intended to be a Cyclopædia of the material and intellectual development of the year, and embraces the political, civil, military, and social affairs of all countries; important Public Documents; Biography; Statistics; Commerce; Finance; Literature; Science; Agriculture; Mechanical Industry, etc. In a word, each volume is a Cyclopædia of the results of its year.

The volume just issued, in addition to the usual information on all the Civil, Political, Industrial Affairs of each State, and of the whole country, contains details of the U. S. CENSUS (so far as completed), a full Account of the Origin and Progress of the GERMAN-FRENCH WAR, and a very full exhibition of the present state of Europe, Population, Nationalities, Wealth, Debts, Military Force of the different Countries, and an Explanation of all the existing European Questions, are presented.

The Discoveries, Events, and Developments, of the year are fully brought up, together with the History and Progress of all Countries of the World during the year. The volume is illustrated with Maps, and fine Steel Portraits of General ROBERT E. LEE, General Von MOLTKE, and King VICTOR EMMANUEL.

One large octavo volume. Price, in Cloth, \$5.00; in Library Leather, \$6.00.

SOLD BY SUBSCRIPTION.
